Right of way agents of the Oregon & Washington R. R. have been busy securing options on the right of way in Cowlitz Valley near Mayfield and Silver Creek, Wash., for the construction of a line for which surveys have already been made. J. R. Holman, Seattle, Wash., is assistant General Manager of the company.

Winston Bros. & McDougall, contractors of Minneapolis, Minn., who have the contract for double tracking the joint Hill-Harriman main line between Kalama, Wash., and Tenino, are making rapid progress on the work. The company is also bidding on the Point Defiance line of the Northern Pacific.

W. L. Darling, Chief Engineer, Northern Pacific Ry., St. Paul, Minn., is reported to have stated that bids were received for the construction of the company's water grade line from Tacoma, Wash., via Point Defiance and the Narrows to Tenino through the eastern portion of Thurston County, and that construction work will begin June 15.

An announcement has been made that the Chicago, Milwaukee & Puget Sound R. R. officials that a branch line would be constructed through the North River country to Centralia, Wash., with Portland, Ore., as the ultimate terminus. Contract for six miles of the road has been let to Andrew Peterson, Aberdeen, Wash.

Right of way has been secured, it is said, from Beverly to Hanford, Wash., for the branch line of the Chicago, Milwaukee & Puget Sound R. R., and construction work will be started soon. E. J. Pearson, Seattle, Wash., is Chief Engineer of the company.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Wisconsin & Northern R. R. has secured about 50 acres of land at Appleton for terminal purposes. The railroad, which is in operation between Crandon and Shewano, is to be completed to Appleton during the coming summer, it is said.

The R. Connor Co. has purchased the land and timber owned by the Mosinee Land Co. in the town of Emmet and will extend its logging road so as to haul the logs to Stratford to be sawed into lumber. The land comprises some 3,000 acres of virgin forest.

The State Railroad Commission will hold a hearing at Madison, on June 6, on the application of the Soo, for authority to build a line into Superior and through that city to its ore docks on St. Louis bay to enable it to compete with the Great Northern and the Northern Pacific in the ore carrying business. Including the ore docks and other facilities in that connection the 6.38 mile extension is estimated to cost $780,000.

Council Harbor Committee of Racine has reported in favor of making an appropriation of $5,000 for dredging the harbor.

Rapid progress is being made on the double track work of the Chicago, Milwaukee & St. Paul R. R., between Wabasha, Minn., and La Crosse, Wis. A dredge boat has been stationed near Whitman and proves very serviceable for building up the right of way by pumping sand from the bottom of the river to the new track through a pipe. The completion of this stretch of double track will give the company a double track line from LaCrosse, Wis., to St. Paul, Minn.

At a meeting recently held at Patch Grove, Wis., Carson Scott, Engineer, stated that 19 miles of track would have to be constructed on the proposed line between Patch Grove and Mt. Hope, and that the cost including the right of way would be about $200,000. Both towns are to vote bonds. W. E. Lewis, Patch Grove, Wis., and Jay F. Morse, Mt. Hope, are interested.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Canadian Pacific Ry. is planning to replace many of its wooden snow sheds through the Rocky Mountains with steel structures. Plans for the new structures have been prepared.

The Great Northern Ry., according to reports, is to double track its line from Portage La Prairie, Man., to Grand Forks, N. Dak.

The Toronto Construction Co., of Toronto, Ont., has been awarded the contract for the construction of the line which the Canadian Pacific will build from Coldwater to Atherly Junction, to give direct connection with Orillia. The contract is said to amount to about $500,000.

Mackenzie & Mann secured in Europe for use in the development of the interests of the company the sum of $40,700,000. Of this money $5,000,000 are for debentures of the Canadian Northern R. R. One million is to go to develop the Winnipeg Street Railway, three millions for steamships, seven and a half millions will be used in the recently-acquired timber mill and timber rights in British Columbia by the Western Canadian Lumber Co., fourteen millions will be expended on the Dunsmuir collieries in the same Province, six millions are to be used in the Brazeau coal fields and railway in Alberta, and the balance, $4,700,000, will be utilized for the building of the Duluth, Winnipeg & Pacific Railway from Virginia Mines, 70 miles, into Duluth, to establish a through connection with the Chicago & Northwestern Railway into Chicago. Wm. Mackenzie and D. D. Mann, Toronto, Ont., are the heads of the above interests.

The National Transcontinental Railway Commission reports that active construction work has now been started on the only gap in the line not hitherto under way—namely, the section between Nepigon and Abitibi. Construction is now being pushed along the whole line from Moncton west to Superior Junction, and the commission expects the road will be ready for operation between Winnipeg and Moncton for the wheat-carrying season of 1912. The completed portion of the line from Winnipeg to Superior Junction will be in active operation by the time the wheat begins to move next September.

The Grand Trunk Pacific has purchased the north end of Courtenay bay for terminals at St. John, N. B. Borings are at present in progress, with the view of necessary dredging to provide a harbor in the bay.

The following summary of the work to be done this year by the Canadian Northern Ry. was given by D. D. Mann, at Winnipeg: Upwards of $4,000,000 will be expended on new equipment this year, and 600 miles of steel will be laid. The work of relaving the old track with heavier steel from Port Arthur to Gladstone will be completed and millions will be expended in putting the roadbed of the company in first classs condition. Almost all the wooden bridges which remain on the line between Winnipeg and Port Arthur will be cut out and replaced with permanent steel structures. A dump of solid rock will be built for a mile and a half across Rainy Lake, and next season the company will have a double track on this piece of road.

The application of the Toronto Ry. Co. for permisison to lay tracks on certain streets of the city of Toronto, has been granted by the Ontario Railway and Municipal Board. The company propose to lay rails on Victoria St., Wilton Ave., Shuter, Teraulay, Agnes, Anderson, St. Patrick and Harbord Sts., and University Ave.

The Canadian Pacific R. R. has awarded the contract for an extension of its irrigation system into the eastern section of the irrigation block to James McDonnell & Co. of Vancouver, B. C., with whom are associated Winter, Boomer & Hughes and Grant, Smith & Co., all of Spokane, Wash. The contract is for $5,230,000, and includes canals calling for excavation of 28,000,000 cu. yds. of earth. The contract price is about $250,000, under the estimate of the C. P. R. and carries a time limit of five years. The work is to be started immediately and will irrigate 540,000 acres.

Haney, Quinlan & Robertson, of Toronto and Montreal, have been awarded the contract for section 6 of the Trent Valley Canal north of Campbellford. The contract price is about $600,000.

Tracklaying on the mountain division of the Grand Trunk Pacific out of Prince Rupert has been commenced, and it is expected 100 miles will be completed to Copper River by the end of July.

Mexican Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The Mexican Government has signed the concession for the construction of a railroad from the Isthmus of Tehuantepec to connect with the United Railroads of Yucatan at the City of Campeche. This is the concession granted to William Prim Wood, City of Mexico, noted previously in these columns. The road is to be built by the Vera Cruz, Tabasco & Campeche Ry. Construction Co., the officers of which are as follows: Donato Chapearpuge, president; William Prim Wood, vice-president; J. J. Lemmens, treasurer; A. L. Van Antwerp, secretary. The location of the proposed road is not complete, but the company expects to send out an engineering party at once and have the route completed and agreed on before the expiration of the six months' time limit. Two routes have been suggested, the first for the road to keep close to the foothills, thus avoiding much of the lowlands to the north, at the turn of the Yucatan peninsular. The other is to penetrate the lowlands further to the north, the road thus passing through some of the biggest and most important cities in the hot country, between the isthmus and the peninsular.

The Pacific Improvement Co., A. D. Shepard, San Francisco, Cal., owner of the Guatemala Central R. R. is to extend the railroad to the Mexican border where it will form a connection with the Pan-American R. R. The extension will be about 20 miles long.

The contract entered into between Leandro Fernandez, representing the department of communications and public works, and Lic. Francisco Alfaro, representing A. B. Adams, Incorporated, for the construction of a railroad starting at Puebla, Mex., and passing by the mines of coal at Tezcatlan and Tlaxiaco, Oaxaca, and ending at Lake Chacahua on the Pacific coast, has been approved in all its parts. The Puebla & Pacific Railroad Co., of Mexico, has been incorporated in Wilmington, Del., with a capital stock of $25,000,000 and proposes the construction of the railroad. The incorporators are as follows: Alfredo B. Adams, New York City; C. Melton A. Astley, London, England; Alexander M. Vandeleur, London, England.

The Mississippi Central R. R., R. K. Smith, General Manager, Hattiesburg, Miss., is to construct large piers at Mobile, Ala. The railroad will enter Mobile over the tracks of the New Orleans, Mobile & Chicago R. R.

Dr. D. W. Day, of Hartselles, owner of Clear Creek falls in Winston county, has been with a civil engineer looking over the ground preparatory to making a survey for the railroad from Decatur to the falls, a distance of 80 miles.

The Bell Lumber Co. of Minneapolis, Minn., has been awarded the contract for poles, ties, etc., for five miles of street railway to be built at Aberdeen, S. Dak., by the Aberdeen Street Ry. Co., of which C. N. Herreid, Aberdeen, is Manager. Construction contracts are to be let at once, it is said.

The Carter Construction Co., Chicago, Ill., is stated to have begun construction work on its contract for building the Western Maryland extension from Cumberland, Md., to New Haven, Pa. The Carter Construction Co., will itself build the section from Cumberland to Savage Tunnel, a distance of

20 miles. Savage tunnel is about one mile beyond the Mason and Dixon line in Pennsylvania. It will be the longest tunnel on the extension—about 3,200 ft. There will be three tunnels in Maryland and two in Pennsylvania.

The Southern Power Co., owner of water powers in South Carolina and North Carolina, has filed a $10,000,000 mortgage, to cover improvements and extension of the company's power system in the two states and in addition supply funds for building an electric railway from Anderson, S. C., to Charlotte, N. C., via, Spartanburg and Greenville. Of the amount, $3,000,000 is to be immediately available, the remaining $7,000.000 in bonds to be issued from time to time as required. James B. Duke is President.

The New York, New Haven & Hartford R. R. has petitioned the Connecticut Railroad commissioners for permisison to eliminate 21 grade crossing in the town of Newton, Conn.

The Chicago, Memphis & Gulf R. R. Co. has filed articles of incorporation in all the states through which it will pass.

Officials of the New York Central Lines and C. W. Hotchkiss, General Manager of the Chicago, Indiana & Southern Ry., have been inspecting terminal properties at Port St. Joe, Fla., and this has given rise to the rumor that the New York Central is contemplating the construction of a southern line, with a view to handling traffic passing through the Panama Canal. It is said that the road for some time has been negotiating for valuable water frontage at Port St. Joe.

Capt. R. G. Ross, Jacksonville, Fla., has been awarded the contract for building up the shore end of the north jetty at the entrance of Biscayne Bay, Miami, Fla. The contract calls for about 500 yds. of Florida lime rock and the contract price was $3.40 per yd.

Eyre-Shoemaker, Inc., Arcade Bldg., Philadelphia, Pa., are preparing to begin work on their contract for the construction of the new Sand Patch tunnel near Cumberland, Md., for the Baltimore & Ohio R. R. The Baltimore & Ohio also let to the same firm the contract for the third tracking of the line from Yoder's Station to Philson's.

A bill is before Congress directing the Secretary of the Navy to construct a single track siding to the navy yard along the Anacostia River at Washington, D. C., at a cost of $200,000, in addition to whatever amount may be required to pay for land taken. The line is to be constructed to the Navy Yard at Washington.

BIDS ASKED

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Salinas, Cal.—Until 2 p. m., July 6, by T. P. Joy, Clerk of the Board of Supervisors, for the construction of a bridge across the Salinas River near Metz, in King City Road District, Monterey County. Lou. G. Hare, Salinas, Cal., is County Surveyor.

Brazil, Ind.—Until 11:30 a. m., by County Commissioners, for the construction of two bridges, one two-span concrete, 25 ft. each span, and one 60-ft. span steel superstructure. James L. Burns is Auditor of Clay County.

Newport, Ind.—Until 10 a. m., June 6, by County Commissioners, for the construction of a 40-ft. steel girder bridge, including abutments and retaining walls. H. T. Payne is County Auditor.

Hasting, Minn.—Until 10 a. m., June 8, by P. A. Hoffman, County Auditor, for the construction of a steel and concrete approach to the Cedar Ave. bridge located in Dakota County, Minn., crossing the Minnesota River.

Vicksburg, Miss. — Until noon, June 7, by Chancery Clerk, for the construction of wooden bridge or aprons near W. C. Mallett's place, in Red Bone Bottom. J. D. Laughlin is Clerk.

Marysville, Mo. — Until June 8, by County Commissioners, for the construction of about 50 bridges throughout the county.

Smithfield, N. C.—Until June 6, by Samuel T. Honeycutt, Clerk, County Commissioners for the construction of an iron bridge.

Massena, N. Y.—Until 2 p. m., June 4, by Town Committee, for furnishing all necessary labor and material for the construction of 600-ft. highway suspension bridge over the River de Grasse, Massena Center, N. Y. Barney S. O'Neill is Chairman of the Committee.

Syracuse, N. Y.—Until 1:30 p. m., May 31, by Board of Contract and Supply, for furnishing labor and material necessary for the erection of a steel plate girder bridge over Onondaga Creek at West Brighton Ave., Syracuse, N. Y. John J. Halloran is Secretary of the Board.

Fargo, N. Dak.—Until noon, June 2, by Arthur G. Lewis, County Auditor, for the construction of five bridges, repair of 6 bridges and the construction of 7 culverts.

Jamestown, N. Dak.—Until 2 p. m., June 6, by Andrew Blewett, County Auditor, for the construction of a concrete wall on the Main St. bridge in the city of Jamestown, N. Dak.

Wahpeton, N. Dak.—Until 2 p. m., June 6, by F. A. Burton, Auditor of Richland County, for the construction of three pile bridges. Separate bids will be received in wood or steel.

Cleveland, O.—Until 11 a. m., June 22, by Board of County Commissioners, for the construction of a culvert on the Center Ridge Road in accordance with Report No. 2629. John F. Goldenbogen is Clerk of the Board.

Steubenville, O.—Until 1 p. m., May 27, by J. M. Reynolds, County Auditor, for the construction of sub and superstructure of bridge No. 30, Smithfield Township.

Philadelphia, Pa.—Until noon, June 1, by Director of Public Works (readvertisement of bids called for May 17) for the construction of a bridge on the line of Fox St. over the Norristown branch of the Philadelphia & Reading Ry. It will be a steel I-beam structure, incased in concrete on concrete abutments and piers, 60 ft. wide and will have 1 30-ft. and 2 18-ft. spans. Willis Theble is Chief Clerk, Department of Public Works.

Arcadia, Tex.—Until 8:30 a. m., May 31, by B. F. Johnson, Secretary, Galveston County Drainage District No. 1, for the construction of between 50 and 100 bridges. R. W. Luttrell is Engineer of the District.

New Castle, Wyo.—Until noon, June 7, by Board of County Commissioners, for the construction of a bridge over the Stockade Beaver Creek near Owens side tracks on the M. W. road. J. W. Howell is County Clerk.

Greenock, Narva, Ont.—Until 3 p. m., May 26, by Thos. H. Purdy, Clerk, for the construction of two span flat arch bridge, 80 ft. long, at Stark's mill, Paisley.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Golden, Colo.—Until 9 a. m., June 9, by Board of Trustees, for concrete floors, suspended concrete floors, reinforced concrete building walls and wood roofing and composition covering for experimental ore dressing and metallurgical plant at the Colorado School of Mines. James T. Smith is Secy. of the Board.

Washington, D. C.—Until 11 a. m., June 6, by Col. F. L. Denny, Quartermaster, U. S. Marine Corps, Headquarters, Washington, D. C., for furnishing and installing mechanical equipment in the extension to marine barracks Navy Yard, Philadelphia, Pa.

Washington, D. C.—Steam Heating Plant—Until 2 p. m., June 14, by Department of Interior, Office of Indian Affairs, Washington, D. C., for furnishing the necessary materials and labor to construct and complete a central steam heating plant at the Wahpeton School, North Dakota.

Greenville, Ind.—Until 3 p. m., June 30, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, gas piping, heating apparatus, electric wiring and conduits of the U. S. Post Office at Greenville, Ind.

Francisco, Ind.—Until noon, June 4, by Trustee of Center Township, for the construction of two-story eight-room brick school house. Stanford Witherspoon, Township Trustee.

Boston, Mass.—Until 10 a. m., June 16, by Capt. A. M. Miller, Constructing Quartermaster, for the construction, including plumbing, heating, electric wiring and fixtures of an addition to the guardhouse at Fort Strong, Mass.

Minneapolis, Minn.—Until 3 p. m., June 27, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, of the United States Post Office at Minneapolis, Minn.

Clinton, Mo.—Until 3 p. m., June 23, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction complete, including plumbing, gas piping, heating apparatus, electric conduits and wiring, of the United States Post Office at Clinton, Mo.

Plattsmouth, Nebr.—Until 3 p. m., June 28, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, complete, including plumbing, gas piping, heating apparatus, and electric conduits and wiring of the United States Post Office at Plattsmouth, Nebr.

Bayonne, N. J.—Until 8:30 p. m., June 9 by Board of Education, Bayonne, N. Y., for necessary labor and material for the conustruction of Public School building No. 11, between West 23d and West 24th Sts. W. J. Tomlin is Secretary of the Board.

Elmira, N. Y.—Until 5 p. m., June 13, by Daniel Sheehan, Mayor, for the reconstruction and restoration of the City Hall.

Fort Porter, N. Y.—Until 11 a. m., May 31, by Lieut. Benj. F. Castle, Constructing Quartermaster for addition and alteration to guardhouse at Fort Porter.

Fort Porter, N. Y.—Until 11 a. m., June 4, by Lieut. Benjamin F. Castle, for construction including plumbing, heating, and electric wiring of one gymnasium and post exchange building.

Madison Barracks, Sacket Harbor, N. Y.—Until 2 p. m., June 9, by Constructing Quartermaster, Madison Barracks, Sacket Harbor, N. Y., for remodeling and replacing old plumbing in barracks for four companies at this post.

Cincinnati, O.—Until 2 p. m., June 15, by Lieut. Col. J. G. Warren, U. S. Engineer, Cincinnati, O., for constructing office building at dam No. 37, Ohio River.

Aiken. S. C.—Until 3 p. m., June 24, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, heating, gas piping, heating apparatus, electric conduits and wiring, of the United States Post Office at Aiken, S. C.

Ottawa, Ont.—Until 5 p. m., June 14, by Napoleon Tessier, Secy., Department of Public works, for the construction of an addition to the eastern Departmental Building, Ottawa.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Quincy, Cal.—Until July 8, by County Clerk, for the construction of a wagon road from the Denton ranch in Mohawk Valley to the boundary line between Plumas and Sierra Counties, near Gold Lake.

Fort Barrancas, Fla.—Until 11 a. m., June, 15, by Constructing Quartermaster, Fort Barrancas, Fla., for resurfacing the roadway from Bayou Grande to the Barrancas National Cemetery.

Clarksville, Ga.—Until 8 p. m., June 2, by J. H. Hicks, Mayor and Board of Councilmen for furnishing necessary labor and material for the construction of 8,000 sq. yds. of macadam pavement, 9,000 sq. yds. brick or concrete walk and 6,000 lin. ft. of curb and gutter. H. S. Jaudon is Engineer.

Boise, Idaho.—Until 2:30 p. m., June 11, by Constructing Quartermaster, for the construction of about 1,600 lin. ft. of macadam road, 20 ft. wide at Boise Barracks, Idaho.

Chicago, Ill.—Until 11 a. m., June 1, by Board of Public Improvements, for 24 contracts for street paving and improving.

Palmyra, Ill.—Until June 1, by Board of Commissioners of Highways, for the construction of hard road in this town. H. M. Gilbert is Town Clerk.

Bloomfield, Ind.—Until 2 p. m., June 7, by County Commissioners, for the construction of a gravel road in Stafford Township. Peter M. Cook is Auditor of Greene County.

Bluffton, Ind.—Until 1 p. m., June 9, by County Commissioners, for the construction of four gravel roads. O. D. Garrett is County Auditor of Wells County.

Brazil, Ind.—Until 11:30 a. m., June 6, by County Commissioners, for the construction of a gravel road 8,308 ft. in length. James L. Burns is Auditor of Clay County.

Greensburg, Ind.—Until 1 p. m., June 7, by County Commissioners, for the construction of macadamized roads in Sandcreek, Adams, Washington and Marion Townships. Frank E. Ryan is Auditor of Decatur County.

Kentland, Ind.—Until 1 p. m., June 6, by County Commissioners, for the construction of a macadam road in Jefferson Township. Elmer R. Bringham is Auditor of Newton County.

Mishawaka, Ind.—Until 6 p. m., June 20, by James W. Haverly, City Engineer, for paving North Mill St., from Second St. to Water St., with brick asphalt, bitulithic or creosoted wooden block, laid on 5 in. gravel foundation. The work includes 4,550 sq. yds. of pavement.

Mishawaka, Ind.—Until 6 p. m., June 6, by James W. Haverly, City Engineer, for improving the North side of West Second street, from a point 70 feet west of the West line of Alabama street, to a point 140 feet West of Logan street, by grading and paving that part not already paved and which is occupied by the Street Railway Tracks, with Vitrified Paving Blocks laid on a 6-inch gravel concrete foundation, tearing out the combination curb and gutter on the north side from Reddick street to a point 280 feet East of the East line of Milburn Place Addition, and constructing a 6x16 inch cement curb along the North side of said Second street from a point 70 feet West of the West line of Alabama street to a point 140 feet West of the West line of Logan street.

Rockville, Ind.—Until 1:30 p. m., June 7, by County Commissioners, for the construction of three gravel roads in Raccoon Township. H. A. Henderson is Auditor of Parke County.

Southport, Ind.—Until 7:30 p. m., June 6, by Board of Trustees for the construction of ce-

ment sidewalks on Church St. in said town. A. L. Barnes is Clerk of the Town.

Valparaiso, Ind.—Until noon, June 7, by County Commissioners, for the construction of a macadamized road in Porter and Liberty Townships, also one in Liberty Township. S. P. Corboy is Auditor of Porter County.

Winamac, Ind.—Until noon, June 7, by County Commissioners, for the construction of a road. Ellis S. Rees is Auditor of Pulaski County.

Albert Lea, Minn.—Until 5 p. m., June 7, by William Barneck, City Engineer, for the paving of Main St., with creosoted wood block, brick, mineral rubber or sandstone. The work includes 12,423.86 sq. yds. pavement and 4,388 cu. yds. of excavation.

Deerwood, Minn.—Until 1 p. m., June 1, by H. O. Skatrud, Town Clerk, for the construction of over 1 mile of grading work.

Billings, Mont.—Until 8 p. m., June 21, by J. D. Matheson, City Clerk, for the paving of certain streets in this city. The work includes approximately 9,856 sq. yds. of creosoted wood block pavement.

Kearney, Neb.—Until noon, June 10, by County Judge, for the improvement of several dirt roads in Thornton township. J. H. Dean is County Clerk.

Albany, N. Y.—Until June 6, by Board of State Highway Commissioners, for 39 road repair contracts. S. Percy Hooker is Chairman of the Board.

Brooklyn, N. Y.—Until 11 a. m., June 1, by President of Borough, Room 2, Borough Hall, City of New York, for thirteen street paving contracts, the largest being for regulating and repaving with asphalt pavement, concrete foundation, Henry St., from Atlantic Ave. to 4th Place. The contract includes the following approximate quantities: 14,200 sq. yds. of asphalt pavement, outside railroad area (five years' maintenance); 20 sq. yds. of asphalt pavement within railroad area (no maintenance); 40 sq. yds. of old stone pavement, to be relaid; 1,970 cu. yds. of concrete, for pavement foundation outside railroad area; 3 cu. yds. of concrete, for pavement foundation within railroad area; 7,940 lin. ft. of new curbstone, set in concrete; 250 lin. ft. of old curbstone, reset in concrete; 45 noiseless covers and heads, for sewer manholes; 14,110 sq. yds. of present pavement to be removed.

Dunkirk, N. Y.—Until June 2, by Common Council, for resurfacing with sheet asphalt West Fourth St. and paving Swan and Fox Sts., in this city. The work includes approximately 19,000 sq. yds. of pavement. R. H. Heppell is City Clerk.

New York, N. Y.—Until 11 a. m., May 26, by President Borough of Queens, City of New York, for seven sewer contracts, the largest being for sewer in Academy St., from Washington Ave. to Graham Ave., including the following approximate quantities, 700 lin. ft. 12-in. vitrified salt-glazed pipe sewer; 655 lin. ft. 15-in. vitrified salt-glazed pipe sewer 115 lin. ft. 12-in. vitrified salt-glazed culvert pipe; 1,512 lin. ft. 6-in. vitrified salt-glazed pipe sewer for house connections; 7 manholes, complete; 5 receiving basins, complete; 125 cu. yds. rock, excavated and removed; 2,000 ft. (B. M.) timber for bracing and sheet piling.

New York, N. Y.—Until noon, May 31, by President, Borough of Richmond, Borough Hall, New York City, for four street improvement contracts, the largest including the following approximate quantities: 15,000 sq. yds. of bituminous concrete pavement, with five (5) years' maintenance; 735 sq. yds. of vitrified brick pavement, including sand bed, and laid with cement grout joints, with five (5) years' maintenance; 11,400 sq. yds. of old foundation, prepared; 1,060 cu. yds. of concrete foundation; 1 cu. yd. of brick masonry; 8,010 lin. ft. of new 5-inch by 16-inch bluestone curbstone, furnished and set; 6,400 sq. ft. of old sidewalk, relaid; 30 sq. ft. of new flagstone, furnished and laid; 10 sq. ft. of new 3-inch bluestone coping, furnished and set; 15 sq. ft. of grating, reset; 100 lin. ft. of roof leader outlets, relaid.

Waterford, N. Y.—Until 8 p. m., May 26, by Town Superintendent, W. H. Conerty, at the office of Town Clerk, for the construction of an addition to the Hudson River road.

Carrollton, O.—Until noon, June 23, by A. K. Rader, Clerk of Village, for the construction of pavement of several streets throughout the village. The work includes the following approximate quantities: 6,415 cu. yds. of extra excavation; 18,904 sq. yds. vitrified block pavement; 14,504 lin. ft. of straight curb; 1,220 lin. ft. of circle curb; 760 lin. ft. of headers; 304 lin. ft. of 12-in. storm sewer complete; 2,610 lin. ft. of 18-in. storm sewer complete; 500 lin. ft. of 24-in. storm sewer complete; 11 catch basins complete; 11 inlet basins complete; 8 sewer manholes; 15 land monument covers.

Cleveland, O.—Until May 25 (readvertisement of bids asked April 20) by Board of County Commissioners, for grading, draining and improving the Independce Road No. 2 from Harvard Road to the property line between Henry Krapf and Peter Schmidt, about 8,910 ft. south of Harvard Road, in Newburg Heights Village. John F. Goldenbogen is Clerk.

Pittsburg, Pa.—Until noon, May 31, by County Controller, for the permanent improvement of Clifton and Bridgeville road and Library Extension Road No. 2. The first road will be paved with brick and the latter with macadam.

Fort Bliss, Tex.—Ice Plant.—Until Noon, May 31, by Capt. William H. Waldron, Constructing Quartermaster, for the construction of an ice

Sewers.

Bids are asked on following work, the notes being arranged alphabetically by states:

Perry, Ia.—Until 7:30 p. m., May 31, by Charles Wilson, City Engineer, for the laying of 1,050 ft. of 24-in. pipe, 635 ft. of 18-in. pipe, 250 ft. of 12-in. pipe, 700 ft. of 8-in. pipe and 600 ft. of open ditch, together with manholes and other necessary attachments.

Chicago, Ill.—Until 11 a. m., May 28, Department of Public Works, for furnishing necessary labor and material for the construction of sewers in 51st St. and 56th St., between Cornell Ave. and Lake Michigan. The work includes approximately: 825 lin. ft. of concrete invert in 51st St. sewer; 60 lin. ft. of 24-in. D. S. tile pipe sewer in 51st St.; 385 lin. ft. of 2½-ft. brick sewer in 56th St.; 385 lin. ft. of 18-in. D. S. tile pipe sewer in 56th St.; 305 lin. ft. of 12-in. tile pipe sewer in 56th St. B. J. Mullaney is Commissioner of Public Works.

Waukegan, Ill.—Until 8 p. m., May 26, by Board of Local Improvements, for two sewer contracts, known as Docket No. 356 and Docket No. 355. Alvah L. Rogers is Secretary and Fred Buck is President of the Board.

Portland, Me.—Until 10 a. m., June 4, by Capt. C. F. Humphrey, Constructing Quartermaster, Portland, Me., for the construction of additions to the water and sewer systems at Fort Williams, Me.

Ridgewood, N. J.—Until 8:30 p. m., May 31, by J. Blauvelt Hopper, Village Clerk, for the construction of a storm water sewer about 2,042 ft. of reinforced concrete construction and 3,430 ft. of vitrified pipe with necessary manholes, catch basins, etc. E. J. Harder is Village Engineer.

Fort Wingate, N. Mex.—Until 11 a. m., June 1, by Constructing Quartermaster, for the construction of a sewer system at the post.

Middleton, O.—Until Noon, June 7, by Charles C. Dell, Director Public Service, for the construction of concrete sewers including the following approximate quantities: 5 ft. 6 in. x 6 ft. 6 in., 1,992 ft.; 6 ft. 0 in. x 7 ft. 6 in., 2,808 ft.; 6 ft. 6 in. x 8 ft., 2,050 ft.

Youngstown, O.—Until noon, May 27, by Director of Public Service, for the necessary labor and materials for construction of sewers and grading Hiram St., between Caledonian St. and Union St. W. H. McMillin is Clerk.

Chattanooga, Tenn.—Until 2:30 p. m., June 7, by Board of Public Works, for the furnishing and installing of machinery and for the construction of a sewage pumping station. H. F. Van Dusen is Chairman of the Board.

Belton, Tex.—Until 8 p. m., June 14, by Belton Sanitary Sewer Co., for furnishing necessary labor and material for the construction of a system of sanitary sewers and sewage purification plant. The work includes as follows: The sewerage system, approximately 4,017 ft. of 12-in., 718 ft. of 10-in., 18,680 ft. of 8-in. vitrified pipe sewers, 67 manholes, 10 flush tanks. The sewage purification plant includes approximately 3,556 cu. yds. earth excavation, 366 cu. yds. rock excavation, 118 cu. yds. reinforced concrete, 80 cu. yds. plain concrete, 500 cu. yds. broken stone, piping and accessories. Charles B. Smith is Secretary of the company.

Huntington, W. Va.—Until 1 p. m., June 9, by Board of County Commissioners, for the construction of the lateral sewer in the alley between Washington and Virginia Aves., from 12th to 14th Sts. John Coon is Commissioner of Streets and Sewers.

Delavan, Wis.—Until 11:30 a. m., June 1, by E. H. Gormley, Chairman Committee on Streets for the construction of sewers in sundry streets.

Water Supply.

Bids are asked on following work, the notes being arranged alphabetically by states:

Corydon, Ia.—Until 7:30 p. m., June 6, by J. J. C. Bower, Town Clerk, for drilling an artesian well. A certified check for $300 must be filed with each bid. Iowa Engineering Co., Clinton, Ia., are the Engineers.

Chicago, Ill.—Until 11 a. m., June 1, by Board of Public Improvements, for six water service pipe contracts. Albert F. Keeney is President of the Board.

Dodge City, Kan.—Until 1 p. m., May 31, by P. I. Trebilcock, City Clerk, for furnishing material and labor for the construction of a water works plant. J. S. Worley Co., Reliance Bldg., Kansas City, Mo., are Engineers.

Savage, Minn.—Until June 5, by M. F. Zeller, Village Clerk, for the construction of four combination wells and cisterns for fire protection. Cisterns are to be 8 ft. wide and 10 ft. deep. Wells 20 ft. deep with 4-in. pipe.

Petersburg, Neb.—Until 4 p. m., June 10, by Village Board, for the construction of a water works system. William Ganiard is Mayor. Archer, Rollins & Co., Beals Bldg., Kansas City, Nebr., are Engineers.

Athens, Tex.—Until May 30, by City, for the necessary labor and material for the construction of complete water works system including pipe, valves and hydrants, tank and tower, water works pumps, air compressor, boilers, feed water heater and boiler feed pump.

Miscellaneous.

Bids are asked on following work, the notes being arranged alphabetically by states:

Hot Springs, Ark.—Electric Elevator.—Until 11:30, June 8, by Constructing Quartermaster, for the installation of a new electric elevator in the old Administration Building Army & Navy General Hospital and installation of a new electric elevator in the old hatchway.

Fort Barrancas, Fla.—Wharf.—Until 11 a. m., June 15, by Constructing Quartermaster, Fort Barrancas, Fla., for constructing an extension to the quartermaster's wharf at Fort Barrancas, Fla.

Springfield, Ill.—Tank & Tower.—Until Noon, June 8, by Board of Administration, Springfield Ill., for the construction of a tank and steel water tower at the Kankakee Hospital, Kankakee, Ill. Frank D. Whipp is Fiscal Supervisor. Official advertisement will be found elsewhere in this issue.

New Orleans, La.—Locks, Dam, Etc.—Until 11 a. m., June 15, by Lt. Col. L. H. Beach, U. S. Engineer, for the construction of a lock and dam and lock keeper's dwelling on the Bayou Teche, La. Work is also noted under confirmed reports.

Boston, Mass.—Electric System.—Until 10 a. m., June 6, by Capt. A. M. Miller, Constructing Quartermaster, Boston, Mass., for the construction of an electric lighting system at Fort Andrews, Mass.

Minneapolis, Minn. — Tunnels.—Until noon, May 31, by Board of Regents of the University of Minnesota, for the construction of about 3,600 lin. ft. of tunnel under the University Campus, together with five vertical shafts from the tunnel to the ground surface.

Omaha, Neb.—Steam Heating Plant.—Until 11 a. m., June 10, by Capt. F. C. Bolles, Constructing Quartermaster, for the installation of a steam heating plant in store house at Omaha Depot.

New York, N. Y.—Test Borings.—Until 4 p. m., June 2, by New York and New Jersey Interstate Bridge Commissions, 115 Broadway, Borough of Manhattan, New York, for making test borings at a proposed site of the Hudson River bridge over the Hudson River, at or about west of 109th St., and at or about West 179th St., New York City, to suitable points on the opposite shore in New Jersey.

Stillwater, Okla.—Railroad Work.—Until 10 a. m., May 25, by Chief Engineer Oklahoma Public Service and Interurban Lines, Stillwater, Okla., for the construction of approximately 13 miles of interurban line. Same to include separate bids on earth and bridge work. plant at this post.

Wheeling, W. Va.—Pier Work—Until 11 a. m., June 15, by Capt. F. W. Altstaetter, U. S. Engineers, for the construction of Poire dam foundations and extension of piers for Dam No. 13, Ohio River.

Ottawa, Ont.—Pier Extension—Until 5 p. m., June 3, by Napoleon Tessier, Secy., Department of Public Works, Ottawa, Ont., for the construction of an extension to the pier at Colchester, Essex County, Ont.

Toronto, Ont.—Railroad Work—Until Noon, June 8, by A. J. McGee, Secy.-Treas., Temiskaming & Northern Ontario Ry. Commission for clearing, grading embankment protection, driving of piles, building of culverts and laying of tile that may be required in connection with the construction of a branch line between North Bay and Nipissing Junction. Work is also noted under confirmed reports.

Toronto, Ont.—Chimney.—Until Noon, May 31, by G. R. Geary, Chairman, Board of Control, for the construction of a chimney at the pumping station of the filtration plant at the Island.

Excavation, Earth and Rock.

Bids are asked on following work, the notes being arranged alphabetically by states:

Washington, D. C.—Earthwork.—Until 10 a. m., June 8, by Department of Interior, U. S. Reclamation Service, for the enlargement of the Main South Side Canal near Boise, Idaho. Work includes about 342,000 cu. yds. of material.

Burlington, Ia.—Ditch Work.—Until 2 p. m., June 9, by County Auditor, for the construction of ditches in Des Moines County Drainage District No. 1. Harmon Engineering Co., Peoria, Ill., are the engineers. Work is also noted under Confirmed Reports. Official advertisement will be found elsewhere in this issue.

Des Moines, Ia.—Drainage Ditch.—Until Noon, June 20, by Board of County Supervisors, for the excavation and construction of drainage ditch located in Drainage District No. 11 in Elkhart Township. The work includes the moving of 53,471 cu. yds. of earth. H. B. Frase is County Auditor. Work is also noted under confirmed reports.

Chicago, Ill.—Concrete Work—Until 10 a. m., June 20, by Maj. Thos. H. Rees, U. S. Engineers, for the concrete superstructure, pile clumps, and interlocking steel sheeting in Michigan City Harbor, Ind.

Chicago, Ill.—Drains—Until 11 a. m., June 1, by Department of Public Improvements, for 11 contracts for the construction of drains. Charles V. Standish is Secretary.

Fairmont, Ill.—Drainage Work—Until 10 a. m., June 9, by Commissioners of Union Drainage District No. 1, G. W. Chenvront, Commissioner, for constructing a dredge ditch two miles long, requiring 50,822 cu. yds. of excavation; also for 7,930 ft. of tile work. Work is also noted under confirmed reports.

Jacksonville, Ill.—Levee Work—Until 11 a. m., June 2, by C. W. Brown, Engineer, Drainage District, Room 12, Scott Block, Jacksonville, Ill., for the construction of levees and ditches. Work is also noted under confirmed reports in this issue.

Aitkin, Minn.—Ditch Work—Until 10 a. m., June 6, by J. B. Lemire, County Auditor, for the construction of county ditch No. 14. The work is also noted under confirmed reports in this issue.

Redwood Falls, Minn.—Ditch Work—Until 1 p. m., June 2, by L. P. Larson, County Auditor, for the construction of Ditch No. 12. Work is also noted under Confirmed Reports.

Granite Falls, Minn.—Ditch Work—Until 10 a. m., June 1, by S. O. Tjosvold, County Auditor, for the construction of County Ditch No. 7, Yellow Medicine County. The work includes approximately 4,500 cu. yds. of material.

Fort Worth, Tex.—Levees, Etc.—Until 10 a. m., June 4, by Commissioners of Fort Worth Improvement District No. 1, of Tarrant County, Tex., at office of Robert G. Johnson, Chairman, Fort Worth National Bank Bldg., for the construction of levees and other improvements in the district. The work is also noted under Confirmed Reports.

Materials, Machines, Supplies, Etc.

Bids are asked on following work, the notes being arranged alphabetically by states:

Washington, D. C.—Dredge.—Until 10:30 a. m., June 27, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for the furnishing of a twin screw steel ladder dredge having a hopper capacity of 1,200 tons of spoil.

Washington, D. C.—Steel, Iron, Bronze, Etc.—Until 10:30 a. m., June 9, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for the furnishing under Canal Circular 585, the following materials: Steel, iron, bronze, copper, steel and copper tubing, pipe and fittings, exhaust valves, stovepipe, wire cable, rivets, bolts, nuts, taps, reamers, dies, bits, files, jacks, diaphragm pumps, boiler tube expanders, machinists' clamps, engine lubricators, oilers, gauge glasses, garbage cans, steam whistles, gaskets, leather fillet, leather belting, cardboard, etc.

Washington, D. C.—Lumber, Piles, Chain, Etc.—Until 10:30 a. m., June 17, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for furnishing according to Canal Circular 584, lumber, piles, and Vanadium Steel Chain.

Jeffersonville, Ind.—Motors—Until 10 a. m., June 1, by Quartermaster, for furnishing motors for depot use as follows: One 2-H.P.; one 5-H.P.; two 10-H.P.; one motor, 15 horse power and one triplex pump.

Jeffersonville, Ind.—Lumber—Until 10 a. m., May 31, by Depot Quartermaster, for furnishing lumber as follows: 30,000 ft. B. M., sap gum seasoned; 15,000 ft. No. 1 common; 15,000 ft. No. 2 common; 20,000 ft. B. M., cottonwood, seasoned.

Fort Leavenworth, Kan.—Boilers—Until 11 a. m., June 7, by Capt. William D. Davis, Constructing Quartermaster, for the installation of six new boilers and overhauling the central heating plant at Fort Leavenworth, Kan.

Tompkinsville, N. Y.—Oil—Until 2 p. m., June 10, by Lighthouse inspector, Tompkinsville, for furnishing mineral and lard oils of the quality required for lighthouse service for fiscal year ending June 30, 1911.

Philadelphia, Pa.—Boilers—Until May 26, by Inspector, Fourth Lighthouse District, Philadelphia, for furnishing two Scotch boilers for Fenwick Island Shoal Light vessel, No. 52.

Seattle, Wash.—Screens—Until 11 a. m., May 26, by Capt. E. C. Long, Constructing Quartermaster, 482 Arcade Annex, Seattle, Wash., for furnishing and installing certain window and door screens in nine buildings at Ford Ward, Wash.

CONTRACT LET.

The following contracts have been let recently:

BRIDGES.

Decatur, Ala.—Bridge.—Southern Bridge Co., Birmingham, Ala., for the construction of a steel bridge over Cotace Creek, Morgan County. The bridge will have a span of 85 ft., and a 12-ft. roadway on tubes.

Clinton, Ill.—Bridges—Decatur Bridge Co., at $1,575, for the construction of the Murphy bridge over Ten Mile creek, two and one-half miles north of Clinton, and at $1,700, for the construction of the Sprague bridge, three miles southwest of Clinton.

Elkinsville, Ind. — Bridge — Pan-American Bridge Co., Newcastle, at $2,600, for the construction of a steel bridge across the Muddy Fork of Salt Creek near this city.

Danville, Ind.—Bridges.—Gill & Stokes, North Salem, Ind., and Ira H. Martin, city, for the construction of bridges in the county.

Anamosa, Ia.—Bridge—Clinton Bridge & Iron Works, Clinton, at $7,650, for the erection of a new steel bridge across the Wapsipinicon river near the boundary line of Hale and Oxford townships; V. L. Hansen, Monticello, at $2,300, for building the abutments to the bridge.

Federalsburg, Md.—Bridge—Luten Bridge Co., York, at $16,000, for the construction of a reinforced concrete bridge over the northwest fork of the Nanticoke river, this city.

Mankato, Minn.—Bridges—County commissioners have awarded the following bridge contracts to Hennepin Bridge Co., of Minneapolis: In Danville, at $1,435, 50 ft. span; in Pleasant Mound, at $673, 24 ft. span over Marble creek; in Danville, at $650, 28 ft. span in section 30; in Mapleton, at $1,070, three 16 ft. spans in section 26; in Mapleton, at $1,694, 60 ft. span over the Maple river; in Pleasant Mound, at $2,118, 60 ft. span over Willow creek.

Rome, N. Y.—Bridge—Frank W. Tuthill, at $3,437, for the construction of the abutments and wing walls of the proposed E. Bloomfield St. bridge across Mohawk River.

Jacksonville, Pa.—Bridge—P. J. McGovern, at $9 per cu. yd., for the construction of the concrete bridge over Altman's run in this city.

Ridgeway, Pa.—Bridge—Will Dickinson, city, for the construction of a 92 ft. span bridge across Elk Creek, three miles east of this city, on the Ridgeway & St. Marys road. The bridge will be of concrete throughout, requiring 15 tons of twisted steel bars for reinforcement and will be of the arch girder type, with a 16 ft. roadway.

Lancaster, Pa.—Bridge—Nelson Merydith Co., Chambersburg, at $3,519, for the construction of a bridge over the Conestoga Creek at Rupp's Mill, West Earl. The bridge will be of reinforced concrete.

Galveston, Tex.—Bridges—Union Bridge & Construction Co., Kansas City, Mo., for the construction of the two bridges on the Lometa-Brady-San Saba extension of the Santa Fe, one across the San Saba River and the other across the Colorado River.

ROADS AND STREETS.

Mobile, Ala.—Sidewalks—Kooiman & Co., at $0.68, for the construction of sidewalks in this city.

Phoenix, Ariz.—Road—Johnson & Shea, Riverside, Cal., for the construction of the first section of the Prescott-Phoenix territorial road, from Prescott to the Mount Union summit.

Tucson, Ariz.—Paving—Concrete Construction Co., at $9,000, for the construction of a macadamized roadway on North Stone Ave.

Sacramento, Cal.—Road—George Williams, at $1,395, for the construction of a new wagon road on Saratoga hill in District No. 2.

Stockton, Cal.—Paving.—Cy Moreing & Son, city, for paving roads in San Joaquin County.

Mishawaka, Ind.—Paving.—Western Construction Co., Lafayette, Ind., at $9,419, for paving South Mill St., with bitulithic.

Peoria, Ill.—Paving—Jansen & Zoeller, Pekin, at $1.69 per yd., for paving Washington St., from Fourth St. to Court St. The work includes 15,000 sq. yds. of pavement, 6,000 ft. of cement curb and 600 ft. of protection curb. The work will cost about $27,000.

Webster City, Ia.—Paving—Sullivan & Zitterell, city, for the construction of pavement in this city at the following prices; Paving alley, $2.08 per sq. yd.; paving Second St., $2.02 per sq. yd.; First, Division and Des Moines Sts., $1.96½ per sq. yd.; curbing and guttering, $0.67½ per ft.

Centerville, Ia.—Brick Paving. — Bids were opened May 13 by this city, Hall & Addams, Engineers, for paving, the contract being let to McGuire & Stanton, Leavenworth, Kans., at $64,711. The itemized bids received on the work were as follows: (1) standing for 25,930 sq. yds. brick paving on 5-in. base, 1½-in. cushion, with cement filler, the bid including grading; (2) for 20,910 lin. ft. combined curb and gutter, 24-in. gutter, 1-in. wearing coat, and (3) for 4,000 cu. yds. extra grading:

	(1)	(2)	(3)
M. Ford, Cedar Rapids, Ia....	$2.075	$0.55	$0.35
Cedar Rapids (Ia.) Con. Ct..	2.095	.57	.36
North. Const. Co., Cdr. Rapids.	2.14	.68	.36
McGuire & Stanton, Leavenworth, Kans.	2.03	.52	.30

Bovey, Mich.—Road—A. A. Mitchell, at $3,500, for widening the road between this city and Grand Rapids, from 12 to 30 ft.

Marquette, Mich.—Road—County road commissioners awarded the following road contracts: James Oxnam, Ironwood, at $9,306, for constructing the first four miles of the Ironwood and Watersmeet road. This section is between Ironwood and Bessemer; John Hanousek, Ramsey, at $4,922, for the next two miles, Bessemer township; Henry Poykonen, at $1,700, for the next mile; Andrew Katane, at $1,600, for the last mile.

Albert Lea, Minn.—Curb & Drains.—Albert Lea Construction Co., at $4,620, for constructing 9,800 ft. of concrete curb and drains. Bids were opened May 18.

Sedalia, Mo.—Road—Hyatt & Johnson, at $15,000, for the construction of six stretches of rock and gravel roads, one-half mile extensions of road previously constructed, as follows: Georgetown, Ben Harned, Smithton, Abel, Beaman and Dresden.

St. Joseph, Mo.—Paving—Phoenix Brick & Construction Co., for paving Fourth, Albermarle to Isabelle, with brick, at the following prices: New curbing, $0.40; old curb reset, $0.16; old curb recut and reset, $0.20; artificial stone sidewalk, per sq. ft., $0.12½; new brick walk, $0.80; old brick walk relaid, $0.30; vitrified brick paving, $1.29¾ per sq. yd.

Havre, Mont.—Walks. — To Meracle Construction Co., Minneapolis, Minn., at $8,500, for constructing about 37,900 sq. ft. of cement walks.

Port Jervis, N. Y.—Paving.—A. Demarest, Seward, N. J., at $23,706, for grading and macadamizing a public road in Seward County.

Syracuse, N. Y. — Paving — Warner-Quinlan Asphalt Co., at $5,797, for paving Furman St. with asphalt; F. J. Baker, at $6,680, for the paving of Dewitt St. from James St. to Highland Ave., with stone curb; and at $6,151, for paving Oxford St. from Cortland Ave., to Onondaga circle.

Rochester, N. Y.—Paving & Water Mains—Following contracts have been awarded by the board of contracts: Ripton & Murphy, at $3,332, for trenching and laying water pipe in group 238; Whitmore, Rauber & Vicinus, at $2,934, for paving and sewering Tallinger alley; at $24,545, for paving Mt. Hope Ave. with asphalt and Medina block; at $9,679, for paving Oakland St. with brick; and at $18,567, for paving Federal St. with brick.

Cleveland, O.—Paving.—Enterprise Paving & Construction Co., 8444 Broadway St., Cleveland, O., for the construction of block stone pavement in this city. Bids were opened May 14.

Cleveland, O.—Paving.—Standard Paving Co., city, at $10,778, for paving on Cornell road at Nickel Plate Railroad crossing.

Steubenville, O.—Paving—J. O. Bates for the construction of cement walk and paving on Park St. and Grandview Ave., in Pleasant Heights.

Holdenville, Okla.—Paving—Shelby & Downard, Ardmore, at $1.87 per sq. yd., for the construction of the first 20 blocks of paving in this city. The pavement will be of rock asphalt and the work will commence within 60 days.

Scranton, Pa.—Grading & Sewers—P. F. McGowan, Avoca, at $21,000, for the grading of streets, laying of sewers and flag walks on the plat of the Naw Aug Park Land Co.

Connellsville, Pa.—Paving — James Nixon, Clairton, for paving with brick the road leading from the county home to Jenning's run in South Union township.

Ellensburg, Wash.—Paving—D. A. Williams, Tacoma, at $150,000, for the paving of the entire business district of the city, approximately 13 blocks, with asphalt pavement.

Olympia, Wash. — Roads — State Highway Board has awarded the following contracts for constructing roads: J. C. Charles, Keller, at $15,839, for state aid road No. 4, Lincoln county; Warren Shorts, Seattle, at $7,415, state aid road No. 15, Cowlitz county; W. F. Guernsey & Co., Seattle, at $87,033, state aid road No. 69, King county; P. E. McHugh, Tacoma, at $51,181, state aid road No. 70, Pierce county; Sloan Bros., Seattle, at $11,123, state road No. 7, King county.

Janesville, Wis.—Paving—George W. Graham of Gund-Graham Co., at $26,000, for the construction of brick paving in this city.

Winnipeg, Man.—Paving.—J. W. Astley, engineer of construction for the city, for the construction of asphalt pavement in this city.

SEWERS AND WATER SUPPLY.

Decatur, Ala.—Sewer—McPoland & O'Gara, for the construction of the laterals to the new addition to the sewer system in New Decatur.

Cedar Falls, Ia.—Sewers.—W. D. Yeager, Cedar Rapids, Ia., at $2,891, for the construction of storm sewers in this city; Schorle & Kenety, Dubuque, Ia., at $4,427, for the construction of sanitary sewers. Bids were opened May 23.

Springfield, Ill.—Sewers—Henry Nelch & Son, for the construction of sewers as follows: On 17th St., from Cook St. to Laurel St.; Edwards St., from 18th St. to Wheeler Ave.; Edwards St., from 11th St. to 14th St., at $1.25, $0.80 and $1.10 per lin. ft., respectively.

Brazil, Ind.—Water Mains.—U. S. Cast Iron Pipe & Foundry Co., 217 La Salle St., Chicago, at $25.95 per ton, for furnishing 3,000 ft. of 4-in. cast iron water mains. Bids were opened May 17.

Manahattan, Kan.—Sewer System—W. W. Cook & Son, Junction City, for the construction of a sewer system in this city.

Boston, Mass.—Remodeling Water System.—J. A. Costello, city, at $2,345, for remodeling water system at Fort Strong, Mass. Bids were opened Apr. 23.

Baltimore, Md.—Sewer.—United Engineering & Construction Co., city at $83,836, for the construction of sanitary sewer, Jones, Falls interceptor, contract No. 50, Section No. 2. Bids were opened May 4.

Baltimore, Md.—Sewer—United Engineering & Construction Co., city, at $83,836, for building the Jones' Falls sanitary interceptor for the sewerage commission.

Hutchinson, Minn.—Sewer & Water Main.—L. W. Schruth, Fargo, N. Dak., at $4,106, for

The Question of Contract or Day Labor As Seen by the "Pacific Outlook."

Two weeks ago we quoted from the *Pacific Outlook*, a journal for good government published in Los Angeles, Cal., a defense of day labor work by the assistant chief engineer of the Los Angeles aqueduct. In this issue we publish costs compiled from various sources of portions of the aqueduct work and also reprint an editorial on the question between day labor work and contract work which we find in a later issue of the journal named. This editorial shows so very incomplete a conception of the question at issue and of the breadth of the study that has been given to it that it deserves comment. The question of the relative economy of day labor and contract work may, we think, claim interest aside from the "principles of democracy and good government" involved. The construction and maintenance of sewers, water-works, streets and buildings account for the great bulk of the money spent by every city in its public services to the people, and we doubt if it will be regarded by many as a "dull subject" or a "commonplace detail" to learn whether this money is expended in the most economical and efficient manner. We suspect that the apology of our contemporary for devoting the space that it has to the subject is rather gratuitous.

The editor of the *Pacific Outlook* mistakes the position of the "firm of Boston engineers" and of "engineering and contracting publications" in the study of the economics of day labor and contract construction. So far as the publications named go, the truth is that "most" of them have very persistently refrained from taking any "attitude" or have taken one in favor of day labor work. Indeed we know of no documents of similar importance on the economics of construction work which have received less space in "engineering and contracting publications" generally, than have the reports of Metcalf & Eddy on Boston's sewer and water-works construction finances. It should be noted carefully just what was the work done by these gentlemen who are the "firm of Boston engineers" to which our contemporary refers.

Messrs. Metcalf & Eddy were employed as engineers to investigate the financial management of the construction and maintenance work of the water-works and sewer departments of the city of Boston. Other experts were similarly employed to investigate the work of other city departments—this is an item that should not be overlooked. These engineers performed their tasks with notable thoroughness and reported the results in detail. It is these detailed reports of their findings with which students of the question between day labor and contract work have to deal, and not the opinions of the investigating engineers, as then or afterwards given personal expression. It matters much of course that these engineers voiced their opinions after finding the facts, but it matters much more that the facts were found. The position is not that a "firm of Boston engineers" is "throwing the weight of its influence in favor of contract work," but that the facts disclosed by them and by other engineers working independently are doing so. Let us keep to this point.

Our contemporary properly submits that "the experience of nine cities out of ten shows that work can be done more cheaply under contract than by direct day labor." We think this estimate is over liberal to day labor work but it may stand as put. Why is day labor not as cheap as contract work? The editor of the *Pacific Outlook* finds that the advocates of contract work "explain" it by the claim that "city officials and employes are largely incompetent or dishonest or both." We are at loss to know where our contemporary got this "explanation." None but a very superficial study of the reports of the engineers who investigated conditions in Boston would give it, and certainly the editorials which have been published in ENGINEERING-CONTRACTING have been more poorly put than we had realized if they have seemed to give it. Incompetency and dishonesty of city officials have had a part in the extravagant cost of day labor work in many instances, but were these the only causes the case against it would be far weaker even than our contemporary asserts. The fundamental reason for the high cost of day labor work goes deeper and spreads far wider; the conditions governing day labor work violate the fundamental law of economic production, which is that the reward shall increase with increased performance.

It is important that the arguments of those who advocate contract work should be clear to and be made clear by journals like our contemporary, and they will bear repeating. The contract system of doing public work is advantageous for the following reasons:

(1) The contractor is paid for his services by his profits. Let it be noted here, because it is important, that these profits are a recompense for skilled service and nothing else. It is a common error to assume that the contractor's profits are something for which the city gets nothing, a gift of a sort to the contractor. Dispense with the contractor and the city must substitute some one in his place to render the service of manager. This substitution can never be complete. The contractor is a manager appointed by no official, elected by no party or persons, selected by no civil service examination. He has become a manager by virtue of the law of the survival of the fittest in the competition and strife of business. He is a skilled manager because skill is the price that competition demands for allowing him to continue in the business of contracting. He is an efficient manager because his pay (profits) is determined by his efficiency; his salary does not go on regardless of cost, indeed unless he watches closely the cost he may get no salary.

(2) The contractor is a master. He is free to pay his superintendents according to his judgment of their worth and his workmen according to their output. The city's manager, appointed, elected or selected by examination, is not a master—at most he is only a proxy for a master. And who is this master? He is a thousand, a million, or perhaps, if a Panama canal is being built, four score million—never seen, never felt, never heard, never a living personality on the job. Granting such a manager all honesty, why should he sit up nights devising ways of increasing output and reducing costs? Why should he go about by day jumping on his lieutenants and workers to sting them into action? Will he get a share in the savings effected, a partnership in the business, an increase in salary? No, he will simply lose sleep and make enemies of his subordinates. We are not forgetful of the impulse to make a good record, we will even grant this impulse and not the hope of financial gain to be all important with the chief himself, but his hands are tied by the indifference to it of the vast majority of the men beneath him.

There are other reasons for the superior economy of contract work. A contractor is more free to try out and to invent labor saving devices; he is not restricted to working his plant in one locality nor on one class of work; he can usually buy machines and materials more cheaply, and he can do his work with less expense for overhead charges. But these are all minor items compared with the two first mentioned. It is not plant, it is not organization, it is not personal honesty that determines costs. They are factors in favor of low costs, but factors which count for little unless directed by a mind keenly bent on saving every penny and free to bring every resource to bear to make that saving possible.

The editor of the *Pacific Outlook* mentions with pride the cities of Galveston and Des Moines with their commission forms of city government. He looks with no more hopeful eye on this form of government than does ENGINEERING-CONTRACTING. Were it the fact, as our contemporary assumes, that the extravagant cost of day labor construction is "because city officials and employes are largely incompetent or dishonest or both," then commission government might give us a solution of our problem. But this is not the fundamental cause of high day labor costs, it is merely a factor which is often perhaps, but not always operative. An honest and efficient commission government will palliate in a measure the conditions that lead to extravagance in day labor work, but it will not strike to the root of the reason that makes contract work more economical. This is not a reflection on commission government or on the men who head these commissions. It is merely a recognition of a controlling influence in human nature. There are few men of higher honor or greater faithfulness to duty than the teachers of our engineering schools, but this is what one of the best of them and a man of wide practical experience has to say of the cause of inefficiency in engineering school training:

With reference to administration, the fun-

Copyright 1910, by the Myron C. Clark Publishing Co. All Rights of Republication Reserved.

damental limitation to efficiency seems to me to lie in a fact which has already been referred to, namely, that the administrators—that is to say, the trustees—have no financial interest at stake. This is the fundamental difference between the administration of a college and the administration of a business concern. Where men have no financial interest they cannot be expected to fully realize the responsibility, nor will they be apt to energetically take the necessary steps to insure efficiency.

For this reason, among others, I do not believe that education ever can be as efficient as business. I am not unmindful of the fact, of course, that there are many men who, if they accept positions on a board of college trustees, will take the same pains and feel the same responsibility as if they were trustees of a business corporation in which their own money as well as the funds of widows and orphans were invested; but this is somewhat contrary to human nature and must always be the exception. Money, or rather the love of it, may or may not be the root of all evil, but it certainly comes very near being the source of all efficiency.*

Instead of opening the door to the possibility of efficient day labor construction commission government of the kind which the *Pacific Outlook* mentions as existing at Galveston and Des Moines opens a certain way to developing the highest economies of contract construction. Practically the only well founded criticisms of doing city work by contract are (1) collusion between contractor and city official to defraud, (2) inefficiency and favoritism because of political influences. Eradicate these so that bids can be made on plain and fair specifications and with free and open knowledge of conditions and complete assurance of freedom from graft and contract costs will show an economy which can be reached in no other way.

In concluding we may mention that the closing paragraph of the *Pacific Monthly* editorial which we reprint is about as close an approach to tenuity of argument as a comet's tail is to tenuity of matter. How in heaven's name is a city "dodging responsibility" by having its sewers built or its streets paved by contract? Why is it a "confession" that "means paralysis of all effort toward improvement" to call upon expert constructors to build bridges and pumping engines? As well might we say to a merchant that it "means paralysis of all effort toward improvement" for him to contract with his shoe maker instead of setting up a cobbler's bench in his basement. If the call for socialism in city government has no better arguments than these it is in a mighty bad way.

Contract or Day Labor.

Pacific Outlook has given space lately to discussion of the comparative merits of contract and direct day labor as applied to city work. This may seem to some of our readers a dull subject, dealing with a commonplace detail of administration, but in reality it involves some important principles of democracy and good government, and for that reason is well worth space.

A firm of Boston engineers which has made a special study of economic municipal administration and whose reports on such topics have attracted national attention, is throwing the weight of its influence in favor of contract work and most of the technical engineering and contracting publications take the same attitude. These people have a simple and convincing argument—viz.: that the experience of nine cities out of ten shows that work can be done more cheaply under contract than by direct day labor. Case after case is cited of cities that try one method or the other, and almost invariably the figures prove that economy lies on the side of the contractor.

Yet these advocates of the contractor system give their whole case away when they

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Standard Specifications for Reinforcing Bars for Concrete.

The specifications for structural steel of the Association of American Steel Manufacturers are well known to bridge and structural engineers as safe and reliable. When not otherwise specified all steel shapes for structural work are manufactured according to these specifications and that means of course that they control a great bulk of all structural steel. To supplement these structural steel standard specifications the association has just adopted by letter ballot a standard specification for reinforcing rods for concrete which we reprint as follows:

Manufacture.—1. Steel may be made by either the open hearth or Bessemer process. Bars shall be rolled from billets.

Chemical and Physical Properties.—2. The chemical and physical properties shall conform to the following limits:

Properties considered.	Structural steel grade. Plain bars.	Structural steel grade. Deformed bars.	High grade. Plain bars.	High grade. Deformed bars.	Cold-twisted bars.
Phosphorus, maximum.					
Bessemer	.10	.10	.10	.10	.10
Open-hearth	.06	.06	.06	.06	.06
Ultimate tensile strength, lbs. per sq. in.	55/70,000	55/70,000	80,000 min.	80,000 min.	R'c'd'd only
Yield point, minimum, lbs. per sq. in.	33,000	33,000	50,000	50,000	55,000
Elongation, per cent in 8 ins., minimum	1,400,000	1,250,000	1,200,000	1,000,000	5%
	T. S.	T. S.	T. S.	T. S.	
Cold bend without fracture:					
Bars under ¾-in. in diameter or thickness	180°d.= 1t.	180°d.= 1t.	180°d.= 3t.	180°d.= 4t.	180°d. 2t
Bars ¾-in. in diameter or thickness and over	180°d.= 1t	180°d.= 2t.	90°d.= 3t.	90°d.= 4t.	180°d.= 3t

The hard grade will be used only when specified.

Chemical Determinations.—3. In order to determine if the material conforms to the chemical limitations prescribed in paragraph 2 herein, analysis shall be made by the manufacturer from a test ingot taken at the time of the pouring of each melt or blow of steel, and a correct copy of such analysis shall be furnished to the engineer or his inspector.

Yield Point.—4. For the purposes of these specifications, the yield point shall be determined by careful observation of the drop of the beam of the testing machine, or by other equally accurate method.

Form of Specimens.—5. (a) Tensile and bending test specimens may be cut from the bars as rolled, but tensile and bending test specimens of deformed bars may be planed or turned for a length of at least 9 ins. if deemed necessary by the manufacturer in order to obtain uniform cross section.

(b) Tensile and bending test specimens of cold-twisted bars shall be cut from the bars after twisting, and shall be tested in full size without further treatment, unless otherwise specified as in (c), in which case the conditions therein stipulated shall govern.

(c) If it is desired that the testing and acceptance for cold-twisted bars be made upon the hot rolled bars before being twisted, the hot rolled bars shall meet the requirements of the structural steel grades for plain bars shown in this specification.

Number of Tests.—6. At least one tensile and one bending test shall be made from each melt of open heart steel rolled, and from each blow or lot of ten tons of Bessemer steel rolled. In case bars differing ⅝ in. and more in diameter or thickness are rolled from one melt or blow, a test shall be made from the thickest and thinnest material rolled. Should either of these test specimens develop flaws or should the tensile test specimen break outside of the middle third of its gaged length, it may be discarded and another test specimen substituted therefor. In case a tensile test specimen does not meet the specifications, an additional test may be made.

(d) The bending test may be made by pressure or by light blows.

Modifications in Elongation for Thin and Thick Material.—7. For bars less than 7/16 in. and more than ¾ in. nominal diameter or thickness, the following modifications shall be made in the requirements for elongation:

(e) For each increase of ⅛ in. in diameter or thickness above ¾ in. a deduction of 1 shall be made from the specified of elongation.

(f) For each decrease of 1/16 in. in diameter or thickness below 7/16 in. a deduction of 1 shall be made from the specified percentage of elongation.

(g) The above modifications in elongation shall not apply to cold-twisted bars.

Number of Twists.—8. Cold-twisted bars shall be twisted cold with one complete twist in a length equal to not more than 12 times the thickness of the bar.

Finish.—9. Material must be free from injurious seams, flaws or cracks, and have a workmanlike finish.

Variation in Weight.—10. Bars for reinforcement are subject to rejection if the actual weight of any lot varies more than 5 per cent over or under the theoretical weight of that lot.

Requirements of Successful Granolithic Floor Construction with Specifications for Mill Floors.*

The experience of this company in its own construction work has shown it that the highest degree of serviceableness in a granolithic surface can be obtained only by following very carefully certain principles of construction and certain methods of manipulation, and this company has believed, and in the light of recently accumulated evidence, still believes, that the properly constructed granolithic surface is cheaper in first cost and will give more wear for general factory and machine shop purposes than the wood top floor. In making this statement we have no intention of asserting or seeming to assert that every granolithic floor, however constructed, is necessarily better than any wood top floor. That would be absurd on the face of it.

There are certain situations where in spite of its higher first cost the wood top floor is propably better than any granolithic surface for the owner to put in, simply because his case may require certain qualities which the wood top can provide, which no masonry surface can give, and which he must have, even at a higher first cost. It must also be clear

*Extract from an article furnished by the Aberthaw Construction Co., Boston, Mass.

that a granolithic surface so faultily laid that it loads the work room with dust created by the movement of the workers' feet, that chips and cracks freely under blows from material moved about on it, or that peels off from the concrete floor slab underneath, is not a good investment for the owner, even though its first cost was less than that of wood top. The virtues of a wood floor are inherent in naturally formed material whose fitness is apparent at a glance. Saw up the tree, season the sawed and planed strips, let any carpenter make them into a floor, and you have a wearing surface of certain high recognized value. With the granolithic surface, in contrast, it is necessary to select cement and aggregate for certain qualities not evident in the appearance of these materials, to determine proportions, to put the materials on the right kind of surface at the right time, to manipulate them in just the right manner, and to protect the green surface for a certain number of days while it is setting. The mere statement of the procedure necessary with the granolithic finish is enough to show that the average granolithic floor will be more or less unsatisfactory because the average concrete worker is inclined to haste, and is often ill informed as to the procedure necessary for getting a good surface. In other words, the success or failure of the granolithic surface in point of durability comes down to the question of workmanship.

Cost.—Certain general principles which apply to the matter of choosing between the granolithic and wood surface may well be stated as a preface to a more detailed discussion. A 1-in. troweled surface of cement finish can be put in place for about the cost of good quality maple top flooring delivered on cars at the site of the work. The difference in cost between the top floor of cement and that of wood will be the cost of the under floor, the screeds, and cinder or other fill between the screeds, plus the cost of the extra strength in columns and girders required to carry the load of the combination wood floor, which is much heavier than the 1-in. granolithic finish. On the ground of first cost therefore the advantage is entirely with the cement floor.

The difference in cost is not merely a question of the comparative cost of laying an inch of granolithic surface and laying the maple top with its under floor and screeds. The granolithic finish ought when possible to be laid upon the floor slab while the latter is green. This is the only way, in the first place, to secure a perfect bonding between the surface finish and the slab. In the next place this uniting of the cement finish with the cement slab makes the finish so completely an integral part of the floor slab that it bears part of the compression strains in the floor structure, and by this fact permits of the use of a much lighter slab than is required for a wood top. The importance of this fact in self supported floors is obvious.

The wood floor, on the other hand, is absolutely dead load so far as the concrete floor slab underneath it is concerned. The weight of screeds, of cinder or concrete fill between the screeds and not forming structurally a part of the floor slab, and of the 2 or 3 ins. of plank in the under floor, plus the ⅞-in. maple overlay, reaches a much higher total figure than might be supposed by any one who has not gone into the engineering side of the matter. Wherever therefore a wood finish is used on top of a cement floor, a considerable increase in the strength of columns, girders, and floor slabs is needed for the dead load of the wood floor in excess of the strength that would be required for the granolithic finish. It should be clear therefore that the wood top floor in the concrete mill or factory means a higher cost per square foot or cubic foot for the whole structure.

Quickness of Construction.—If a wood top floor is used, supported by a concrete slab, time must be given to dry the slab out thoroughly before the kiln dried stock is put in place, else the floor will swell, curl, and make trouble. The whole building must be well dried out in order to get a satisfactory result, and even by forcing the building with heat and by carefully airing it oftentimes a wood floor comes out in disappointing shape. With the full knowledge of the danger, owners have frequently found it necessary to lay wood floors much before the under concrete has dried out, with the knowledge that they would always be disappointed in the appearance of the floor. If, when the slab is wet, water-proof paper is laid between the under flooring and the top flooring it is almost certain to cause dry rot in the under flooring and the screeds, and to make trouble later on.

Cement finish can be put on at the same time as the under concrete, or can be put on at any time during the construction of the building, but if the under concrete is wet a better surface will be obtained than if it has been thoroughly dried out. Accordingly, so far as speed goes, the advantage is with the cement top floor. These two features interest the builder of any structure at the time of erection fully as much as they interest the owner, and are strong enough to prejudice the man responsible for the erection of any building very much in their favor. The proof of the selection comes on another man who has often not been responsible for the selection of the material, and due weight must be given to his opinion.

Principles of Construction.—Aside from the desirability of laying the granolithic surface on the wet floor slab, which has already been mentioned, there is also required for the satisfactory cement surface proper choice of aggregate, proper proportioning, and proper manipulation. To give good service the aggregate must be a hard, tough stone. Many stones that are hard are so brittle that they crack under a slight blow, and will come out from the cement leaving a pocket, which becomes a center for further breaking down. Sand is objectionable because brittle. Proper manipulation of the cement, aggregate, and water, which go to make up the granolithic finish, is difficult to secure, and it has been one of the problems of the Aberthaw Company's own work to get its men trained to the efficient handling of this material. This company has found that the best result is obtained with a finishing mixture that is rather dry—wet enough to make a good bond with the green floor slab underneath, but dry enough so that prolonged troweling is required to secure a film of water on the surface. The trowel, in its contact with the aggregate, should arrange the pieces of stone so that they lie with flat faces uppermost, thus providing a good wearing surface. It is difficult to get the ordinary concrete workman to trowel a cement finish with the care that is necessary. Good wearing quality requires that the aggregate in the finish shall be worked into an absolutely perfect bond with the cement, and angular aggregates set in a thin layer of cement form a material that the average workman does not enjoy working over. When the granolithic finish is completed the aggregate should show on the surface in innumerable points or flat surfaces with the solid cement between. These points and surfaces of the aggregate, if they are of properly hard, tough material, will take the greater part of the heavy wear on the surface, protecting the mortar to a large degree from the effects of the truck wheels, which are the cause of most serious wear.

It should be evident to any one who looks at the matter broadly that no floor material is everlasting or combines all the qualities that manufacturers of greatly different requirements ask of a floor for their own particular purposes. It should be clear, further, that no floor made of an artificial material can possibly be equal in wear resisting qualities to a floor laid with slabs of syenite, for instance, which is a material for the making of which nature could command laboratory facilities far beyond any at the command of man.

It must be evident that the answer to the question, What is the best floor? must be determined very largely by the circumstances of the particular case. No one surface is equally good for all possible uses, and the conditions demanded for the proper construction of a given type of floor may sometimes make it impracticable to put in that type when it is really desired. Granolithic surface, wood top, and some of the other surfaces have each their excellences and defects, and a choice must be made by weighing all the conditions in each instance.

This discussion has necessarily been concerned mainly with granolithic and wood floors. We conclude it by giving specifications for the two types, representing the practice of the Aberthaw Construction Co. in concrete and that of Lockwood, Greene & Co. and F. W. Dean in wood floors.

SPECIFICATION FOR GRANOLITHIC FINISH ON CONCRETE BASE, ACCORDING TO THE PRACTICE OF THE ABERTHAW CONSTRUCTION COMPANY.

These specifications contemplate work in localities where tough stone is available; local conditions will govern the selection of other materials.

If the surface is to be laid upon an unset concrete base, the specifications should require that it be laid as soon after the base is in as may be, and if possible before the under concrete has set, so that the base and the finish shall bond together; otherwise the specification will apply.

Mixture of the top finish should be in the proportion of 1 part Portland cement; 1 part stone from 1-2 in. to the smallest size, excluding dust; and 1 part sharp sand. (No grains passing a 50 screen, the majority of sizes which will pass between a 20 and a 30 screen.) This shall be mixed to a stiff paste, just wet enough so that in troweling the water will barely work to the surface.

Base. If old concrete, the surface shall be roughened either by sand blast, acid treatment, or other equally satisfactory method of cleaning the stones so that the mortar shall adhere to them. The under concrete shall be thoroughly wet, and shall be kept wet long enough to absorb all the water it will take up readily, thus insuring a base so wet that it will not draw water from the finish when the latter is applied. Before scrubbing the base with grout, the excess of water shall be removed so that the finish shall not become too wet.

Finish. The surface of the base shall first be scrubbed with a thin grout of pure cement rubbed in with a broom. On top of this, before the thin coat has set, a thin coat of finish, mixed as above specified, shall be troweled hard, using as much pressure as possible, and rubbing the finish hard down on the roughened base so that it shall take firm bond. After this, the finish shall be applied to the desired thickness, screeded and floated to a true surface. Between the time of the initial and final set, it shall be finished by skilled workmen with steel trowels and worked to final surface. Under no condition shall dryer be used, nor shall water be added to make the material work easily.

It is to be understood that with the mixture specified, the surface will show slightly pebbled because of the small pieces of stone. It will not be possible to get so slick a job as can be obtained by using sand alone, and this is not expected.

If the finishing is done in hot weather, the finish shall be protected from sun and wind in order to prevent too rapid setting.

SPECIFICATIONS FOR COMPOSITE FLOORS WITH TAR CONCRETE BASE SHOWING PRACTICE OF LOCKWOOD, GREENE & CO., ARCHITECTS AND ENGINEERS, BOSTON.

Tar Concrete Base.—Lay a tar concrete base to support plank sub-floor. The surface of the ground to receive concrete to be well rolled to a true level before laying the concrete. Where filling is required, it must be tamped and puddled thoroughly. A layer 4½ ins. deep of concrete shall be put down, composed and laid as follows:

First—A layer 3 ins. thick of coarse screened gravel, thoroughly mixed with tar and rolled down to a hard, level surface.

Second—A layer of pea gravel screened and well mixed with coal tar, to fill up spaces between and to be again well rolled, making both layers 3½ ins. thick, with a hard surface.

On this bed spread top dressing, consisting of sand heated and thoroughly mixed with the coal tar and pitch (one part pitch and three parts tar). To be mixed together until the sand is completely covered, making a homogeneous mass. Spread the top dressing 1½ ins. thick

over the whole surface, using a 1½-in. plank as a gauge and leveling off even with top of same. This to be rolled to a level surface, 1 in. thick, ready for receiving floor plank, which is to be bedded on the top dressing before hardening.

Plank Sub-Floor.—The floor plank where supported on concrete, to be of sound hemlock, 3 ins. thick, planed on one side to an even thickness and edges jointed, so that each plank is the same width its entire length. To be laid level on concrete, following closely after top dressing of concrete is laid, before hardening that the plank may be bedded on it. To run across the building, butted and toe-nailed with 4-in. wire nails. This plank is not to exceed three different widths in the entire lot and not over 10 ins. wide.

Maple Top Flooring.—To be of maple, all of clear stock, 1 in. thick before planing, air-dried and kiln-dried and not over 4 ins. wide. All flooring planed on one side to an even thickness and edges jointed, making each board the same width for the whole length and the under side double channeled or plowed. All ends to be matched.

Laying.—Separate the several widths, laying each course lengthwise of the building, with one width of boards. Break joints at random for every course of boards and crowd together and hold by temporary nailing. To run at right angles with floor plank and each board neatly fitted at the ends.

Note: This flooring is not to be taken into the building or laid until the walls and plank are thoroughly dried out.

Nailing.—To be finally nailed with 10d. or 3-in. wire floor nails. Nailed in diagonal rows, 14 ins. apart across the boards, with two nailings in each row in every board. All nails set and all standing joints smoothed down to make a smooth, level floor.

SPECIFICATIONS FOR LOCKING A WOOD-TOP FLOOR TO A CONCRETE FLOOR ACCORDING TO PRACTICE OF F. W. DEAN, MILL ENGINEER AND ARCHITECT, BOSTON.

Two-inch by three-inch beveled edge planed sleepers shall be built into the concrete in the following manner:

The concrete floor shall be brought up to within two inches of its ultimate thickness. The sleepers will then be accurately placed in parallel lines 18 ins. apart and running at right angles to the girders. The concrete should then be poured between the sleepers, using them as screeds in leveling the top surface. Care must be taken to see that the sleepers are thoroughly imbedded in the concrete without any voids. On top of the sleepers and at right angles to them shall be spiked square edged plank surfaced on one side and both edges, 3 ins. thick and 7 to 10 ins. wide. This plank shall be tightly drawn up and nailed with two 4-in. nails at each bearing. The ends of the planks shall meet half way between the sleepers.

Finished flooring to be of clear stock maple, ⅞ in. finished thickness, thoroughly air and kiln-dried and not over four inches wide. The flooring to be planed to an even thickness, the edges and ends squared, and the underside double channeled or plowed. Finished floor to be laid at right angles to the under flooring and each board neatly fitted at the ends, breaking joints at random. Floor to be finally nailed with eight penny wire floor nails in diagonal rows 16 ins. apart across the boards with two nailings in each row in every board. The floor to be finished off perfectly smooth on completion.

Officials of the Chicago & Northwestern Ry. have under consideration the construction of a cutoff from Crofton to Niobrara, Neb. The present route on the Northwestern is southwest to Norfolk, Neb., from Sioux City, then northwest to Niobrara, and on west through Bonesteel. The proposed cutoff would establish almost a straight stretch of track from Sioux City west to Niobrara, barring a small V line from Sioux City southwest to the Crofton branch. Some of the petitioners are asking that the cutoff be built from Wynot, Neb., west to Niobrara, which route would be yet a few miles shorter than that by way of Crofton, but it is thought that if the line is established at all it will be through Crofton and not Wynot.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

An Economical Substitute for a Timber Trestle in Making a High Embankment.*

Usually two methods are employed in making embankments where locomotives and dump cars, either narrow or standard gage, are used. The first method is to lay the track on the ground, and, by dumping alternately to right and left, jack up the track until the required height is reached. This method is most economically employed where the ratio of length of embankment to height is 25, or more, to 1. The second method is to build a trestle and make the fill by dumping from it. Building trestles is more or less expensive, and, if the material to compose the embankment contains a considerable proportion of large rock or boulders, there is always the danger of carrying away a bent or otherwise seriously injuring the structure.

Several years ago, the writer was one of the engineers on a piece of heavy railroad work in the South where the embankments were high and were made by trestling. One of the embankments to be made contained about 115,000 cu. yds., reached a maximum height of 57 ft., and was slightly over 800 ft. long, from grade point to grade point. To build a trestle would have cost between $6,000 and $8,000, and, as the material to make the fill was mostly rock, the chances were very great that a part of the structure would be carried away before the completion of the work. To avoid the necessity of constructing a trestle, the following scheme was adopted:

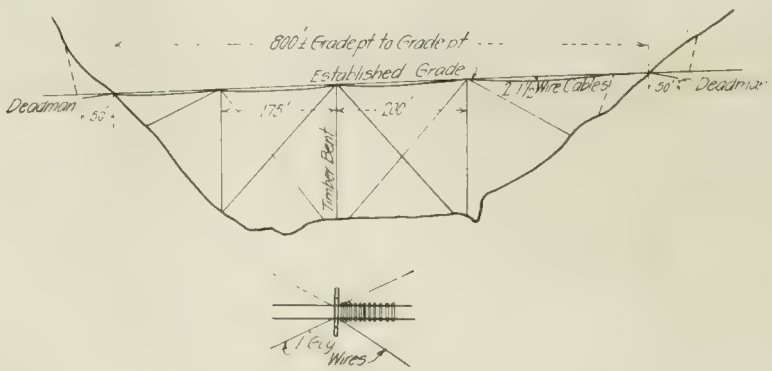

Fig. 1.—Diagram Elevation of Wire Rope Trestle for Making Large Fill.

The cuts at both ends of the embankment were opened up in the usual manner with carts for about 60 ft., as indicated by the dotted lines in Fig. 1. At points, approximately 50 ft. from each grade point, deadmen were sunk, and two 1½-in. wire cables, spaced 3 ft. 6 ins., were stretched from one to the other and hauled as taut as possible. At points about equally dividing the fill, three timber bents were erected, as shown in Fig. 1. These bents were made from timber cut on the right-of-way. Their construction is showni n Fig. 2. Caps were about 8x8 ins. x 6 ft. and sills about 10x10 ins. As this timber was cut on the ground, the dimensions varied slightly.

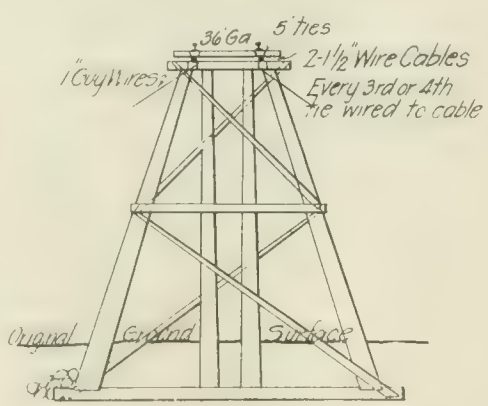

Fig. 2.—Details of Timber Bent for Wire Rope Trestle.

In erecting, the tops of the caps were brought to the established grade line, and the sills were sunk in a trench 3 or 4 ft. deep, which was backfilled with rock or earth. This steadied the bents and prevented their kicking out at the foot. From the caps, 1-in. guy wires were run out at angles of about 45°, in order to clear the dumping of material as far as possible, and fastened to deadmen. The main cables were then fastened to the caps by wire lashings and the ties placed on them, every third or fourth tie being lashed to the cables. The rail was then laid on the ties, brought to the established grade line, and the were laid far enough ahead to accommodate the length of train used.

The method of operation was as follows: A train of loaded cars was backed onto the approach fill, and, at the point where the cables left the fill, were dumped, the first car on one side, the second on the other side, alternate cars on alternate sides, until the entire train was unloaded. The train was then run back on the approach fill and the cars righted. Dumping the cars on alternate sides balanced the weight on the cables, prevented the overturning of the train and made the fill about equal on both sides of the track. All cars were dumped before their loaded weight came on the cables, only empty cars being supported thereon. Little or no shoveling of material was required, most of it sliding to the bottom of the fill, and what little remained was generally used in jacking up the track. As the bents were approached, more or less care was exercised to prevent their being injured, but no more so than on any other trestle.

The work was carried forward in this manner until the ravine had been spanned, after which it was widened out in the usual way.

In building the trestle it was assumed that the deflection of the cables at the center of a bay would be about 5 per cent of the span, but, by jacking up the track as the embankment was made, the deflection was reduced to about 3 per cent. When dumping at the center of a 200-ft. span this gave about a 6 per

*A paper by J. L. Ingle, Jr., presented to the American Society of Engineering Contractors.

cent grade for a dinkey engine to start an empty train on, and was not prohibitive.

The plan described left very little material in the dump, saved the main cables, guys, and caps, and was much more quickly and cheaply carried out than would have been the erection of an all timber trestle. The writer left for other work before the completion of this fill and so has no exact data as to cost. Figuring maintenance at the same rate as during his connection with the work, and barring accidents, the cost should have amounted to about 3 cts. per cu. yd. of embankment.

A Modern Stone Crushing Plant of 600 Cu. Yds. Capacity Per Hour—Some Costs of Drilling of Maintenance of Plant, and of Erecting Machinery.

With the ever increasing demand for crushed stone for various engineering constructions and for industrial uses, the production of this material has increased, in the last few years, to enormous proportions.

The increase in the demand in Chicago and vicinity in particular, is due to the great activity in all kinds of building and other construction, and also partly to the development of iron and steel manufacture in the Calumet region, where a large quantity of limestone is required for use as a flux in the blast furnaces.

Southwest of Chicago, along the line of the Chicago Main Drainage Channel are large deposits of limestone, which outcrop on the surface. Many crushing plants, large and small, are in operation in this district. Among these plants is the new plant of the Dolese & Shepard Co., of Chicago. This plant was built in a period of ten months, after the burning of a former plant on the site, and has now been in operation eight months. This plant is interesting as a whole, because of its capacity and its output, and is interesting in detail because of many features which are departures from standard methods and which in many details are of original design. Many of these features are due in a considerable degree to Mr. Geo. W. Patnoe, Master Mechanic and General Superintendent for the company, who has been in direct supervision of the design and construction of the plant. The whole plant is the outcome of 30 years of experience in the business of quarrying and crushing stone for the Chicago market.

Quarry.—The company owns about 300 acres of land of which 130 acres are available for quarrying purposes to a depth of 150 ft. as tested by core drills. It is estimated that it would take about 75 years to exhaust the rock within the limits examined. The quarry was opened a few years ago and, up to the time of the destruction of the plant by fire in the early part of 1908, was operated according to standard quarry methods. The quarry as now opened has an area of about 21 acres and a depth of 40 ft.

The new system of quarrying and handling the rock consists of drilling with well drilling machines and loading the rock with steam shovels into electrically operated dump cars. The well drilling machines have proven a decided economy over the smaller tripod drills. Records have been kept which show each day's work with length of time worked, depth of holes drilled, time not drilling and for what reason, quantity of repairs, name of drills and date. Table I shows a record of six well-drilling machines. This record is taken from the daily reports for 30 consecutive working days. The holes were 5⅝ ins. in diameter and 40 to 45 ft. in depth. According to records the power on the electrical blast hole drilling machines costs from $1.80 to $2.00 per 10-hour day, whereas the power on the tripod air drills costs $5 to $5.20 per 10-hour day. Only one-third as many of the larger holes are required for breaking up the rock as of the smaller holes.

When the new plant was started it was intended to use electrical equipment throughout, and a trial was made with an electric shovel. This, however, proved too slow for the work. The company furnishing the shovel put it out as an experiment and will replace it with a steam shovel. The swinging motion worked very satisfactorily, but the 200-h.p. motor could not accelerate fast enough for handling the dipper at the required speed. The capacity of the shovel did not exceed 1,200 cu. yds. in 10 hours. The steam shovels are expected to handle 1,800 to 2,000 cu. yds. in that time.

Fig. 1.—View of Quarry and Crushing Plant of the Dolese & Shepard Co., Near Chicago, Ill.

Another of the departures from the ordinary, was the adoption of an electric haulage system. This system uses a third rail placed in the center of the track and the cars are controlled by one man who is located in a tower which commands a view of the greater part of the track system. This system is the invention of F. E. Woodford, President of the Woodford Engineering Co., Chicago, and was installed under his direction. An installation of this system for canal work was described in our issue of May 18th, 1910.

Much discussion was caused in engineering circles when this system was installed for stone quarry use, and many predictions of its failure were made. It is true that the cars have cost the owners almost as much for repairs as they cost new. The experience was necessary, however, to perfect the mechanical features and make the cars strong enough to stand the jolts and wear from this class of work.

The quarry company considers that this experience has proven, in spite of the excess maintenance cost during the first few months, that the system is worth all the money put into it. A brief description of the new cars is as follows: The average weight is 26,300 lbs., and the capacity is 12 cu. yds. Each car is equipped with two 30 h.p. motors using a direct current at 220 volts, and has an automatic brake which controls this speed of the car on down grade and another arrangement which enables the tower man to set the brake. The tower man controls all movements of the cars from a centrally located tower house.

The chief annoyance was the constant breakage of the cast iron cores in the resistance coils placed upon the car for the automatic control of the brake. This caused several smash-ups and the remedy was found in substituting iron wire in place of the cast iron piece. The car was further strengthened by using steel box beams in place of the channels first used. The bottom of the car was changed from 4-in. to 5-in. planks and the steel plate lining was divided up into sections, held down with T-irons as shown by Fig. 3.

The maintenance of the first 25 cars put in service required the time of three men in the repair shop. With the cars now in use the maintenance will not, it is figured, exceed $5 per month per car. With this system the labor required for bringing stone from quarry to crusher is but one man. The power required for bringing 4,000 cu. yds. of rock to the crusher costs $22, according to the records.

Automatic Weighing.—Each car is weighed automatically as it passes over the scales and is not required to stop. The number of the shovel which loads the car is also taken at the same time by an automatic arrangement. These figures are stamped on a tape by the machine in the scale house, and the tape figures are sent to the main office each night. In this way an absolutely accurate record is kept of the number of cars loaded by each shovel, each day, of the weight of the material on each car, and of the total for all. By this method deficiencies can easily be located. The cars are dumped by an electrically operated pneumatic lift which is controlled by the tower man.

Electrical Equipment for General Plant.—There is no power house, but the electric current is furnished by a transmission line (carrying 33,000 volts) from the Economy, Light & Power Co.'s power plant at Joliet, Ill. Provision is also made for connection, in case of emergency, with one of the Commonwealth Edison Co.'s plants, in Chicago,

In the sub-station, the current is stepped down from 33,000 to 480 volts with three 750 k.w. transformers supplying three-phase current at 60 cycles to the motors throughout the plant. There is one 400 k.w. and two 200 k.w. Allis-Chalmers' motor-generator sets supplying 220-volt direct current for the electric haulage system. There is also a complete equipment of measuring and recording instruments for indicating the power required in different branches of the work. Each building contains a transformer to step down the 480-volt current to the 120-volt lighting circuit. The entire plant requires about 1,600 h.p.

by Figs. 1 and 2. The buildings are of structural steel covered with galvanized corrugated iron. They rest on concrete foundations. Two of them, the No. 9 crusher building and the main screenings house, are built directly over reinforced concrete bins. Each building contains an overhead traveling crane or trolley hoist for handling the machinery in erection or in repair work. The crane and hoist runways extend outside the building over a sidetrack.

The main crusher, a McCully gyratory No. 21, is stated to be the largest made. It has a two-arm spider and its ordinary capacity is about 6,000 cu. yds. of rock in 10 hours, but this can be exceeded by 50 per cent if required. The total weight of the machine is 225 tons. It is driven by a 250 h.p. motor with rope transmission.

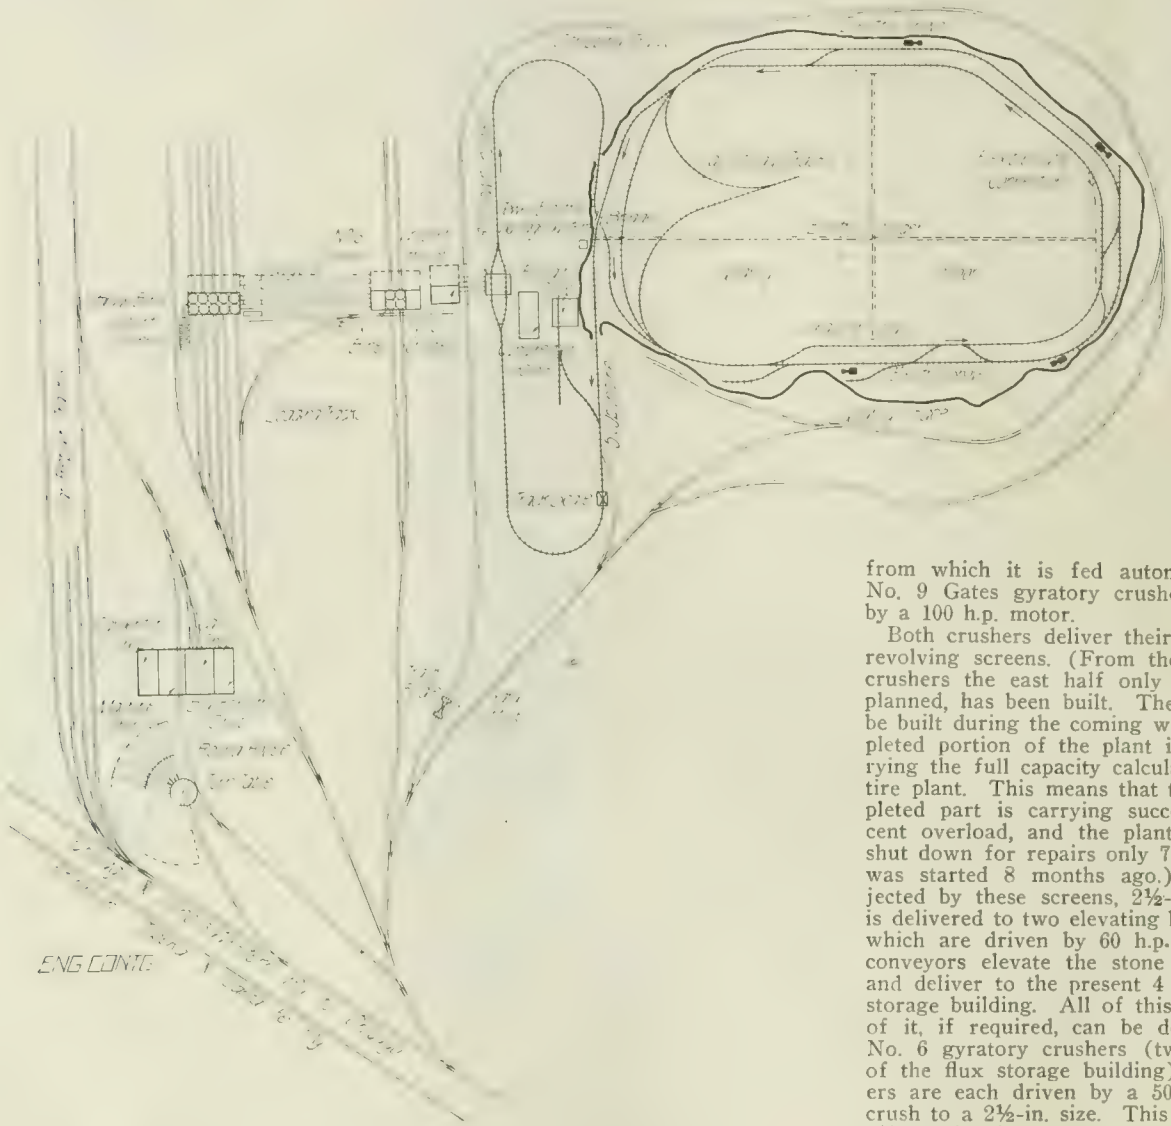

Fig. 2.—Lay-Out Plan of Quarry and Crushing Plant Shown by Fig. 1.

The main crusher discharges its product in 6-in. size onto two parallel bucket conveyors. The crusher discharges on both, or on either side as desired. These conveyors elevate the stone on a 45° incline to the top of the next building, and deliver it to a large steel bin from which it is fed automatically to two No. 9 Gates gyratory crushers, each driven by a 100 h.p. motor.

Both crushers deliver their product to two revolving screens. (From these No. 9 Gates crushers the east half only of the plant as planned, has been built. The other part will be built during the coming winter. The completed portion of the plant is, however, carrying the full capacity calculated for the entire plant. This means that the present completed part is carrying successfully 100 per cent overload, and the plant has had to be shut down for repairs only 7½ hours since it was started 8 months ago.) The stone rejected by these screens, 2½-in. to 4-in. size, is delivered to two elevating bucket conveyors which are driven by 60 h.p. motors. These conveyors elevate the stone on a 45° angle and deliver to the present 4 bins of the flux storage building. All of this stone or a part of it, if required, can be delivered to four No. 6 gyratory crushers (two on each side of the flux storage building). These crushers are each driven by a 50 h.p. motor and crush to a 2½-in. size. This product and the 2½-in. size from the No. 9 crushers are delivered to two 30-in. belt conveyors which are about 350 ft. long and are on an incline of 23°. Each is operated by a 60 h.p. motor. These belts deliver to the main screen house. This house now contains, four revolving screens 4 ft. in diameter and 28 ft. long, with 16-ft. jackets, four revolving screens 4 ft. in diameter and 24 ft. long, and four shaking screens, 3x12 ft. The two belt conveyors discharge into the 28-ft. revolving screens whose rejections are in turn discharged into the 24-ft. screens which have larger perforations. The stone that passes through the first revolving screens is delivered to the shaking screens, which separate

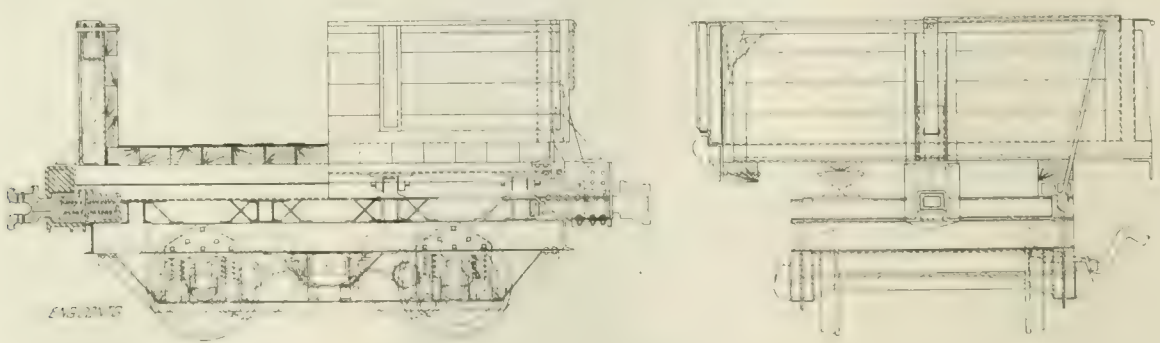

Fig. 3.—Details of Electric Quarry Car.

Crushing Plant.—The crushing and screening plant occupies five buildings which are connected with each other by belt and bucket conveyors. The general arrangement is shown

Note.—The renewal of rope is required on an average of once in 30 days. Two men are required to operate one machine, but where several machines work close together the number of helpers may be reduced.

it into smaller sizes and it then passes to the storage bins. The rejections from the revolving screens are delivered by horizontal conveyors to the recrushing rolls house. This house contains two sets of rolls 54 ins. in diameter and 24 ins. wide, having the surfaces fitted with chilled iron corrugated plates of the herring-bone pattern. There are also two sets of rolls, 36x16 ins. for crushing to ½-in. size or less. Two 100 h.p. motors operate the rolls by belt transmission. Each motor is belted to a shaft to which is belted one set of large rolls and one set of small rolls.

The horizontal conveyors mentioned, were designed especially for this plant. Each consists of a rubber belt to which steel strips 2 ins. wide are fastened crosswise to the belt, and bent up on the ends. These are placed side by side and form a rectangular trough. These belts are fitted with speed changing devices, so as to vary the amount of stone delivered to the rolls. The recrushed product is delivered on a return belt to the main belt, and by it again to the screening plant where it passes a second time through the screens.

The general arrangement of the plant is designed so as to make possible its operation in subdivisions, each subdivision being operated in connection with others or shut off as desired according to the required capacity of output. It is also arranged, so that, by use of a belt conveyor any of the bins of the larger sized stone may be emptied and carried to the recrushing plant.

All chutes are lined with vitrified brick and wherever possible at the junctions of chutes, where there is a constant dropping of stone, pockets are made which collect just enough stone to protect the chute from wearing.

The storage bins are at present 10 in number, each being a cylinder 20 ft. in diameter and 32 ft. deep and having a capacity of 400 cu. yds. They are of reinforced concrete with walls 8 ins. thick (12 ins. at points of contact with adjacent bins or the side walls of the building). The bottom of the bins is a 14-in. slab of reinforced concrete which covers the entire area of the building. The bins are supported on heavy square, reinforced concrete columns. Five loading tracks pass under these bins and have a clearance of 22 ft. above the rails. Under the bins for the storage of the 4-in. flux stone are two loading tracks.

Each bin is fitted with a gate for discharge into the cars. These gates are operated by compressed air. The pipes lead to a central point so that one man can operate four gates at a time. A 50-ton car can be loaded in this way in about one minute.

The scales for weighing the loads will eventually be transferred to below the bins. Here the weight of the empty car can be taken automatically and the scale beam set at the weight which equals the capacity of the car. An arrangement will be made to provide an electrical contact which will cause the pneumatic apparatus to close the discharge gates.

This plant can supply stone of any size from rip rap to a fine dust which will pass a 100-mesh sieve. It can also supply stone in mixtures of different sizes, being so mixed as to be made into concrete by simply adding the necessary cement.

Washing Plant.—For the purpose of providing a small, clean stone for reinforced concrete work, a washing plant is being constructed. This plant will be located southeast of the storage bins (see Fig. 2) and will be a timber frame structure covered with galvanized iron. Figure 4 shows a section of this building. Arrangement is made here for washing all sizes of stone from 1¼-in. down to the size of torpedo sand. The material is washed in running water and the product screened as shown in the drawing. The last stage of the washing process is as follows: The fine material and the water finally reach the automatic gravity dump box marked *A* in Fig. 4, and which is shown in detail by Fig. 5. The bottom of this box, as shown, slopes down from the receiving end to the dumping pipes, *A*. The fine material fills up the triangular section and the water flows out at the spout *B*. When sufficient pressure is exerted by the weight of the material, the diagonal bottom tips on the axle *X*. This lowers the outlet pipes away from the beam *C* (this beam acts as a stopper) and the material flows out through the pipes until enough weight is released to turn the balance in the opposite direction. Then the bottom swings back and the process is repeated.

Maintenance and Depreciation of Plant.—The general plant is, of course, built on modern principles and the design and selection of all machinery is the result of many years of experience. It was intended to build a plant which would be of the greatest efficiency possible with the best machinery obtainable. According to experience the company has estimated the life of the plant at 20 years. That is a 5 per cent annual depreciation on the plant. The maintenance and repairs for the machinery of the crushing plant varies for different machines. Crushers cost about 5 per cent of their value annually while for the screens and conveyors this cost amounts to 15 per cent. The larger sized stone wears the screens much faster than the smaller. An example of this is shown in the

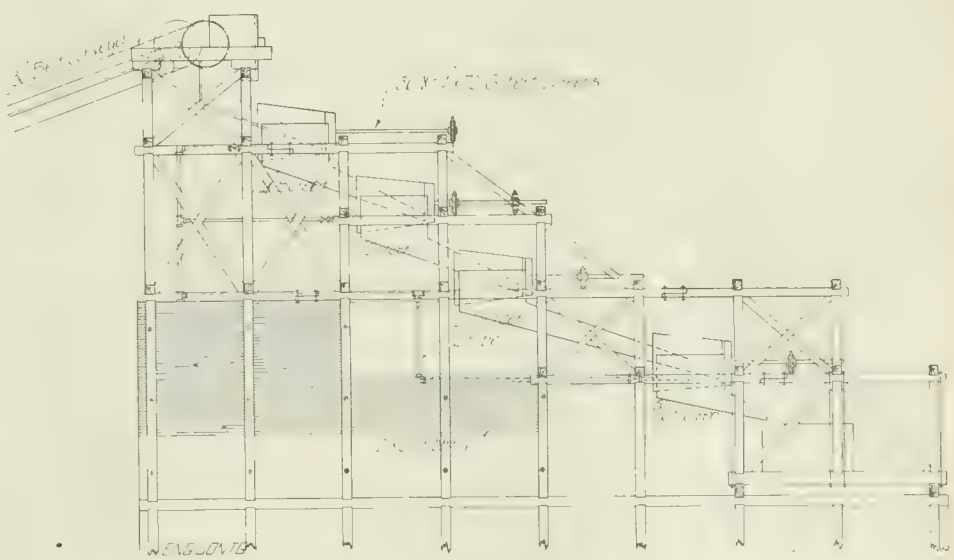

Fig. 4.—Section of Washing Plant.

fact that the screens which take the product from the No. 9 crushers, had to be renewed after 6 months' service. They were of ½-in. material with 3½-in. holes. The screens in the other part of the plant which handle nothing over 2½ ins., have now been in service 8 months, are of ⅜-in. material and show very little wear. All screens when renewed will be of manganese steel.

It is interesting to note in conclusion that there are approximately 960 tons of crushers, screens, and elevators in the plant. This machinery was erected by contract by Olson Bros. & Co., Engineers and Contractors, Chicago, Ill. The cost of erecting this machinery amounted to about $13,000. The contractor had the use of the cranes in each building and was able, with these, to handle all heavy machinery directly from the cars to the foundations. The cost of placing the heavy crushers ran as low as $8 per ton and the cost of erecting the lighter machinery, such as belts, etc., ran as high as $30 per ton.

For the use of the photograph we are indebted to Mr. R. H. Hall, Commercial and Engineering Photographer, Chicago, Ill. We wish also to acknowledge the courtesy of the officials of the Dolese & Shepherd Co., especially of Mr. Geo. W. Patnor, Master Mechanic and General Superintendent, and Mr. A. V. Konsberg, Purchasing Agent, for the information and drawings from which this article has been prepared.

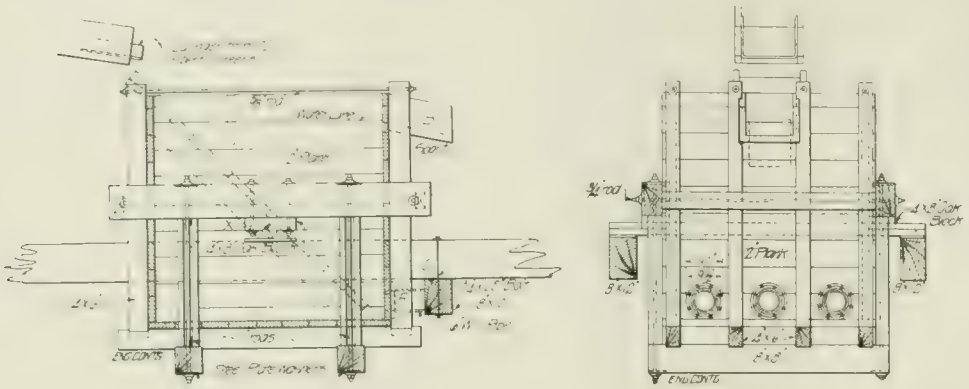

Fig. 5.—Automatic Gravity Dumping Bin for Washing Plant.

Earthwork Shrinkage, Application and Amount.

BY F. B. ESPENSHADE *

How much earthwork shrinks and the comparison of excavation and embankment quantities are very important subjects upon which the opinions of engineers are much at variance. They are also much mooted subjects between engineers and contractors. Shrinkage is usually applied in several ways:

(1) By raising the height of crown above the established subgrade by a percentage of embankment height.

(2) By adding additional width to the standard crown width.

(3) By combining methods one and two.

(4) By adding a shrinkage percentage to the height of embankment, computing a new slope distance for this corrected height, thus increasing the width between slope stakes.

While I have known engineers to use the last method, it seems unusual and defeats the purpose of shrinkage, as it adds width to the embankment where gravity and the action of the elements naturally provide it. In cases where sliding or sloughing is to be expected, it is better practice to increase the slope ratio.

The first method of applying shrinkage to the height of embankment fulfills all requirements, if the embankments are light or of considerable length. But in heavy country where the profile of the ground surface indicates short, heavy fills and short, heavy cuts following each other in rapid succession, it is preferable either to apply the shrinkage by adding to the height and width of crown or chiefly to the latter.

The amount of shrinkage added, under different conditions that arise, is quite variable. This is as it should be, as the methods of construction and materials vary within wide limits. It has been my experience that the allowance for shrinkage is usually less than the total settlement that the embankment undergoes while attaining its permanent set. This seems expedient in many cases where the track laying closely follows the roadbed construction.

Were the necessary shrinkage to obtain the established subgrade at final settlement added to the height in short, heavy fills, anomalous conditions would result. In such cases, if the greater part of the shrinkage is not provided for by increasing the crown width, it is much better not to apply any than to attempt to add a sufficient shrinkage above subgrade, if track laying follows before the embankments have settled appreciably. Considering the ease with which gravel and other good material can be placed in many instances, it may be wise to omit the shrinkage on short, heavy fills or at bridge approaches or the greater part of it.

In "Civil Engineer's Pocketbook," by John C. Trautwine, on page 799, under Shrinkage of Embankment we find the following paragraph:

> Although earth when first dug and loosely thrown out swells about 1-5 part, so that a cubic yard in place averages about 1 1-5 or 1.2 cubic yards when dug, or one cubic yard dug is equal to 5-6 or to 0.833 of a cubic yard in place, yet when made into embankment, it gradually subsides or settles or shrinks into a less bulk than it occupied before being dug. The following are approximate averages of the shrinkage; or, in other words, the earth measured in place in a cut, will, when made into embankment, occupy a bulk less than before by about the following proportions.
>
> Gravel or sand, about 8%; or 1 in 12½ less.
>
> Clay, about 10%; or 1 in 10 less.
>
> Loam, about 17%, or 1 in 8⅓ less.
>
> Loose vegetable surface soils, 15%, or 1 in 6⅔ less.
>
> Puddled clay, about 25%; or 1 in 4 less.

I have known most estimable engineers of wide experience to testify as expert witnesses in court that earth does not occupy less space in settled embankments than in the original position in cut. However, it is usually conceded by engineers that average material, such as gravel, clay and loam, does occupy less space in embankment finally than originally in cut.

It does seem that Mr. Trautwine's figures are very high. Following his assumption that loose dirt occupies about 20 per cent more space in embankment than in excavation and that 1 cu. yd. of this loose material afterwards settles to 0.83 of its original bulk in place, we get a total shrinkage equal to 30.8 per cent of the loose bulk. Embankments built by wheelbarrows approach "loosely thrown out" material, as the tramping and wheeling on the embankment are of little consequence.

In the wheelbarrow embankments that have come under the writer's experience he has used 15 per cent and while it has seemed too small it certainly did not lack more than 4 per cent in any case of providing correct subgrade at the end of two years. These embankments were made from clays and loams saturated with water, as the wheelbarrow is used today only on such work. As the material was extremely wet we would expect the shrinkage to approach puddled clay.

For puddled clay Mr. Trautwine would have about 60 per cent shrinkage, allowing that 1 cu. yd. in excavation makes 1.2 cu. yds. in embankment and settles afterwards so as to occupy 0.75 cu. yd. Johnson's "Surveying" mentions that clay and loam dumped loosely increases about one-twelfth at first and then settles to about one-sixth of this increased volume. These opinions differ widely. One claims one-fifth and the other one-twelfth swell for loosely thrown out material.

The writer has counted wagon loads taken from cuts, the wagons were measured and loaded fully to the measured volume or over, and has found that the increase is fully one-third. With wagons as usually loaded when a contractor is doing good work, if the swell be considered as 50 per cent or if two-thirds of the wagon load measurement be used, the estimate thus taken would approximate the excavation measurement.

This experience with wagons varies so widely from that with the wheelbarrows that it seems that the wide difference must be due to the variance in the nature of the material and the size of bulk considered.

For light fills, less than 4 ft., constructed by slips and wheelers, and containing clay and loam, I have used as high as 12 per cent shrinkage on embankments with good results. Or what is better for this kind of work is to have the contractor roughly build the embankments to grade, allowing the work to remain several months, during a period in which the embankment becomes thoroughly wet from rains, then add about 10 per cent shrinkage. Where the time and rain are sufficient this latter method gives good results. If the vegetable matter is small as in the case of deep borrow pits 10 per cent for newly built and 8 per cent for embankments of long standing do very well. The vegetable matter is very important to allow for, even when removed by burning as much as possible. This is especially true where grass roots and stubble occur in fills less than 2 ft. and if shrinkage is added up to 20 per cent for such fills no fear need be entertained that embankments will not settle to subgrade.

I have compared the excavation quantities quite frequently with embankment quantities. Where a shrinkage of from 8 to 12 per cent was used in prairie country, the excavation measurements usually exceeded the embankment quantities from 5 to 8 per cent. Where embankments were completed promptly, allowing 10 per cent shrinkage, the excess excavation quantities could be expected to be close to 6 per cent unless there was a loss or the material was unusual. This has followed in the writer's experience very often with clay and loam and the settled embankments usually approached the true subgrade quite closely.

With shrinkage applied in this manner varying from 8 to 12 per cent the embankments in every case seemed to settle to subgrade or below it by a very small percentage. Mr. Johnson claims that 100 cu. yds. of embankment will require 111 cu. yds. excavation. This is variously estimated by text book writers from 108 to 115 cu. yds. for the excavation equivalent of 100 cu. yds. of settled embankment. I consider that the initial swell of the material is much more than Mr. Trautwine or Mr. Johnson states for loose material and that 100 cu. yds. in embankment usually requires less than 111 cu. yds. excavation. This percentage of excess is very important from the contractor's point of view when the contractor is paid in embankment, as he sometimes is. The question arises, "What is the contractor to be paid for?" Certainly he should not be paid for embankment quantities without an additional allowance for the increased mate-

* 6235 Greenwood Ave., Chicago, Ill.

rial required for embankments in excess of the excavation quantities.

This additional allowance may be very misleading if applied to unusual conditions. The writer experienced very unusual conditions on a 16-mile section of railroad work on the Pacific coast extension of the Chicago, Milwaukee & St. Paul Ry. in Montana, where the excavation quantities exceeded the embankment quantities by 25 per cent and on some miles by as much as 30 per cent. The contractor was paid in excavation with overhaul for distances in excess of 500 ft. The center line of roadbed crossed and touched a river channel 33 times; the channel crossings were filled in and the stream was diverted on the outside of the railroad right of way on a special right of way for channel changes, which was usually parallel to the railroad right of way. The material excavated from the new river channel was used to make the embankment. The embankment at the river crossing was protected by a false berm 10 ft. wide and above high water mark on the side exposed to the new river channel and a lower and narrower berm on the old channel side. All embankment quantities were measured in the usual manner in the roadbed, and false berms were measured as constructed, which included the shrinkage. As this work extended over a period of 1½ years and the season when the channels were closed was notable for floods and extreme high water, the loss by washing, which in many cases was impossible to measure, was excessive. A dam of rock, hay or sand bags was used to stop the flow in the old channel, forcing the water into the new channel, which was taken out to a narrow section first and widened later to complete the new channel and finish the embankment.

The shrinkage used on this work was from 8 to 10 per cent, applied on top for the light fills and by increased width and top shrinkage at the old channel crossings. The work averaged 30,000 cu. yds. per mile. The contractor was paid in excavation. Many of the new channels required four or five separate cross sectioning and carefully platted sections in order to keep close record of the action of the water. Very large volumes of material were lost by erosion where the channels were open, while at other times the overflow water deposited equally as large volumes in unopened channels.

This instance of unusual difference between the excavation and embankment quantities is of little value for comparison of how much earthwork shrinks, but illustrates the necessity of the contract being specific on the method of measuring pay quantities. Frequently contracts read that the contractor is to be paid excavation measurement or embankment measurement "when in the opinion of the engineer" it is not deemed advisable to use embankment measurement. The engineer might deem it advisable to give embankment measurement even in an unusual case, as stated above. The "opinion of the engineer" is a very uncertain factor to overcome in bidding and may mean the entire profits of the work to the contractor. Where there is no excessive loss by water and the rate and manner of applying shrinkage have been determined beforehand, the "opinion of the engineer" may vary for embankment measurement from allowing no excess to at least 10 per cent, depending upon who the engineer is. No doubt some contracts are drawn that overcome this uncertainty, but the writer has never seen a contract on any work that has come under his supervision that recognizes the fact that excavation quantities exceed embankment quantities.

I have observed that the excess is about 6 per cent for clay and loam when 10 per cent shrinkage is used upon embankments. Is this percentage nearly correct? The writer would like to hear the experience of engineers on this subject. It is not likely that where the opinions of text book writers and engineers of experience differ widely these views will agree with my experience, but it is hoped that opinions expressed on this much mooted subject may be valuable in determining the amount of shrinkage to apply for railroad embankments and whether there is excess material required for embankments, above and beyond excavation quantities, and how much.

I wish to refer to the large personal error that frequently occurs in cross section work. It should be the endeavor of the engineer to find the cubic yards and it might be better to give less thought of the tenths of cubic yards, which is a fineness beyond the ability of most of us. I have known an old engineer in the employ of a contractor who even went so far as to think the use of tenths of cubic yards in a note book should be sufficient cause for dismissal. Railroad companies require the cross section notes computed to tenths of a cubic yard. It certainly is beyond the accuracy of engineers to cross section to the nearest cubic yard in many places.

Cross sectioning is often spoken of slightingly by engineers as an approximation at best; the engineer should make the work a study and endeavor to do good work. The personal error is frequently high and usually works a hardship upon the contractor unless the rodman has a cultivated faculty of holding the rod only so as to be advantageous to the contractor.

I consider 8 to 12 per cent for wheelers and slips, 10 to 15 per cent for wagon work and 15 to 20 per cent for trestle filled embankments from cars, varying according to material and local conditions, as being not wide of the mark. The manner of applying the shrinkage must be adapted to the case in hand. In heavy fills that are long very good results can be obtained by establishing a temporary grade line that fulfills the shrinkage requirement at the crucial points and not wide of the mark over the entire embankment. This latter method of applying shrinkage is quite easy and provides an embankment that *is* ready for the track.

Annual Meeting of the Society for the Promotion of Engineering Education.

As a part of the program for the meeting of the Society for Promotion of Engineering Education this summer, it is proposed to organize a symposium on efficiency in engineering education. This subject will be discussed under the following heads:

(1) Organizing and systematizing the work of the students; methods of arousing their interest and of encouraging them to make the best use of their time and opportunities.

(2) Organizing and systematizing the work of instructors so that each department of study shall have its due share of the student's time and energy, and no more.

(3) Conduct of recitations and examinations, control of outside reading, study, and problem work so as to secure the best results.

(4) Improvement of lecture instruction; use and abuse of lectures; utilization of syllabi, indices, bibliography and encouragement of outside reading; lecture illustration, experiments, use of blackboard, models, diagrams, lantern slides; economy of student's time and energy and methods of securing his attention in lecture period. Advantages and disadvantages of printed lecture notes.

(5) Relative advantages and disadvantages of lectures and recitations. Subjects suited to one or the other method of instruction. Limitations of each method.

(6) Improvement of laboratory instruction; in the preliminary preparation of students, in the supervision of laboratory work, in the character of the work required, in facilities for work, in reports of work done, and deductions therefrom.

(7) Improvements in shop work instruction. Relative importance of manual training and study of actual shop practice. Should manual training form any part of the curriculum?

(8) Organization of vacation work. Assignment of time to different subjects. Utilization of time to best advantage. Class work versus individual study. Should students be encouraged to seek remunerative employment by allowing academic credit for such work?

(9) Graduation theses. In what ways can these be made more useful?

(10) Original investigation. Is it desirable to have the graduation theses involve original investigation by the students?

The committee on mathematical instruction will report at the meeting of the society at Madison, June 23, 24 and 25. As a basis for the discussion of this report the following questions have been suggested:

(1) What proportion of the students in engineering schools, who have completed the required work in calculus, are able to apply that knowledge and solve simple, practical problems?

(2) What proportion of the graduates of engineering schools, who receive instruction in calculus and in its application to mechanics, thermo-dynamics and engineering are capable of using calculus as a tool, readily, with difficulty, or not at all?

In all cases where these two questions have been put the answer invariably has been that the percentage of students who can make use of the calculus is very small, ranging from two to ten per cent. This indicates that the instruction in calculus fails lamentably in securing the desired results, which suggests the following further questions:

(3) Is the proportion of students who can utilize their knowledge of calculus materially above the average in any institution in the country? If so, why?

(4) Is it possible to increase the efficiency of instruction in calculus in one or more of the following ways:

(a) By omitting certain portions of the calculus as now taught and concentrating the work on a more limited field, so as to secure better results.

(b) By abandoning the highly theoretical treatment of the subject and teaching it as arithmetic is taught in the elementary schools, with very limited emphasis on the theoretic side and major emphasis on its practical application. We do not instruct children in the theory of numbers, but give them practical rules for addition, subtraction, multiplication, division, etc. The result is that the large majority of those studying arithmetic are able to use these rules successfully in everyday life.

(5) Is it desirable or necessary to provide additional time for instruction in calculus, and should this instruction extend through two, three or four years of the engineering course? Should this additional instruction be entrusted to the department of mathematics, to the department of mechanics, or to the engineering departments, and in what proportion?

(6) Is it desirable or necessary to give instruction in other branches of higher mathematics to students in engineering schools, and if so, what adidtional subjects should be taught and how much time should be allotted to each respectively?

It is felt that no more important subject has come before the Society. If the failure to secure adequate results is due to insufficient time given to the subject, the time given should then be increased, even to the extent of eliminating some of the higher studies in engineering. Calculus is a subject that can not well be acquired by the student after he leaves the engineering school, while engineering studies can be pursued to any extent desired in after life.

The Netherlands is strongly urging the canalization by Belgium of the Meuse from Vise to Keesnich, a distance of 39⅛ miles, in order to facilitate inland navigation from the Liege industrial region to the port of Rotterdam, which has become a formidable competitor of Antwerp. The freight service from the basin of Liege to Antwerp is at a disadvantage as compared with that to the Dutch port. Freight rates are lower from Liege to Rotterdam than to Antwerp, notwithstanding the distance between Liege and Antwerp is shorter.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

English Methods and Experiences in Dust Prevention and Road Preserva ion and in the Construction of Tar Bound Roads.

English road engineers were among the first to recognize the necessity of some treatment for macadam roads to prevent dust and also to preserve the road surface. As a result a large amount of experimental work has been done in England, both in the use of dust preventives and road preservatives and also in the construction of motor proof roads. The methods employed by the English road authorities in their work and the results attained are of no little interest, and we have accordingly abstracted and rearranged the notes that follow from the special roads issues of April 15 and 22 of the *Surveyor* and from the April 29 issue of the same paper. The notes in the main refer to the work done during 1909.

TAR PAINTING AND TAR SPRAYING.

Aylesbury.—The length of road tar painted was 3.81 miles, the area being 46,398 sq. yds. The cost per sq. yd. was 1.246 cts.; 8,196 gallons of tar, or .17 gallon per sq. yd., were used. Tar cost 3 cts. per gallon. About 23 tons of sand, or 1.1 lbs. per sq. yd., was used. The method of painting was as follows: The tar was heated in a 50-gal. boiler, sprayed by small sprayer attached to boiler and spread with brushes by hand labor only. Tar painting effected a saving of about $200 in street watering, reduced the dust nuisance and effected some economy in scavenging; the roads in general derived considerable benefit.

High Wycombe.—Ordinary gas tar applied by hand was used in tar painting. Treatment proved very beneficial so far as dust prevention is concerned and also proved a surface preservative. This was particularly noticeable on a section of Tarmac which was partially painted.

Barnstaple.—During the year 17,000 sq. yds. of road surface was tar painted by hand labor at a cost of 1.8 cts. per sq. yd. "It must be admitted," states the borough surveyor, "that the continuous wet weather during the autumn and winter in this district has to a very considerable extent spoilt the effects of the tar coating. So far as surface protection is concerned, and the present condition of much of the road surface tarred last summer, shows that the tar has entirely disappeared. My experience is that tar painting, to warrant the expenditure upon it, should be effective for practically a year. There is no saving in scavenging whatever where the traffic is at all heavy; in fact, the scavenging costs more, for I found it necessary to water frequently during dry, windy days. There is no doubt that tar painting (being comparatively cheap) is the most popular method of dealing with the dust nuisance, but where the treatment is subject to ordinary town traffic the effect is worn off in six months. On the country roads, however, given a normal winter, the treatment will last for about a year. I prefer hand labor to machine for this work, but of course the former method is too slow to allow of any considerable area being done in a short time."

Gloucester.—The city last summer purchased a new 320-gal. tar boiler and did a great deal of tar spraying, the hot tar being distributed by means of a flexible hose worked by hand, pumped direct from the boiler by a hand pump attached thereto. The cost of the tar painting work was as follows:

	Per sq. yd.
Materials	$1.16
Labor	.54
Total	$1.70

Regarding the work the city surveyor states: "The success of tar spraying depends entirely upon it being done in dry weather on a road with a good surface, and the longer the time the hot tar can remain on the road before being sanded, and before the traffic is allowed to go over it, the better. Undoubtedly tar painting, when done under satisfactory conditions, very much reduces the dust in summer; it also reduces the amount of mud in winter, but what mud is made is of a nasty black sticky nature. The tar painting requires to be repeated in the following summer, and is then much more effective than the first coat, provided always that the road has still a good surface. It is absolutely essential that tar painting should only be applied to a road which is in a thoroughly good condition, and although there are no wearing properties in the tar itself its effect is to waterproof the surface of the road and thereby to prevent mud and consequent dust being worked up from the subsoil below. If a road is very much worn indeed, requiring a heavy coat of stone, I should then prefer coating it with tar macadam in preference to making up as before with ordinary stone and then tar painting.

Exmouth.—Tar painting has been carried out in this place for the past five years, and so successful has it been that the quantity executed has been steadily increased each year. On the roads where there is heavy traffic the life of one coat of tar paint has been about five to seven months in the middle of the road, though on the quarters it has been much longer than this, say two years. On medium and light traffic roads the life is equal to two summers. The cost of road maintenance is reported to be reduced by tarring 10 to 15 per cent per annum. An area of 91,370 sq. yds. was tarred in 1909 at a cost of about $1,000. The grit used for spreading over the tar was obtained free on the beach.

Alton.—The surveyor reports tar painting has greatly reduced the dust, and has been found, by watering and sweeping with horse broom once weekly and daily scavenging of horse dung, to give good results. A tar spray machine is used. When rain appeared likely to spoil newly laid tar the surface was covered with hot sand with satisfactory results.

Basingstoke.—At this place experiments were carried out last year both by tarring under pressure and also by hand. Typical costs follow. Tarring main London to Winchester road using Tarroads machine with engine; total length tarred 543 yds., area 2,990 sq. yds.; 5 sq. yds. per gallon of tar estimated:

	Per sq. yd. Cents.
Manual and team labor preparing road and spreading grit, etc.	$0.40
5½ tons ¼-in. to dust granite, at $2.50	.41
Tarring, one coat	1.76
Total	$2.60

Tarring by hand labor street in center of town; ordinary gas works tar, boiled; length tarred 220 yds., area 2,283 sq. yds.; 5½ sq. yds. tarred per gallon of tar:

	Per sq. yd. Cents.
Manual and team labor, preparing, tarring and guttering road	$0.60
108 gals. tar at 3 cts.	.51
6½ tons granite dust at $2.50	.72
Coal and incidentals	.06
Total	$1.92

The council considered the various lengths tarred very satisfactory as regards dust abatement, quick drying after rain and reduced scavenging.

Tonbridge.—The rural district council engineer reports that the experience of the past winter has proved to him that there is an advantage in using a tar compound over ordinary tar; that unless the road previous to being treated is in good condition the effect soon disappears in wet weather; that tarring surfaces of any road from light up to medium traffic is an economical means of road maintenance, but with heavy traffic roads the tarring is only an expensive palliative for the dust question, and a better system of road making in the way of tarred macadam of some nature other than the water bound system must be adopted.

Market Harborough.—Tar painting of main roads in this district was commenced in 1906. The cost per sq. yd. for hand painting has been 1.60 cts., practically half of which is for labor, and the remainder for materials and carting. The engineer reports that the advantages of tar painting in this district are unquestionable in respect to the laying of the dust and the preservation of road surfaces. The only disadvantages that have been found are that at certain times of the year the surface gets a little greasy and granite chippings have to be thrown on. In tar painting the most serviceable result has been obtained when the tar is poured on a recently steam rolled road, of course waiting until the surface is dry. Half of the road is done at a time, as far as possible keping the traffic off, and gritting with ¼-in. granite chippings without dust—very sparsely spread—as it was found that the dust tended to make a film. It was found in this district that practically the tar painting does not withstand the winter, with the exception of that on the sides of a wide road.

Grimsby.—A few experimental lengths of tar painting were done in this district with varying results. Broadly speaking, it was found that where the streets get the benefit of the sun the experiment was a success. Where the streets are shaded from the sun during the warm hours of the day, the treatment has not been so successful. However, the process generally has been found to be successful and to diminish the quantity of both dust and mud until late in the autumn, when the disintegrating effects of the night frosts came into play, and the experience then was that the amount of mud in the case of those streets which had been thinly tarred was no greater and no worse than usual, but in the streets which had been thickly tarred the mud during the winter was exceedingly nasty. The method of applying the tar was as follows: The street was first well brushed and all dust removed; the tar was applied as hot as possible from a can with a rose similar to an ordinary watering can, and was at once brushed in by able-bodied workmen with ordinary brooms. A sand-drying apparatus was in attendance, and as soon as possible after the tar had been brushed into the road it was sprinkled with hot dry sand.

Woolwich.—Approximately six miles of roads were tar sprayed last season. The engineer states that from an experience and trial of several dust laying specialties he has come to the conclusion that up to the present tar spraying and painting is the least objectionable and most efficacious, when the work is undertaken on properly prepared roads in dry weather. He has found that such treatment leads to a substantial saving in the cost of scavenging, watering and maintenance.

Burnham.—The engineer reports that between four and five miles of roads were tar sprayed with highly satisfactory results. A considerable saving in the cost of scavening was effected, not a single load of mud having been created until well into November, and a large quantity of water was saved in street watering. Some cases of horses slipping occurred, all on limestone roads. On roads of granite no cases of slipping occurred.

Surrey.—The county surveyor reported that the past season was a particularly disappointing one for tar painting, as the weather except for very short periods was most unfavorable. He states that this resulted in a good deal of work being done under far from ideal conditions, and at a considerable increase of expense. The abnormally damp winter was singularly unfavorable to the life of the tar painting; and on roads subject to heavy

traffic, particularly in shaded and damp situations, the surface water-proofing was largely destroyed before the end of 1909, but there is no doubt the tar below the surface to a great extent prevented the water from passing through to the foundations, and was valuable in minimizing the damage due to the abnormally wet season. On exposed roads where the traffic was not heavy the waterproof coating has remained intact throughout the winter, particularly where the surface has been tarred in two consecutive years. While the results were undoubtedly less favorable than they would have been in a normal year, the engineer is of opinion that value was obtained for the expenditure incurred in the prevention of disintegration for several months, and in the measure of waterproofing afforded throughout the winter.

Godalming.—In this borough tar painting is done by hand, half the road being painted at one time, permitting the tar to sink into the road and avoiding as far as possible dressing the road with loose material.

Haywards Heath.—Last year five miles of roads were tar painted in this district with very satisfactory results, the continuous rain experienced during the summer having very little effect on the tarred surface, which remained hard and sound the whole of the summer and autumn. Ordinary crude tar from the local gas works is used, and the roads are painted by hand labor. For the above mileage three gangs of men are employed, each gang (six men) being supplied with a 50-gallon boiler. So far it has been found that the best local material with which to cover the tar is sea sand containing about 50 per cent of small pebbles. The tar is spread with an ordinary 3-gal. water can with a few large holes punched in the rose, and the boilers are fitted with draw-off cocks.

Horsham.—Several roads were tar painted last year in this district, and the results were found to be very satisfactory, as both the dust and also the mud nuisances were much abated, and the surfaces of the roadways much preserved from wear.

West Riding.—During the past three years many of the main roads in this district have been tar sprayed or tar painted. The county surveyor states that in his opinion tar, or a good tar compo, is by far the most effective and economical dust palliative on the market. He further states that the treatment of the surface of macadamized main roads in this district has produced very satisfactory results. The initial cost of the tar treatment in West Riding has been from about 2 to 3 cts. per sq. yd. when applied by machine, but when carried out by hand labor the cost has been at 1½ cts. per sq. yd. When the application has been successfully carried out the life of the macadam has been considerably increased, and the lengthened life the treatment gives to the macadam surface will be found to pay the cost of the application for each year of its life. The saving in the cost of scavenging and watering has also been found to be considerable.

Caversham.—The district county surveyor reports that "Tar painting in this district, although carried out under ideal conditions, and with the utmost care, has so far proved an absolute failure, and has simply resulted in sticky, black mud throughout the winter in streets where there has been average traffic. Perhaps this may be accounted for by the long spell of alternate frost and rain experienced during this year."

Abersychan.—Experience in tar painting in this district has been favorable, it being found that until the setting in of winter the surfaces remained in good condition and were fully preserved. After the break-up occurs the amount of mud removed from the tar painted surfaces has been found to be about 50 per cent less than that on unpainted surfaces.

Haverfordwest.—About 10,000 sq. yds. of road surface, mostly on the busiest street in the town, were tar painted last summer. The work was done by hand labor and cost about 2 cts. per sq. yd. on the average, including granite chippings. The best results were obtained by treating roads that were in a thoroughly good state of repair, all horse droppings and dust being swept off and removed, the tar applied direct from a tar-boiler boiling hot through a coarse rose of a large watering-pot and thoroughly worked into the surface with hand brooms. Immediately the painting was done it was evenly covered with a sprinkling of clean ½-in. granite chippings, and crushed into the surface with a 10-ton steam roller. The borough surveyor further states: "Although I have been tar painting in a small way for six years, last year was the first time I adopted this method. In previous years I always sprinkled the tar with sand or some fine binding material and left it to the traffic, but a very much harder and better surface was obtained with the granite chippings crushed in in the way I have described. It only needs to be run over about twice or three times to a place with the roller to make a perfectly satisfactory job. I have found tar painting to be highly satisfactory as a dust preventive and road preserver for the summer months, but I regret to say I have not yet been able to find any surface treatment that will prevent or minimize mud to any appreciable extent on a heavily-trafficked macadam road during the winter months. I treated a residential street in the way I have described last summer, and as a result it has been quite free from mud throughout the winter, and its surface is now in perfect condition, but this is not the case where heavy traffic prevails. Judging from my past experience of tar painting, I consider it is a most advantageous and economical treatment for roads that are in good condition, if it is done when they are thoroughly dry and clean, but I would not recommend it for roads in a bad state of repair, nor in any case under unfavorable climatic conditions."

Bolsover.—One section of road was tar painted last summer with crude tar from the city gas works. The work was done during the only dry week last summer; the roadway was thoroughly scoured of all dust for some time before hand, and the tar was spread from an old water cart and thoroughly swept in. Slag screenings were spread over this surface and traffic allowed on it the following day. The weather was continually wet ever since the treatment was applied and no good results have been had since Christmas.

Dumfries, Scotland.—The burgh inspector reports that tar painting has answered admirably for two seasons and even during the winter months. The amount of mud on such roads has been considerably less than on ordinary macadam. The cost of tar paint and chips has been found to stand almost a season's wear, and is a very economical method of maintenance. It has also been found that tar macadam or tar painted roads shaded by houses or trees have not turned out as well as roads in exposed situation.

Bridge of Allan, Scotland.—Tar painting has been carried out in this place for some years with varying success. Where the road does not carry any great weight of traffic and the weather is fairly good, tar painting has been found to be decidedly an advantage, in so far as that it minimizes the dust nuisance and saves watering. On the other hand, where the traffic is heavy and the weather wet it has been found that the tarred surface in places soon becomes worn off, and during the winter the road comes back to the old conditions.

Haddingtonshire, Scotland.—It has been for some years the practice in this district to tar paint all of the macadamized roads, and excellent results have been secured. In this district the work is begun in May, if the weather is suitable, and is all done by hand labor. It has been found that the tar painting remains good for a period of about six months on the streets with the heaviest traffic, but about November the surface begins to break up and works into black sticky mud, which has to be swept off, after which all traces of the tar soon disappear. On other roads, where the traffic is very light, it has been found that the tar painting remains good for two and sometimes three years, after which a much smaller quantity of tar is required to repaint the surface. The cost of tarring amounts to about 2 cts. per sq. yd. complete, the one coat being found sufficient. The tar is obtained from the local gas works, and is applied hot and only in dry weather. One-half of the width of the roadway is treated at a time, and this is immediately covered over with a good coating of dust, and the traffic is then allowed to pass over. In a day or two, when the tar has hardened, the dust is all swept off the road, which is then thoroughly watered. It is a mistake, states the county surveyor, to expect that a tarred road will require no watering during the whole season, as a certain amount of dust is bound to accumulate from horse droppings and dirt carried onto the road by the wheels of vehicles, and it is found advantageous to give an occasional washing, and to pay great attention to the thorough sweeping of the side channels, to which the dust naturally gravitates. The increased life of the road fully meets the cost of tarring.

Renfrewshire, Scotland.—The borough surveyor reports that in this district tar spraying is done by machine at a cost varying from 1½ cts. to 2 cts. per sq. yd., exclusive of cost of sweeping or sanding. He states that this is effective for one season only, on roads carrying heavy traffic, but where the traffic is light it may suffice for a longer period. He further states that it is essential that the roads be well constructed of good hard material with a homogeneous surface in order to obtain the best results. He believes that it is impossible to treat successfully a surface worn into holes or depressions.

Aylesburg.—During last year 4,185 sq. yds. of road surface were tarvia painted in this district. The surface was treated and sprinkled with granite chippings, at a cost of 4.28 cts. per sq. yd. The cost per sq. yd. without chippings was 2.9 cts.

Marple.—During the past two seasons about 11,000 sq. yds. of tar grout macadam have been laid in this district, some lengths of which have been a marked success and others not good. The method adopted in this district, after a number of experiments, is to prepare the road surface and to spread a fairly heavy coat of metal about 12 sq. yds. to the ton, taking care that any old metal that is used is screened, to remove the dirt and small material. The macadam is then slightly rolled with a 10-ton roller. The tar-cementing mixture is then applied hot by means of a hand spreader, the amount applied being about 2/3 gal. The macadam is then racked with ½-in. limestone chips, the chips being well brushed into the interstices and any surplus swept off. The macadam is then rolled again and a further dressing of tar mixture is applied, about one-third of a gallon being used per yard, and the macadam is again racked with ½-in. limestone chippings and rolled to a finished surface. The tar mixture consists of crude tar from the city gas works, with one-quarter of its weight of pitch added, well boiled until the water contained therein is evaporated. One gallon per sq. yd. is used. The stone used for macadam is a local stone, obtained from Macclesfield, and the chippings are Derbyshire limestone. Stone for macadam costs $1.86 per ton, delivered at wharf; ½-in. Derbyshire limestone, $1.56 per ton, delivered in the sheds; tar, $3.96 per ton at gas works; pitch, $6.72 per ton at station. The finished tar work costs about 26 cts. per sq. yd. It has been found that limestone makes a tougher cementing material than granite, and that the local macadam laid as tar grout macadam makes a better road than granite macadam laid water-bound; and that granite water-bound macadam and local stone tar grout macadam cost about the same amount.

TARVIA.

St. Germans.—During the past season the rural district council engineer has directed his attention chiefly to preparing a cheap form of bituminous concrete for the road coating, believing this to be far more economical than the constant application of tar to the surface of the road as a painting, as this, he believes, only suffices for the one season. The

method which has been adopted is first to do the necessary improvement to the cross-falls and correction of the surface to be coated; then to spread the road material and roll dry till firm. This is then sprayed or fluxed with liquid Tarvia. Directly upon this is spread the major binder, which is specially screened and dusted from the stone crushers and mixed with the Tarvia until in a "live" state. The whole is then thoroughly brushed in and rolled, and finally coated with dry screened chippings, to lick up an excess of Tarvia and to present a gritty asphaltic surface impermeable to moisture through the whole thickness of the coating. The surveyor states that the spraying and painting has not been particularly successful owing to its temporary nature. As soon as the severe weather of the winter approaches it is damaged and becomes useless; but the bituminous-bound coating, as above described, has stood the test through the severe winter weather, and is always clean and quickly dries after rain. The result is a much more permanent coating, a clean road surface during winter and a practically dustless condition during summer.

Kesteven.—The county surveyor reports that experimental lengths have been put down with Tarvia, Ferromac, Vianex, and with gravel for binding, and good results have been got with each, and that generally the use of binding has and is,being reduced to a minimum the surface, after rolling is completed, being afterwards covered with a thin layer of slag dust. This quickly fills up any interstices and makes a smooth skin, which appears to reduce the dust nuisance, prevents stones breaking loose, and forms an excellent surface for tar painting the whole surface of the main roads, which, owing to its slipperiness under certain conditions, is not generally acceptable in this county. Tracks about 2 ft. to 3 ft. wide, for each line of wheels of motor traffic on the trunk main roads, have been painted with Tarvia and covered with clean fine chippings. These tracks have proved very economical and very acceptable to the county; they effectually prevent the disintegration of the surface, reduce very considerably the dust, leave the other parts of the road untouched for horse traffic, and finally it costs very little to do. From experience on the Great North Road there seems to be no room for doubt that tar painting where there is any great amount of motor traffic is a decided economy as well as adding to the comforts of the road.

Sunbury-on-Thames.—During last summer 12,000 sq. yds. of road surface were tar painted in this district. Tarvia fluid and ⅜-in. granite chippings were used; the work was done by hand labor, and the cost, inclusive of light horse-rolling, was 3½ cts. per sq. yd. The district engineer reports that the improvement in the surface was very marked through the summer and autumn, and the road was in good order until after Christmas. The very bad weather and continual alternation of frost and thaw during January and February cut up the surface badly, and it had to be swept with a horse-broom set light several times. An advantage that was noticed is that the road very quickly comes to a good running surface again, two days' fine weather making it quite good going. The council intend to do a greater superficial area this season, and have reduced the contract number of street watering vans accordingly.

Horbury.—During the past two years 2,790 sq. yds. of road have been laid in this district on the Gladwell principle, bound with granite chippings and Tarvia. The results on the whole have been good, the least satisfactory being that portion between the rails on the tramway track. The cost of a Gladwell road in this district, using 2¼-in. Welsh granite at $2.78 per ton, special ¼-in. granite chippings at $2.40 per ton, and Tarvia at 9 cts. per gal., is about 44 cts. per sq. yd. (the figures given are the prices of materials at station). In August, 1908, a trial length of main road was tar-sprayed with Tarvia, at a cost of 3 cts. per sq. yd., the area being 3,132 sq. yds., and the hot Tarvia was sprayed on the road with a machine owned by the Taroads Syndicate, Ltd.; in July, 1909, 3,700 sq. yds. of main road were surface tarred by hand, at a cost of 2½ cts. per sq. yd., Tarmite being the preparation used. The district council engineer states that in his opinion the tar treatment of roads can only claim to be a dust preventative, and it cannot claim to reduce to any appreciable extent the amount of mud in wet weather. As a preservative he considers that the life of a road will be lengthened if it be tar painted.

TAR-MACADAM.

Dunfries, Scotland.—The burgh inspector reports that the experience during the past five years has convinced him that the most economical way to deal with suburban roads is to put down a coat of tar-macadam composed of 2½-in. whinstone metal finished with ¾-in. tarred chips, thoroughly rolled with steam roller, the total cost being 28 cts. per sq. yd. At Milldamhead, Annan-road, where there is heavy motor traffic, a stretch of roadway treated in 1906 is as perfect today as when newly finished, the peculiarity of this section being that only crude tar, without heating or any preparation, was used in its formation, and during the last four years no mud has ever appeared on its surface.

Perthshire.—The engineer of this district carried out three experiments last year with a prepared tar which is a composition of distilled tar and oil. The following are the treatments and the results: No. 1 System.—Running in hot tar between stones before being steam road rolled, allowing ¾ gal. of tar to 1 sq. yd. of bed of metal and binding with tarred chips. This system has shown most excellent results; there has been an entire absence of mud or dust during the past year, and it presents a smooth and dry surface in winter. It is thoroughly waterproof, concrete in construction and the treatment is simple and expeditiously worked. Estimate of cost 6 cts per sq. yd. more than the cost of water-bound system. No. 2 System.—Laying a coat of tarred ¼-in. chips over a macadamized surface 1 in. in thickness, and spreading a bed of 2½-in. metal 4 in. thick on top, then steam road rolling and binding with the same matrix as used for sub-binder or bottom cushion. This system has shown good wearing results. The metal bed resting on a soft cushion produces an elasticity on the surface when traffic passes over, thus minimizing the vibrating power and effecting a longer life to the metal. Scarcely any mud or dust has been produced during the past year, but as the sub-binder has a tendency to work up through the interstices of the stones it has the effect of causing larger voids between the metal, thus allowing surface water to percolate more readily down through the bed than is the case with system No. 1. Estimate of cost over water-bound system, 7 cts. per sq. yd. No. 3 System.—Blinding metal bed, after being thoroughly consolidated with steam road-roller, with ½-in. tarred chips. This makes a clean and dry surface and prevents mud and dust to large extent, and is much to be preferred before untarred chips, sand, gravel or ordinary road scrapings. Estimate of cost, 1 ct. per sq. yd. more than cost of water-bound system. The engineer states that from his observations and experience of different systems and treatments with tar, system No. 1 appeals to him as being the simplest, most endurable, least expensive and most expeditious remedy suitable for a large mileage. Although system No. 2 is almost equally as good as No. 1, still the details of preparations and the working operations are somewhat arduous and slow. No. 3 system might be largely adopted—where chips are easily available—as a good binding material. It is his intention to extend No. 1 system over longer lengths of road this season, particularly on main roads passing through burghs or villages.

Caversham.—The district council surveyor is to construct another section of "tar-bound" road upon the same principle as tried last spring with very great success. In this construction the old road was scarified and shaped, and the new road stone (Rowley Regis 2½-in. granite used) carefully spread to an even surface and well rolled in a perfectly dry state; a coating of ½-in. to ¼-in. clean granite chippings was then spread over the road and thoroughly broomed into all interstices and again lightly rolled. The surface was then treated with a mixture of hot tar and pitch, thoroughly broomed into it, and finished with a coating of ¼-in. chippings and again very lightly rolled. The section so treated last spring has so far stood admirably, and shows little or no signs of wear. The district council surveyor is also at the present time experimenting with a concrete road as follows: The surface of the road under treatment is shaped and a layer ¾ in. thick of hard local gravel mixed with sand and cement (small proportion of cement) is spread over the surface; the granite is then spread and thoroughly rolled down to a mosaic surface, chippings are then spread over and broomed in, and finally the whole is grouted up with granite chips, dust and cement, and lightly rolled. The traffic is kept off until dry.

SLAG-TAR-MACADAM.

Bolsover.—This district is in the center of an iron smelting area and uses much slag in the construction of its roads, the slag being delivered at an average cost of 96 cts. per ton. A considerable amount of tarred-slag-macadam is to be constructed this summer, the method of construction being as follows: The old surface of the street is taken off for a depth of 6 in., and is then rolled and leveled smooth with the steam roller; this bed is then tarred over with crude tar, and about 4½ in. of tarred-slag rejections is carefully spread and rolled in. Over this is laid about 3 in. of 2¼-in. tarred slag, and this is similarly rolled in with the steam roller, and above it is spread ¾-in. tarred slag for the finishing coat. This has been found to make a good non-slippery surface and costs less than 39 cts. per sq. yd. in this district.

Isle of Ely.—The county surveyor reports that a length of slag tar-macadam has been laid in this district on a heavy-traffic town road with most satisfactory results, as after three years' wear no repairs are, or have been, necessary except to make good a sewer trench opened by the urban authority soon after the road had been made. He states that but for the difficulty in providing and high initial cost this material would be used to a much larger extent, as it must prove an economy in the long run. Tarred binding has also been experimented with, but it has not proved very successful under heavy traffic.

TREATMENT WITH OIL-TAR.

Southall-Norwood.—The district council engineer reports as follows regarding treating the roads with oil-tar: "We shall also—as during the past three years—oil-tar our roads, as we find it to be the cheapest and most effective palliative for dust laying. In addition, it keeps the public health of the district at a high level. We do not use water carts at all, the whole of the roads being treated with oil-tar.

Bradford-on-Avon.—During the coming summer it is proposed to treat some five to six miles of roads in this district with oil-tar sprayed on. Last summer some of the roads received two coats, the majority only one. The result was excellent, and not much trouble was experience as regards foothold for horses. The cost was, in the opinion of the engineer, easily covered by the decreased wear and tear of the roads. Some of the roads treated were waterproof till after Christmas.

TARMAC.

Sunbury-on-Thames.—In the autumn, 2,504 sq. yds. of Tarmac was constructed, the existing granite being scarified and removed. The following are the details of actual cost:

179 tons 6 cwt. 2¼-in. Tarmac at $3.74 per ton	$ 669.92
128 tons 1 cwt. 1½-in. Tarmac at $3.74 per ton	481.14
10 tons slag dust at $2.34	23.64
Labor on scarifying and spreading	92.56
Cartage of Tarmac and scarifying granite	188.52

Six-ton steam roller at $5.86 per day....	71.88
Scarifying at $1.36 per yard.....	31.66
Total	$1,559.32
Credit for value of 263 yds. of scarified granite carted away...	259.82

The superficial area tar-macadamized was 2,504 yds., giving a cost of 62 cts. per yd. for all work. Taking credit for the scarified granite as above, the cost per sq. yd. was reduced to 52 cts. The Tarmac was laid in two coats, with a total thickness of 4 in.

COMPARISON OF THE COST AND ADVANTAGES OF SURFACE SPRAYING WITH TARVIA, TAR COMPO, TAR AND TAR MACADAM AND GLADWELL MACADAM.

The work was done last summer in Grangemouth under the direction of D. A. Donald, burgh surveyor. In July and September of last year Mr. Donald submitted the following reports: No. 1 Report.—Treatment of roads with Tarvia, tar compo, and tar. *Surface Spraying.*—(1) Bo'ness road, North Bridge street, Middle street, North Charlotte street, North Basin street.—These streets were treated in the following manner: Surfaces brushed with street rotary brush to remove all dust and surplus blinding, sprayed with Tarvia (a specially prepared bituminous compound) with "Aitken's patent pneumatic tar-sprayer," at the rate of 5 sq. yds. to the gallon, and at a pressure of 200 lbs. per sq. in., and blinded with Sussex pea gravel. The cost of the various operations in connection with this experiment are as follows:

	Per sq. yd. Cents
Sweeping and preparing road surface....	$0.10
Tarvia and application with Aitken's Sprayer	2.40
Sussex pea gravel blinding and labor spreading	1.40
Total	$3.90

If blinded with whinstone chips, .76 ct. per sq. yd.

(2) Grange street, South Charlotte street and Waterloo place.—These streets were treated in the following manner: Surfaces brushed with street rotary brush to remove all dust and surplus blinding, sprayed with tar compo (refined tar with 15 per cent of bitumen added), with Aitken's pneumatic tar-sprayer, at the rate of 5 sq. yds. to the gallon, and at a pressure of 200 lbs. per sq. in., and blinded with Sussex pea gravel. The costs of the various operations in connection with this experiment are as follows:

	Per sq. yd. Cents.
Sweeping and preparing road surface	.10
Tar compo and application with Aitken's sprayer	2.70
Sussex pea gravel blinding and labor spreading	1.40
Total cost	$4.20

If blinded with whinstone chips, .76 ct. per sq. yd.

(3) Abbots road, from Kerse road westwards 166 yds.—This portion of Abbots road was treated in the following manner: Surface brushed with street rotary brush to remove all dust and surplus blinding, sprayed with ordinary refined tar with Aitken's patent pneumatic tar-sprayer, at the rate of 6 1/3 sq. yds. to the gallon, and at a pressure of 200 lbs. per sq. in. and blinded with whinstone chips. The costs of the various operations in connection with this experiment are as follows:

	Per sq. yd. Cents.
Sweeping and preparing road surface	.06
Tar and application with Aitken's sprayer	1.20
Whin chips and blinding and labor spreading	.76
Total cost	2.02

Tar-Macadam.—(4) Abbots road, from Bowling Green gate to Kerse road.—This road was treated in the following manner: A coating 4 ins. thick of 2½-in. steel slag from Bowling Green gate to Talbot street and 2½ ins. hand-broken metal from Talbot street to Kerse road was applied to the old surface of the road, sprayed with tar, blinded with whinstone chips and rolled, and again sprayed with tar and blinded with whinstone chips and finally rolled. This is an expeditious method of forming tar-macadam, and requires very little rolling and blinding compared with an ordinary water-bound road. The cost of this form of tar-macadam works out at 4½ cts. per square yard over that of an ordinary water-bound road.

Gladwell Tar-Macadam.—(5) Abbotts road, from Bo'ness road to Bowling Green gate.—This road was treated in the following manner: A matrix composed of Tarvia and ¼-in. whinstone chips (in the proportion of 15 gal. of Tarvia to 1 cu. yd. of chips) both slightly heated before mixing, was applied to the surface of the road about 1½ ins. thick. A two-stone-deep coating of machine-broken whinstone metal was spread on the top of this matrix and rolled slowly, the matrix being worked up into the interstices of the metal and forming a binder. After the metal was thoroughly rolled and consolidated, liquid Tarvia, slightly heated, was poured over the surface of the road to fill up the interstices and blinded with ¼-in. whin chips. The cost of this system works out at 8.40 cts. per square yard over that of an ordinary water-bound road, but this cost could be considerably reduced if suitable appliances were procured for heating the chips and mixing the matrix.

Comparison of Costs.—The following is a comparison of the cost of the above work, including all labor:

	Per sq. yd. Cents.
Surface spraying with Tarvia, 3,361 sq. yds.	3.90
Surface spraying with tar compo, 1,765 sq. yds.	3.70
Surface spraying with tar, 940 sq. yds.	2.02
Extra cost of tar-macadam over that of water bound road, 1,060 sq. yds.	2.50
Extra cost of Gladwell-macadam over that of ordinary water-bound road, 453 sq. yds.	8.40

Hand Tar Spraying.—No. 2 Report.—Hand tar-spraying surface of Lumley street from Kerse road to Wallace street.—Lumley street was sprayed with ordinary refined tar. The operation consisted of: (1) Sweeping the surface with horse sweeper and hand brushes to remove all dust. (2) Spraying ordinary refined tar, heated in a tar boiler on the surface of the road with ordinary watering cans at the rate of 6½ sq. yds. to the gallon. (3) Blinding the tar with ¼-in. whin chips. The costs of the various operations are as follows:

	Per sq. yd. Cents.
(a) Sweeping and preparing road surface..	.10
(b) Tar and application with watering cans	1.20
(c) Chips, cartage and labor spreading....	.50
Total cost per sq. yd.	1.80

Regarding these experiences Mr. Donald states: "The portion of Bo'ness road opposite the town hall was tar-sprayed at a cost of about 2 cts. per square yard. The experiment was satisfactory, and a clean and almost dustless road was the result during the summer months, but in the winter months the tarred surface was broken and the road appeared in much the same condition as other roads which had no treatment with the tar. The cause of this is: (1) The fact of the road carrying a considerable amount of heavy traffic. (2) The road having no bottom. Notwithstanding the breaking up of the tarred surface in the winter time, I give it as my opinion that the tar-spraying has increased the life of the road, and this, I think, justifies the expense, which, after all, is very low."

"Lumley street, which was treated in the same manner, is a good road today. This road does not carry the same traffic as Bo'ness road, and it has a good bottom. The experiment has been satisfactory, both in summer and winter, and to preserve its good condition it might be necessary to prepare and re-tar-spray some portions of it this year. As to the saving on this road: Last winter it was scraped on an average once per week. The cost of scraping last winter I put at $92. The cost of tar-spraying was $43.75. Consideration must also be given to the preservation of the road and the comfort to pedestrians and dwellers in the streets.

"The other streets tar-sprayed were those in the old town. Those today are in good condition, and the scraper was never used on them during the winter.

"The experiments on Abbots road were of a different nature, and the road now forms what is called a tar-macadam *in situ* road. It has stood well during the winter months and is in good condition today. The road, of course, carries very little traffic. The cost of this experiment was 10 cts. per square yard from Bo'ness road to Bowling Green gate and 9½ cts. per yard from Bowling Green gate to Kerse road."

Bituminous Macadam in State Road Construction Work in New Jersey.

During 1909 a total of 70 miles of bituminous macadam roads were built in New Jersey under the direction of the state commissioner of public roads, and at the end of the year 31 additional miles were in course of construction. The standard state specifications for the construction of macadam roads with asphaltum binder contain the following requirements regarding the application of the binder: When the second course of broken stone has been spread and rolled, asphaltum binder shall be applied by means of a mechanical distributor designed to evenly distribute the asphaltum binder, to regulate

TABLE SHOWING THE CONTRACT PRICES IN 1909 FOR STATE ROADS IN NEW JERSEY CONSTRUCTED WITH BITUMINOUS BINDERS.

Road.	County.	Kind of Surfacing	Width surfacing, Ft.	Length, miles.	Depth of stone, ins.	Square yards.	Price per sq. yd.
Paterson Plank	Bergen	Macadam with asphaltum binder[1]	18	2.31	8	24,125	$0.90
River Road	Bergen	Macadam with tar binder[2]	22	2.44	7	29,087[3]	.75
Jamesburg	Middlesex	Macadam with asphaltum binder	14	1.32	8	11,103	.85
Hopewell	Mercer	Macadam with liquid asphalt		2.03	6	22,146	.57[4]
Trenton Turnpike	Middlesex	Macadam with asphaltum binder	16	2.50	8	23,584	.81
Helmetta	Middlesex	Macadam with asphaltum binder	14	2.70	8	22,248	.83
Plainsboro	Middlesex	Macadam with asphaltum binder	14	2.46	6	20,338	.90
Green Brook	Somerset	Macadam with asphaltum binder[5]	14	1.16	8	9,528	.70
Stoutsburg	Somerset	Macadam with asphaltum binder	14	2.05	8	16,870[6]	.90

Walnut Ave	Union	Macadam with amiesite[7]	16	1.19	8	9,797	1.10
Walnut Ave	Union	Macadam with amiesite[7]	16	1.19	8	1,636	1.20

[1]1.3 gal. of hot asphaltum oil applied to top coat. [2]Tarvia applied by penetration method on second course. [3]Also ¼ gal. tar additional application per sq. yd. to the 29,087 sq. yds., at 9 cts. per sq. yd., making the total cost 64 cts. per sq. yd. [4]This is a bid of 51 cts. per sq. yd. for plain macadam plus 6 cts. per sq. yd. for applying liquid asphalt. [5]1.3 gal. of asphaltum oil per sq. yd. [6]Telford. [7]Upper 3 ins. composed of amiesite. [8]1.3 gal. per sq. yd.

the width of distribution, to control the quantity distributed and to maintain the asphaltum binder at a uniform temperature.

The quantity of asphaltum binder required will be 1.2 gals. of residual bitumen per square yard of macadam surface, the temperature of which when applied shall be not less than 190° F. nor more than 200° F.

Before any binder is applied to the 1½ in. stone, the contractor must have on hand the required amount of ¾ in. stone and screenings necessary to finish the road so the same can be applied at once after the rolling has been finished, also the quantity of the 1½ in. stone coated at any one time shall not be so large but that there will be sufficient binder left in the car for the surface dressing.

After the application of the asphaltum binder the rolling shall continue until the stone ceases to sink or creep in front of the roller. The wheels of the roller are to be kept constantly wet so that they will not adhere to any of the coated stone during the rolling. The amount of rolling required to be done shall be subject to the approval of the engineer and supervisor.

Any depressions formed during the rolling, or from any other cause, are to be filled with 1½ in. stone or ¾ in. stone or both, together with asphaltum binder, as ordered by the engineer, and the roadway then rolled until brought to the proper grade and curvature as determined by him. Additional asphaltum binder must also be applied in such quantities and at such points as directed by the engineer, so that the entire surface of the second course of stone will show a uniform quantity of asphaltum binder upon its face before the spreading of the surface course of stone.

When the two courses of stone are rolled to the satisfaction of the engineer and supervisor, a coat of ¾ in. stone shall be spread of sufficient thickness to make a smooth and uniform surface to the road. This ¾ in. stone must not contain over 5 per cent of material small enough to pass a screen having ¼ in. openings and must be as free as possible from dust. A second application of the asphaltum binder shall then be made at the rate of .3 gal. of residual bitumen per square yard, and after this second application of binder has thoroughly penetrated the ¾ in. stone, stone dust shall be applied in sufficient quantity to just fill the voids and the road again rolled until it becomes thoroughly consolidated, hard and smooth.

Rolling must be done by contractor with a 10-ton standard steam macadam roller, so constructed as to give a compressing power of not less than 400 lbs. per lineal inch on drivers, approved by the engineer.

The accompanying table, compiled from the last annual report of Frederick Gilkyson, state commissioner of public roads, shows the contract price and details of construction of a number of bituminous macadam roads built last year.

During the month of April the total amount of material excavated in the canal division of the Panama Canal was 1,723,339 cu. yds., of which 556,787 cu. yds. were classified as earth and 1,166,552 cu. yds. as rock. Of this quantity, 1,685,030 cu. yds. were removed by steam shovels. The high record of the month was made by shovel No. 204, working 26 days in the Culebra district, which excavated 55,635 cu. yds. of rock. The second best record for the month was made by shovel No. 205, working 25 days in the Culebra district, which excavated 54,597 cu. yds. of rock. The best record for a shovel of the 70-ton class was made by shovel No. 127, working in the Tabernilla district, which excavated 35,164 cu. yds. of earth in 26 days. Shovel No. 217, in the Culebra district, made the high record for one day by excavating 2,945 cu. yds. of rock on April 28. Shovel No. 127, working in the Tabernilla district, excavated 1,624 cu. yds. of earth on April 2, being the high record for one day for a 70-ton shovel during the month.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Some Published Costs of Tunnel Work in the Los Angeles Aqueduct.

In our issue of May 18, 1910, we gave some figures of cost of tunneling on the Los Angeles aqueduct, which were submitted by Mr. J. B. Lippincott, assistant chief engineer, to show the economy of day labor work. As presented these figures told very little regarding the real economy or otherwise of the work since no data were given as to cross-sections of tunnel, character of material penetrated or methods of work. In fact, very few figures of detailed costs in this work have been made public. Such of these as we have been able to find we have collected and rearranged for study by contractors in the following paragraphs:

The tunnels in the Los Angeles aqueduct are all of one type but vary in sections; the type is shown by Fig. 1. This is one of the largest of the sections on the power pressure pipe line, where a capacity of 1,000 sec. ft. is

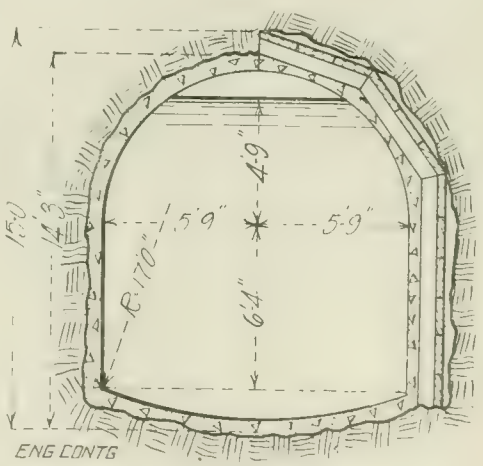

Fig. 1.—Cross Section of Power Pressure Line Tunnel, Los Angeles Aqueduct.

provided. In normal conduit lines a nominal capacity of 420 sec. ft. is provided. The computed capacities, quantities, etc., of the several standard tunnel sections adopted are as follows:

With these data the following general and specific costs may be studied somewhat understandingly.

	S=.002	S=.0013	S=.001	S=.0005	S=.00035
Capacity, sec. ft.	433	430	432	438	430
Velocity, ft. per sec.	8.48	7.2	6.5	4.991	4.64
Excavation, cu. yds.*					
Timbered	3.37	3.74	4.665	5.09	6.38
Untimbered	2.705	3.045	3.344	4.28	5.38
Concrete, cu. yds.*					
Timbered	0.907	0.975	1.002	1.125	1.38
Untimbered	0.684	0.716	0.752	0.88	1.05

*Per lineal foot of tunnel.

TUNNELS ON TAWIONE DIVISION.

The standard sections for tunnels on this division are shown by Figs. 2 and 3. The dimensions and quantities of these sections are:

	S=.0013	S=.001
Dimensions, ft.	8x9	8½x7½
Capacity, sec. ft.	430	432
Velocity, ft. per sec.	7.2	6.5
Excavation, cu. yds. per lin. ft.:		
Timbered	3.740	4.665
Untimbered	3.045	3.344
Lining, cu. yds. per lin. ft.:		
Timbered	0.975	1.002
Untimbered	0.716	0.752

Mr. J. B. Lippincott gives* the cost per lineal foot of tunnel work on this division for 61,515 lin. ft. of excavation and 33,805 lin. ft. of lining as follows:

Item.	Per lin. ft.
Excavation	$12.70
Lining	6.80
Maint. and operation	0.68
Equipment	2.20
Total	$22.38

Roughly, from the above figures, the cost of excavation will have been from $3.12 to $4.17 per cu. yd. and the cost of lining from $6.79 to $9.50 per cu. yd.

SOME COSTS OF THE LOS ANGELES AQUEDUCT TUNNEL WORK.*

The cross-sections of the various tunnels differ slightly. One, typical of the work on the Saugus division, is shown in the accompanying Fig. 1. For this cross-section the excavation amounts to 6.7 cu. yds. per lin. ft. where the ground must be timbered, and 5.93 where no timbering is necessary. The concrete used in lining is 1.314 and 1.029 cu. yds. for timbered and untimbered respectively. The capacity of this tunnel is 1,000 sec. ft. at a velocity of 7.81 ft. per sec. This section is used among other places at Tunnel 73. At the long Newhall tunnel, No. 104, a similar but smaller section is driven. For this the excavation is 5 cu. yds. timbered, and 4.12 untimbered; concrete 1.11 and 0.80 cu. yds.; capacity 420 sec. ft., and velocity 4.91. At Tunnel 82 a slightly different section of the same capacity is used.

In the main the tunnels are driven in soft rock, sandstone and cemented gravel being most common. On the Saugus division, the one nearest the city; the ground stands well whether wet or dry. The favorable character of the ground has been an important factor in reducing the costs. While there have been many difficulties, including gas and the inflow of oil, there has been relatively little of the ground which was faulted and moving as in mines and not a great deal of hard igneous rock, such as is abundant in mining districts. Much of the work has been done by hand. Frequently the holes could be drilled with augurs and after blasting up to the spring line, the rest was picked down. Some excellent records both as to cost and speed have been made on the Saugus division of which D. L. Raeburn is engineer.

At Tunnel 82, with J. T. Nolan in immediate charge, a typical month's record showed: North portal, 399 ft. progress, 399 ft. timbered, unit cost $8.58 per ft. for excavation, $1.32 for timbering; at the south portal the corresponding figures were 434, 424, $7.72, $1.16. For the total work the average cost of the tunnel unlined was $9.43. The ground here is a compact sand and clay. Three miners work at the breast boring with hand augurs and getting in two rounds per shift of 8 hours, the holes being 3 ft. deep and a round consisting of 6 to 9 holes. Two other miners trim down the sides and pick down the top, working on a false staging. Five men shovel, tram, and timber, and there is a foreman for each crew. The eleven men constitute a unit. Miners are paid $3 when working in dry ground and $3.50 when it is wet. The shovelers and trammers get $2.50

*Engineering-Contracting, May 18, 1910.

*"Mining and Scientific Press," May 14, 1910.

and $3. A minimum of 4 ft. is required where the ground does not need timbering and 3½ ft. where it must be supported. A bonus of 25 cts. per foot is paid for all above this, the money being divided among the men working in the drift. In practice it amounts to additional compensation to the amount of 75 cts. to $1 per day per man, but the system greatly increases the speed of the work and decreases the cost. Much the same organization is maintained at other points, though where the ground is harder hand-drills are necessary. (To arrive at the cost of excavation per cubic yard we assume the excavation to have been the same per lineal foot as in the Newhall tunnel, or 5 cu. yds. for timbered and 4.12 cu. yds. for untimbered. In the north portal 399 ft. of timbered section cost $8.58 per lin. ft. or $8.58 ÷ 5 cu. yds. = $1.716 per cu. yd. of excavation.—Editors.)

In the Newhall tunnel, driven in wet cemented gravel, four men work at the breast with hand-drills. At this tunnel one month's progress was as follows: North portal, 176 ft., unit cost $29.36, timber $5.92; south portal, 301 ft., $14.44, timber $6.35. The total progress at that date had amounted to 5,572 ft., at a unit cost of $17.65 for excavation and $5.30 for timbering. Concrete lining had been put in 1,017 ft. of sides and arch at a unit cost of $5.66 per ft., and in 1,075 ft. of bottom at a further cost of $1.91. (At $17.65 per lin. ft. for excavation the cost per cubic yard was $17.65 ÷ 5 cu. yds. = $3.53.—Editors.)

Tunnel 73, C. B. Worthen, constructing engineer, was driven by hand-drilling through wet shale at the north, and schist at the south. A typical month's work here was: North portal, 168 ft., $18.94; south portal, 126 ft., $26.29. For a total distance of 3,271 ft., the unit cost was $26.35. The unit cost of the tunnel complete except for bottom lining was $43.43 per foot. (At $26.29 per lineal foot the cost of excavation was $26.29 ÷ 6.7 cu. yds. = $3.923 per cu. yd. This figure assumes timbered sections throughout, which makes the cost less than it would be were untimbered sections allowed for.—Editors.)

In comparing these figures the cross-section as well as the character of the ground should be taken into account, and it is also proper to state that these are not picked out as representing the best records either as to cost or speed. With these reservations in mind, the following miscellaneous data regarding cost per foot in a number of the tunnels on the aqueduct may be read with interest:

COST OF TUNNELS DRIVEN WITH MACHINE DRILLS

Tunnel	Distance, feet	Average cost	Ground.
12 North	818	$19.34	Hard granite.
12 South	824	21.63	Hard granite.
13 North	...	22.93	Hard granite.
14 South	...	28.12	Hard granite.
15 South	...	22.73	Hard granite.
16 North	...	21.66	Hard granite.
16 North	...	16.98	Hard granite.
17	...	18.31	Hard granite.
3 South	774	12.92	Gas in rock.
3 South	1,124	14.09	
7 North	1,347	14.68	
1 B	1,251	9.37	Granite.
3	1,014	12.60	Granite.
2	1,021	10.57	Wet and blocky

The above are average costs for tunnels complete, timbered, and ready for lining. The unit figures in each case differ a little from those given but fall within the range indicated. The powder consumption ranges from 4.30 to 39.09 lbs. per lin. ft. of advance.

At the Elizabeth tunnel, November, 1909, using powder of 40 to 60 strength, 17.50 lbs. per lin. ft. of advance was used at the north portal and 38.09 at the south. This tunnel is driven in hard rock with machine drills. In the same month at Tunnel 73, 5.80 lbs. was used at the north portal and 8.20 at the south. The excavation here is in a soft sandstone and the holes are drilled by hand.

One of the most interesting phases of the work is that of lining the tunnels with concrete. The mixture is 1 to 7, natural gravel and sand being used with Portland cement. The latter is in part manufactured at a plant built and operated by the Aqueduct Bureau, and in part purchased on bids in lots of 2,000 bbls. or more. The cement costs approximately $1.15 per bbl. when so bought, or $1.45 delivered on the work. It is mixed outside the tunnels in Ransome or similar machines and carried to the work in tunnel cars. The process of lining involves (a) setting the forms; (b) dry-packing where the section has been over-broken; (c) placing the mixture for walls and arch; (d) tearing down the forms; (e) smoothing and plastering the surface; (f) lining the bottom. The forms consist of a series of wooden panels placed horizontally and fitting against steel ribs. The latter are in two pieces joined by a removable key at the crown of the arch and each extending down to a mud sill at the side. To prevent crowding in, the base of the rib and the sill are braced by sprags against the ends of the cross-ties under the tunnel track. The ribs are made of light T-steel, shaped to conform to the finished cross-section, and are easily placed and removed. Dry-packing with boulders and broken rock is necessary in order to economize the concrete. It is impossible to break a tunnel so as to conform absolutely to a cross-section and leave exactly the calculated space for timbers and concrete lining. One of the difficulties of the work was to train miners not to over-break the section. In dry-packing the boulders are placed by hand, as the panels in the forms are

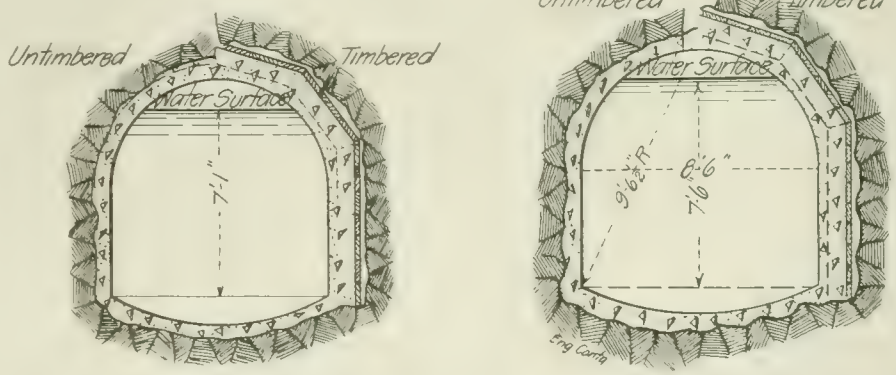

Fig. 2.—Standard Sections of Tunnels, Jawbone Division, Los Angeles Aqueduct.

shipped into place so as to leave as nearly as possible uniform space for concrete. The minimum thickness of the latter allowed 4 ins.

In lining the sides the concrete is shoveled from the car directly into place as the panels and dry-packing proceed. To cover the arch it is necessary to have a movable stage. This is shown as a "jumbo" and is a long platform stretching from side to side and supported by legs, which straddle the regular track and run on extra temporary rails laid near the foot of the wall. As the work progresses the whole structure moves forward. At the front is a hinged inclined track that can be lowered by means of a motor on the jumbo, and up which the cars loaded with concrete, rock and panels may be pulled by an electric hoist. The platform is long enough to permit a full gang of men to work.

After about 36 hours the forms are torn down and the rough places trimmed with small hammers. The surface is then coated, where it is necessary, with a thin wash of cement, which is practically a plaster. Later the regular track is torn up and the bottom lined, the work resembling sidewalk laying. Concrete workers are paid $2 to $2.50, according to the character of the work. Foremen get as much as $4 per day. The work here, as in all other departments, is on an 8-hour basis. Under these conditions the concrete costs $5.28 to $8.07 per cu. yd. in place, the amount varying with local conditions and depending somewhat on the relative amounts of arch and bottom work included in each piece of work. The cost for labor and mixing covering complete lining of 853 ft. of Tunnel 20 amounted to: Bottom, $2.39; sides, $1.87; arch, $2.85. The total costs on this particular piece of work were:

	Per foot of tunnel	Per cu. yd.
Lining bottom	$0.88	$6.72
Lining sides	1.81	6.29
Lining arch	2.79	8.07
Plastering walls	0.31	0.17*

*Per square foot of surface. (This figure is evidently in error.—Editors.)

The cost for bottom was a little low here, other figures being $1.16, $1.33, $1.91 per foot of advance. Total costs per foot of advance at other places ran $4.33, $4.54, $5.21, $7.89.

SOME DETAIL TUNNEL COSTS IN TUNNEL NO. 7 OF THE LOS ANGELES AQUEDUCT.*

The appended study covers unit costs of driving a timbered tunnel in the Little Lake division of the Los Angeles aqueduct (William Mulholland, chief engineer; J. B. Lippincott, assistant chief engineer; Edward Comerer, foreman in charge, and the writer engineer in charge of the division) during the 15-day period from Aug. 15 to Aug. 29, inclusive. The figures refer to the north heading only.

During this period 90 ft. were driven in 15 8-hour shifts. The tunnel is approximately 10x10 ft. in section and contains 3½ cu. yds. in place per lineal foot to pay line. The over-breakage was about 17 per cent, making a total of 6½ cu. yds. of broken material per foot of tunnel.

The heading is 800 ft. in from the portal. It is lighted by electricity in 110 volts, and ventilated by a No. 3 Champion blower through 12-in. pipe, the heading being cleared in fifteen minutes after shooting.

Drilling is done by one No. 7 Leyner drill, water being forced through the hollow steel. This drill used approximately 66 cu. ft. air per minute at 83 lbs. pressure, drilling holes to 10 ft. in depth.

Mucking is facilitated by steel sheets laid down before shooting. The muckers use No. 3 D-handle square-point shovels. Dirt is hauled away in 32 cu. ft. rocker dump cars pulled by a 3½-ton locomotive running on a single 24-in. gage track laid with 25-lb. steel.

The rock is a close-grained hard gray granite, with numerous seams, causing the drill to run from alinement, but it breaks well. The seams and water combined make it necessary to timber all this ground. The ground carries enough water to make disagreeable mucking, and to require pumping.

The timbering comprises sets of 6x8-in. Oregon pine, spaced 5 to 8 ft. apart, as ground permits, and 2x6 lagging. Each set consists of two vertical posts and a four-segment arch.

The crew consisted of one shift boss at $3.50 per day; four miners at $3; five muckers at $2.50, and one trammer at $2.50. The blacksmith doing the repair work was paid $4 per day.

The four miners worked on day shift, drilling the ground, timbering and shooting. The muckers followed on night shift. This arrangement resulted in a clean heading for the drill crews, and nothing interfered with the mucking crew.

The cost of work during the 15-day period is tabulated below in detail (Table I).

To explain the table further the following particulars are noted as to drilling and powder:

Drilling.—During the 15-day period 150 holes were drilled, aggregating 1,202.3 ft. in length. The average depth of hole therefore

*An article by C. H. Richards, Division Engineer Little Lake Division, Los Angeles Aqueduct, in "Engineering News," Nov. 18, 1909.

was 8 ft. The average speed of drilling was 21.74 ft. hole per hour of actual drilling time, or 15.84 ft. per hr. if lost time is included. This means that the average hole (8 ft.) was drilled in 22 mins. The fastest hole, however, was 9 ft. 6 ins., drilled in 10 mins., while the slowest was 8 ft. 6 ins., drilled in 78 mins. The average cost of drilling per foot of hole was 3.6 cts., as given in the table.

TABLE I.—SHOWING UNIT COSTS OF TUNNELING AND TIMBERING, NORTH HEADING OF TUNNEL NO. 7, LITTLE LAKE DIVISION OF LOS ANGELES AQUEDUCT.
For 15-day period, Aug. 15-Aug. 29, 1909; advance 90 ft.

Class of work.	Totals for 90 ft. length. Labor. Hours.	Cost.	Cost per lin. ft. tunnel.
Labor:			
Inside labor:			
Squaring heading	23.5	$ 9.03	$0.10
Setting up and tearing down machine (1)	36.	16.59	.184
Drilling, incl. time of shift boss (3.6 cts. per ft. of hole.)	55.33	43.21	.48
Blowing out holes	5.75	4.15	.046
Loading and shooting	58.25	22.31	.248
Mucking (412 cars)	835.	268.44	2.98
Trimming, stulling, caves, etc.	102	39.24	.436
Timbering ($11.32 per M)	107.25	40.82	.453
Lost time	40.75	15.66	.174
Bonus (30 cts. per man per ft. over 2.3 ft. per shift)	.....	112.08	1.24
Repairs to trolley, pump, etc.	3.25	1.20	.013
Totals, inside labor	1,265.08	$572.73	$6.354
Outside Labor:			
Sharpening steel (with Leyner No. 2 machine)	44.	$ 17.83	$0.198
Repairing drill	7.5	2.88	.032
Framing timbers at shop ($2.42 per M)	.....	8.75	.097
Light and power	90.	33.75	.375
Totals outside labor	141.5	$ 63.21	$0.702
Auxiliary Labor:			
Laying track, 90 ft	31.5	$ 12.75	$0.141
Drainage line, 90 ft	43.5	14.33	.16
Ventilation line, 72 ft	11.	3.44	.043
Trolley line, 95 ft	18.	6.35	.067
Air line, 80 ft	2.5	.80	.01
Water line, 80 ft	2.5	.79	.01
Lights line, 90 ft	8.	2.86	.032
Totals auxiliary labor	117.0	$ 41.32	$0.463
Local Administration and Engineering:			
Proportion of division engineer and assistant's time		$ 50.40	$0.56
Total labor cost		$727.66	$8.084
Material:			
Construction Material and Supplies:			
Drill repairs ($0.018 per ft. hole.)		$ 22.47	$0.25
Drill supplies, oil steel, coal ($0.008 per ft. hole.)		9.41	.104
Mucking supplies, oil, etc		.73	.008
Power and lighting current (4,207 KW. hrs., at 1.7 cts.)		71.52	.795
Explosives, powder, fuse, caps, etc. (11.66 lbs. powder per ft. tunnel.)		157.69	1.752
Timbers, wedges, dowels, nails, etc. (3,579 ft. B. M. = 40 ft. B. M. per ft. tunnel.)		122.16	1.36
Lighting candles $8.59, el. lt. globes $3.09		11.67	.13
Totals, constr. material		$395.65	$4.399
Auxiliary Material:			
Trackage, 25-lb. rail, ties, etc		$ 21.11	$0.235
Drainage, 2-in. pipe and el. wire		7.87	.087
Ventilation, 12-in. pipe (for 72 ft.)		29.21	.405
Trolley, wire, etc. (for 95 ft.)		9.73	.102
Air line, pipe, etc. (for 80 ft.)		7.25	.09
Water line, pipe, etc. (for 80 ft.)		7.25	.09
Lights line, wire, etc		2.22	.025
Totals, auxiliary material		$ 84.64	$1.034
Total material cost		$480.29	$5.433
Live Stock:			
Mule, 15 days at 90 cts		$ 13.50	$0.15
Total direct and auxiliary field charges		$1,221.45	$13.667

Explosives.—There were used 650 lbs. of 1⅛-in. 40 per cent gelantine; 250 lbs. 1-in. 40 per cent gelantine, and 150 lbs. 1-in. 60 per cent gelantine, a total of 1,050 lbs. This is 11.66 lbs. per lin. ft. of tunnel, or 3.3 lbs. per cu. yd. place measurement. The cost (delivered) was $140.87. Adding the cost of fuse (2,700 ft. $13.85), caps (306 = $2.49), and tamping stick ($0.48), makes the total cost $157.69, which is about $0.50 per cu. yd. place measurement and $0.27 per cu. yd. loose.

The following summarized the above cost, together with the field and office charges assessable to the work. Attention may be called to the fact that the figure $12.165 given as direct charge differs from the previous total of $13.667 by the amount ($1.502) charged for tracks, the latter being included in the previous detail tabulation. In the recapitulation the auxiliary charge is reduced by the estimated amount of salvage on the track material.

RECAPITULATION OF UNIT COSTS.

Class of charge.	Cost per foot of tunnel, dollars.
Direct Charges:	
Labor	$7.056
Material and supplies	4.399
Local administration and engrg.	0.56
Live stock service	0.15
	$12.165
Auxiliary Charges:	
Labor on tracks, etc	$0.468
Material for tracks, etc	1.034
	$1.502
Salvage on material about 66%	.69
	0.812
Roads and trails*	1.50
Buildings*	0.20
Water supply*	0.22
Machinery and tools	1.06
Total fixed charges	$15.957
Add 3% for executive office administration	0.475
Total cost of tunnel, timbered and ready for lining, per lin. ft.	$16.432

*The total cost of these works on the entire division, apportioned to the several parts of the permanent construction, gives as estimated charges per foot of this tunnel the figures noted.

(Deducting from the total of $13.667 of Table I the charges that obviously belong to timbering we get a cost of $11.75 per lin. ft. for excavation, which is equivalent to $3.36 per cu. yd.—Editors.)

SUMMARY OF COSTS FOR FIVE MONTHS ON THE ELIZABETH TUNNEL.*

The Elizabeth tunnel is the most important tunnel on the aqueduct. It is 26,800 ft. long and has a net sectional area after lining of 90 sq. ft. The amounts of excavation per lineal foot are: 5.02 cu. yds. for timbered section and 4.18 cu. yds. for untimbered section. The material penetrated is granite rock, ranging from very hard solid rock to rotten and blocky rock. The tunnel is being driven with a first-class plant of air compressors, water Leyner drills and electric haulage. Mr. Lippincott's cost figures for the five months October, 1909, to February, 1910, are as follows:

	Heading. North.	South.
October, 1909.		
Exc. per lin. ft. heading	$23.80	$30.20
Timb. per lin. ft. timbered	6.33	3.79
Admin. and housing per lin. ft. heading	1.53	3.55
Totals*	$31.66	$35.35
November, 1909.		
Exc. per lin. ft. heading	$24.65	$33.91
Timb. per lin. ft. timbered	5.86	5.25
Admin. and housing per lin. ft heading	1.91	4.62
Totals*	$32.42	$39.62
December, 1909.		
Exc. per lin. ft. heading	$23.11	$29.96
Timb. per lin. ft. timbered	6.99	7.72
Adm. and housing per lin ft. heading	1.56	3.62
Totals*	$31.66	$34.42
January, 1910.		
Exc. per lin. ft. heading	$24.64	$28.83
Timb. per lin. ft. timbered	7.04	6.33
Adm. and housing per lin. ft. heading	1.85	2.30
Totals*	$33.53	$32.45
February, 1910.		
Exc. per lin. ft. heading	$21.94	$25.73
Timb. per lin. ft. timbered	5.60	4.13
Adm. and housing per lin. ft. heading	2.25	1.67
Totals*	$29.79	$29.97

*Costs per lineal foot of timbering are reduced to costs per lineal foot of heading to get these totals.

General Note: These costs do not include percentage of charge for equipment, buildings or pipe lines.

To get at the unit costs of excavation some computation is necessary. Mr. Lippincott gives the following figures of progress from which we may compute the volume of excavation with reason accuracy:

	North Heading. Total lin. ft.	Timbered lin. ft.	South Heading. Total lin. ft.	Timbered lin. ft.
October, 1909	547	547	413	159
November, 1909	471	471	378	85
December, 1909	476	476	480	50
January, 1910	481	481	515	104
February, 1910	529	529	516	188

For timbered section the volume of excavation per lineal foot is 5.02 cu. yds., and for untimbered section it is 4.18 cu. yds. The entire advance of the north heading being timbered, the volume of excavation ran 5.02 cu. yds. per lin. ft. throughout. In the south heading a portion of the advance each month was timbered and a portion untimbered, so that the volume of excavation per lineal foot for each month varied and must be averaged for each month to get unit costs. Doing this we get the following costs per cubic yard for excavation in each heading for each month:

Month.	North Heading.	South Heading.
October, 1909	$4.74	$6.76
November, 1909	4.91	8.21
December, 1909	4.60	7.01
January, 1910	4.91	6.63
February, 1910	4.37	5.73

The greater cubic yard costs of the south heading are due to the more intractable rock, which is described as medium hard and hard granite. The difference in the nature of the rock in the two headings is indicated fairly well by the different amounts of powder used per lineal foot of heading, as given by Mr. Lippincott, and which we have reduced to pounds per cubic yard of excavation to enable more ready comparison:

Month.	Lbs. per cu. yd. North Heading.	South Heading.
October, 1909	4.054	6.040
November, 1909	3.486	9.225
December, 1909	2.549	8.407
January, 1910	2.808	7.747
February 1910	3.008	6.303

(Continued from page 492.)

explain why day labor is not as cheap as the contracted work; it is because city officials and employes are largely incompetent or dishonest or both. The contractor must have a profit to continue in business. As the element of chance enters to a considerable degree in his work, his profit ought to be a fair percentage. Theoretically this puts him at a great disadvantage as against the city doing its own work. Practically, however, this disadvantage is entirely overcome by the looseness, stupidity, and crookedness of those in whose hands the people of the city have placed their business affairs.

And why have the people chosen agents of that sort? Merely because they would rather play at the game of partisan politics than have the city properly managed.

Whenever we have an example of a properly managed city, like Des Moines or Galveston, or a properly managed department in a city, like our own water department, we have plenty of instances obtainable where the city has saved money by doing its own work. A thing that is true theoretically is always true practically when it is given a fair chance.

Fleeing to the contractor system simply tends to palliate a little the damage of bad government, and to that extent serves to perpetuate the evils. If the government is crooked and incompetent, money will be lost through contractors quite as much as through direct labor, although it may not show in the accounts. The loss usually takes the form of inferior work, which must, sooner or later, be replaced at great cost.

Occasionally there are forms of city work that are not adapted to direct labor, and it is always well on any great enterprise to let sections here and there by contract to get the test of a comparison, but for a city government to attempt to dodge responsibility by putting everything into the hands of contractors is to confess that government itself is a failure, and such a confession means paralysis of all effort toward improvement. A wise public sentiment will insist that the city does business for itself, and if the results are bad, will demand that the whole system be reformed.—Editorial in the *Pacific Outlook* for May 14, 1910.

*From data furnished by J. B. Lippincott, Assistant Chief Engineer Los Angeles Aqueduct, to "Engineering News," April 28, 1910.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Pressure Resistance and Stability of Earth.*

In the writer's paper, "The Bracing of Trenches and Tunnels, With Practical Formulas for Earth Pressures,"† certain minor experiments were noted in connection with the arching properties of sand. In the present paper it is proposed to take up again the question of earth pressures, but in more detail, and to note some further experiments and deductions therefrom, and also to consider the resistance and stability of earth as applied to piling and foundations, and the pressure on and buoyancy of subaqueous structures in soft ground. In order to make this paper complete in itself, it will be necessary, in some instances, to include in substance some of the matter of the former paper.

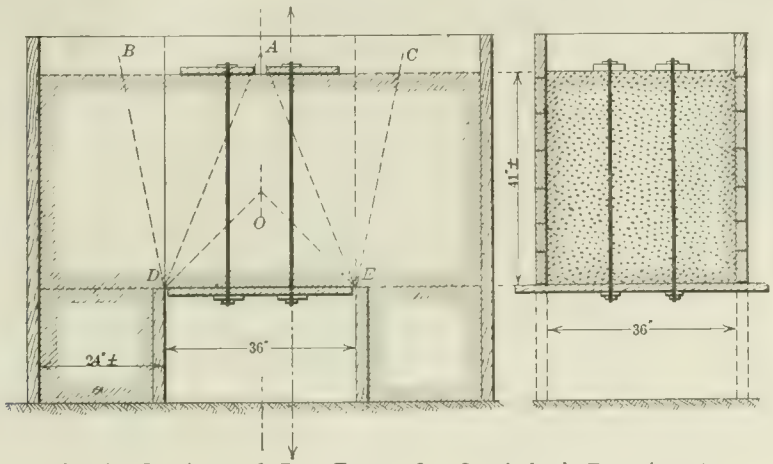

Fig. 1.—Sections of Box Frame for Sand Arch Experiments.

Experiment No. 1.—As shown in Fig. 1, wooden abutments, 3 ft. wide, 3 ft. apart, and about 1 ft. high, were built and filled solidly with sand. Wooden walls, 3 ft. apart and 4 ft. high, were then built crossing the abutments, and solidly cleated and braced frames were placed across their ends about 2 ft. back of each abutment. A false bottom, made to slide freely up and down between the abutments, and projecting slightly beyond the walls on each side, was then blocked up snugly to the bottom edges of the sides, thus obtaining a box 3x4x7 ft., the last dimension not being important. Bolts, 44 ins. long, with long threads, were run up through the false bottom and through 6x15x2in. pine washers to nuts on the top. The box was filled with ordinary coarse sand from the trench, the sand being compacted as thoroughly as possible. The ends were tightened down on the washers, which in turn bore on the compacted sand. The blocking was then knocked out from under the false bottom, and the following was noted:

As soon as the blocking was removed the bottom settled nearly 2 ins., due to the initial compacting of the sand under the arching stresses. A measurement was taken from the bottom of the washers to the top of the false bottom, and it was noted as 41 ins. (Fig. 1). After some three or four hours, as the arch had not been broken, it was decided to test it under greater loading, and four men were placed on it, four others standing on the haunches. Under this additional loading of about 600 lbs. the bottom settled 2 ins. more, or nearly 4 ins. in all, due to the further compression of the sand arch. About an hour after the superimposed load had been removed, the writer jostled the box with his foot sufficiently to dislodge some of the exposed sand, when the arch at once collapsed and the bottom fell to the ground.

Referring to Fig. 2, if, instead of being ordinary sand, the block comprised within the area, *A U J V X*, had been frozen sand, there can be no reason to suppose that it would not have sustained itself, forming a perfect arch, with all material removed below the line, *V E J*, in fact, the freezing process of tunneling in soft ground is based on this well-known principle.

If, then, instead of removing the mass, *J E V*, it is allowed to remain and is supported from the mass above, one must concede to this mass in its normal state the same arching properties it would have had if frozen, excepting, of course, that a greater thickness of key should be allowed, to offset a greater tendency to compression in moist and dry as against frozen sand, where both are measured in a confined area.

If, in Fig. 2, $E\,V\,J = \phi$ = the angle of repose, and it be assumed that *A J*, the line bisecting the angle between that of repose and the perpendicular, measures at its intersection with the middle vertical (*A*, Fig. 2) the height which is necessary to give a sufficient thickness of key, it may be concluded that this sand arch will be self-sustaining. That is, it is assumed that the arching effect is taken up virtually within the limits of the area, *A N₁ V E J N A*, thus relieving the structure below of the stresses due to the weight or thrust of any of the material above; and that the portion of the material below *V E J* is probably when sustained from below forms a natural "centering" for the natural arch above. It is also probably true that the material in the areas, *X N₁ A* and *A N U*, does not add to the arching strength, more especially in those materials where cohesion may not be counted on as a factor. This is borne out by the fact that, in the experiment noted, a well-defined crack developed on the surface of the sand at about the point U_1, and extended apparently a considerable depth, assumed to be at *N*, where the haunch line is intersected by the slope line from *A*.

In this experiment the sand was good and sharp, containing some gravel, and was taken directly from the adjoining excavation. When thrown loosely in a heap, it assumed an angle of repose of about 45°. It should be noted that this material when tested was not compacted as much, nor did it possess the same cohesion, as sand in its normal undisturbed condition in a bank, and for this reason it is believed that the depth of key given here is absolutely safe for all except extraordinary conditions, such as non-homogeneous material and others which may require special consideration.

Referring again to the area, *A N₁ V J N A*, Fig. 2, it is probable that, while self-sustaining, some at least of the lower portion must derive its initial support from the "centering" below, and the writer has made the arbitrary assumption that the lower half of it is carried by the structure while the upper half is entirely independent of it, and, in making this assumption, he believes he is adding a factor of safety thereto. The area, then, which is assumed to be carried by an underground structure the depth of which is sufficient to allow the lines, *V A* and *J A*, to intersect below the surface, is the lower half of *A N₁ V E J N A*, or its equivalent, *A V E J A*, plus the area, *V E J*, or *A V J A*, the angle, *A V J*, being $\alpha = \frac{1}{2}(90° - \phi) + \phi = 45° + \frac{\phi}{2}$.

It is not probable that these lines of thrust or pressure transmission, *A N*, *D K*, etc., will be straight, but, for purposes of calculation, they will be assumed to be so, also, that they will act along and parallel to the lines of repose of their natural slope, and that the thrust of the earth will therefore be measured by the relation between the radius and the tangent of this angle multiplied by the weight of material affected. The dead weight on a plane, *V J*, due to the material above, is, therefore, where

l = span or extreme width of opening = $V J$,

W = weight per cubic foot of material, and

W_1 = weight per linear foot.

$$W_1 = \frac{2 \times \frac{l}{2}\tan.\alpha \times W}{2} = \frac{1}{2} l \tan\left\{\frac{1}{2}(90° - \phi) + \phi\right\} W = \frac{l}{2}\tan.\left(45° + \frac{\phi}{2}\right) W.$$

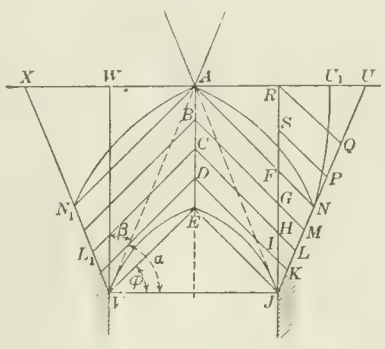

Fig. 2.

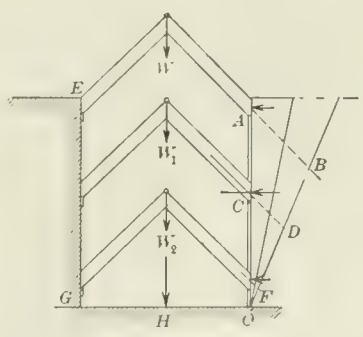

Fig. 3.

The application of the above to flat arched or circular tunnels is very simple, except that the question of side thrust should be considered also as a factor. The thrust against the side of a tunnel in dry sand having a flat angle of

*Paper by J. C. Meem, read before the American Society of Civil Engineers, May 18, 1910, and published in the Proceedings, Vol. XXXVI, p. 653.

†Transactions Am. Soc. C. E., Vol. LX, p. 1.

repose will necessarily be greater than in very moist sand or clay, which stands at a much steeper angle, and, for the same reason, the arch thrust is greater in dryer sand and therefore the load on a tunnel structure should not be as great, the material being compact and excluding cohesion as a factor. This can be illustrated by referring to Fig. 3 in which it is seen that the flatter the position of the "rakers" keying at W_1, W_2, and W, the greater will be the side thrust at A, C, and F. It can

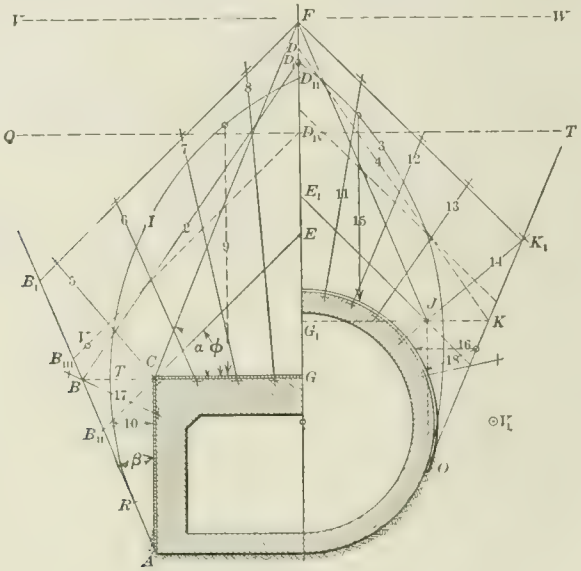

Fig. 4.

also be illustrated by assuming that the arching material is composed of cubes of polished marble set one vertically above the other in close columns. There would then be absolutely no side thrust, but, likewise, no arching properties would be developed, and an indefinite height would probably be reached above the tunnel roof before friction enough would be developed to cause it to relieve the structure of any part of its load. Conversely, if it be assumed that the superadjacent material is composed of large bowling balls, interlocking with some degree of regularity, it can be seen that those above will form themselves into an arch over the "centering" made up of those supported directly by the roof of the structure, thus relieving the structure of any load except that due to this "centering."

If, now, the line, $A\ B$, in Fig. 4, be drawn so as to form with $A\ C$ the angle, β, to be noted later, and it be assumed that it measures the area of pressure against $A\ C$, and if the line, $C\ F$, be drawn, forming with $C\ G$, the angle α, noted above, then $G\ F$ can be reduced in some measure by reason of the increase of $G\ C$ to $C\ B$, because the side thrust above the line, $B\ C$, has slightly diminished the loading above. The writer makes the arbitrary assumption that this decrease in $G\ F$ should equal 20 per cent of $B\ C = F\ D_1$. If, then, the line, $B\ D_1$ be drawn, it is conceded that all the material within the area, $A\ B\ D_1\ G\ C\ A$, causes direct pressure against or upon the structure, $G\ C\ A$, the vertical lines being the ordinates of pressure due to weight, and the horizontal lines (qualified by certain ratios) being the abscissas of pressure due to thrust. An extreme measurement of this area of pressure is doubtless approximately more nearly a curve than the straight lines given, and the curve, $A\ R\ T\ I\ D_2$, is therefore drawn in to give graphically and approximately the safe area of which any vertical ordinate, multiplied by the weight, gives the pressure on the roof at that point, and any horizontal line, or abscissa, divided by the tangent of the angle of repose and multiplied by the weight per foot, gives the pressure on the side at that point.

The practical conclusion of this whole assumption is that the material in the area, $F\ E\ C\ B\ B_1$, forms with the equivalent opposite area an arch reacting against the face, $C\ B\ B_1$, and that, as heretofore noted, the lower half (or its equivalent, $B\ D_1\ G\ B$) of the weight of this is assumed to be carried by the structure, the upper half being self-sustaining, as shown by the line, $B_{III}\ D_{IV}$ (or for absolute safety the curved line), and therefore, if rods could be run from sheeting inside the tunnel area to a point outside the line, $F\ B_1$, as indicated by the lines, 5, 6, 7, 8, 11, 12, 13, etc., that the internal bracing of this tunnel could be omitted, or that the tunnel itself would be relieved of all loading, whereas these rods would be carrying some large portion at least of the weight within the area circumscribed by the curve, $D_{II}\ I\ T\ G$, and further, that a tunnel structure of the approximate dimensions shown would carry its maximum load with the surface of the ground between D_{IV} and F, beyond which point the pressure would remain the same for all depths.

In calculating pressures on circular arches, the arched area should first be graphically resolved into a rectangular equivalent, as in the right half of Fig. 4, proceeding subsequently as noted.

The following instances are given as partial evidence that in ordinary ground, not submerged, the pressures do not exceed in any instance those found by the above methods, and it is very probable that similar instances or experiences have been met by every engineer engaged in soft-ground tunneling:

In building the Bay Ridge tunnel sewer, in 62d and 64th streets, Brooklyn, arch timber bracing was used for more than 4,000 ft., or for two-thirds of the whole 5,800 ft. called for in the contract. The external width of opening, measured at the wall-plate, averaged about 19 ft. for the 14½-ft. circular sewer and 19½ ft. for the 15-ft. sewer. The arch timber segments in the cross-section were 10x12-in. North Carolina pine of good grade, with 2 ins. off the butt for a bearing to take up the thrust. They were set 5 ft. apart on centers, and rested on 6x12-in. wall-plates of the same material as noted above.

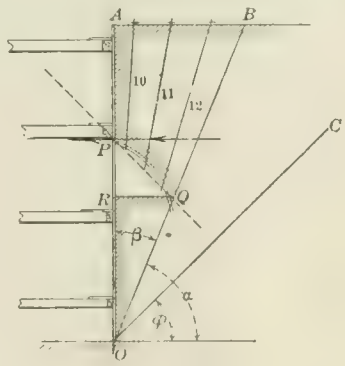

Fig. 5.

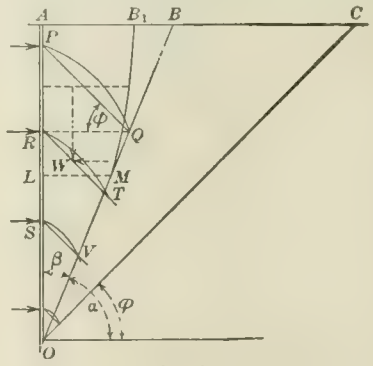

Fig. 6.

The ultimate strength of this material, across the grain, when dry and in good condition, as given by the United States Forestry Department tests is about 1,000 lbs. in compression. Some tests* made in 1907 by Mr. E. F. Sherman for the Charles River Dam in Boston, Mass., show that in yellow pine, which had been water-soaked for two years, checks began to open at from 388 to 581 lbs. per sq. in., and that yields of ¼ in. were noted at 600 to 1,000 lbs. As the tunnel wall-plates described in this paper were subject to occasional saturation, and always to a moist atmosphere, they could never have been considered as equal to dry material. Had the full loading shown by the foregoing come on these wall-plates, they would have been subjected to a stress of about 25 tons each, or nearly one-half of their ultimate strength. In only one or two instances, covering stretches of 100 ft. in one case and 200 ft. in another, where there were large areas of quicksand sufficient to cause semi-aqueous pressure, or pockets of the same material causing eccentric loading, did these wall-plates show any signs of heavy pressure, and in many instances they were in such good condition that they could be taken out and used a second and a third time. Two especially interesting instances came under the writer's observation: In one case, due to a collapse of the internal bracing, the load of an entire section, 25 ft. long and 19 ft. wide, was carried for several hours on ribs spaced 5 ft. apart. The minimum cross-section of these ribs was 73 sq. ins., and they were under a stress, as noted above, of 50,000 lbs. or nearly up to the actual limit of strength of the wall-plate where the rib bore on it. When these wall-plates were examined, after replacing the internal bracing, they did not appear to have been under any unusual stress.

In another instance, for a distance of more than 700 ft., the sub-grade of the sewer was 4 ft. below the level of the water in sharp sand. In excavating for "bottoms" the water had to be pumped at the rate of more than 300 gals. per min., and it was necessary to close-sheet a trench between the wall-plates in which to place a section of "bottom." In spite of the utmost care, some ground was necessarily lost, and this was shown by the slight subsidence of the wall-plates and a loosening up of the wedges in the supports bearing on the arch timbers. During this operation of "bottoming," two men on each side were constantly employed in tightening up wedges and shims above the arch timbers. It is impossible to explain the fact that these timbers slackened (without proportionate roof settlement) by any other theory than that the arching was so nearly perfect that it relieved the bracing of a large part of the load, the ordinary loose material being held in place by the arching or wedging together of the 2-in. x 3-ft. sheeting boards in the roof, arranged in the form of a segmental arch. The material above this roof was coarse, sharp sand, through which it had been difficult to tunnel without losing ground, and it had admitted water freely after each rain until the drainage of a neighboring pond had been completed, the men never being willing

*Engineering News, July 1, 1909.

to resume work until the influx of water had stopped.

The foregoing applies only to material ordinarily found under ground not subaqueous, or which cannot be classed as aqueous or semi-aqueous material. These conditions will be noted later.

The writer will take up next the question of pressures against the faces of sheeted trenches or retaining walls, in material of the same character as noted above. Referring

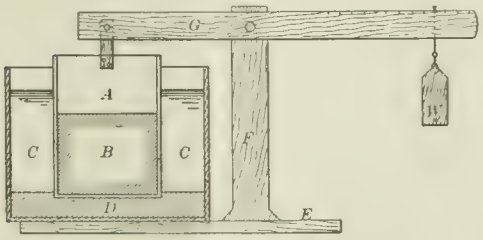

Fig. 7.

to Fig. 2, it is not reasonable to suppose that having passed the line, *R F J*, the character of the stresses due to the thrust of the material will change, if bracing should be substituted for the material in the area, *W V J R*, or if, as in Fig. 3, canvas is rolled down along the lines, *E G* and *A O*, and if, as this section is excavated between the canvas faces, temporary struts are erected, there is no reason to believe that with properly adjusted weights at *W or* W_2, an exact equilibrium of forces and conditions cannot be obtained. Or, again, if, as in Fig. 5, the face, *P Q*, is sheeted and rodded back to the surface, keying the rods taut, there is undoubtedly a stable condition and one which could not fail in theory or practice, nor can anyone, looking at Fig. 5, doubt that the top timbers are stressed more heavily than those at the bottom. The assumption is that the tendency of the material to slide toward the toe causes it to wedge itself between the face of the sheeting on the one hand and some plane between the sheeting and the plane of repose on the other, and that the resistance to this tendency will cause an arching thrust to be developed along or parallel to the lines, *A N*, *B M*, etc., Fig. 2, which are assumed to be the lines of repose, or curves approximating thereto. As the thrust is greatest in that material directly at the face, *A O*, Fig. 6, and is nothing at the plane of repose, *C O*, may be assumed arbitrarily that the line, *B O*, bisecting this angle divides this area into two, in one of which the weight resolves itself wholly into thrust, the other being an area of no thrust, or wholly of weight bearing on the plane of repose. Calling this line, *B O*, the haunch line, the thrust in the area, *A O B*, is measured by its weight divided by the tangent of the angle, *P Q R* = ϕ, which is the angle of repose: that is, the thrust at any given point, $R = R\ O \div \tan.\ \phi$.

The writer suggests that, in those materials which have steeper angles of repose than 45°, the area of pressure may be calculated as above, the thrust being computed, however, as for an angle of 45°.

In calculating the total pressure due to this thrust against the retaining wall or sheeted face, there is the weight of the mass multiplied by the distance of its center of gravity vertically above the toe, or approximately:

$$\text{Area, } A\ O\ B, \times \text{weight per unit} \times \frac{2}{3} \text{ height,}$$

where h = height,

W = weight per foot of material = 90 lbs.,

and $\beta = \frac{90° - \phi}{2}$

P = pressure per linear foot (vertically),

then $P = h \times \frac{h}{2} \text{ (tan. } \beta) \times W \times \frac{2}{3} h = \frac{1}{3} h^3 \text{ tan. } \beta.$

The next points to be considered are the more difficult problems concerning subaqueous or saturated earths. The writer has made some experiments which appear to be conclusive, showing that, except in pure quicksand or wholly aqueous material, as described later, the earth and water pressures act independently of each other.

For a better understanding of the scope and purpose of this paper, the writer divides supersaturated or subaqueous materials into three classes:

Class A.—Firm materials, such as coarse and fine gravels, gravel and sands mixed, coarse sands, and fine sands in which there is not a large proportion of fine material, such as loam, clay, or pure quicksand.

Class B.—Semi-aqueous materials, such as fine sands in which there is a large proportion of clay, etc., pure clays, silts, peats, etc.

Class C.—Aqueous materials, such as pure quicksands, in which the solid matter is so finely divided that it is amorphous and virtually held in suspension, oils, quicksilver, etc.

Here it may be stated that the term, "quicksand," is so illusive that a true definition of it is badly needed. Many engineers call quicksand any sand which flows under the influence of water in motion. The writer believes the term should be applied only to material so "soupy" that its properties are practically the same as water under static conditions, it being understood that any material may be unstable under the influence of water at sufficiently high velocities, and that it is with a static condition, or one approximately so, that this paper deals.

A clear understanding of the firm materials noted in Class A will lead to a better solution of problems dealing with those under Class B, as it is to this Class A that the experiments largely relate.

The experiments noted below were made with varying material, though the principle type used was a fine sand under the conditions in which it is ordinarily found in excavations, with less than 40 per cent voids and less than 10 per cent of very fine material.

Experiment No. 2.—The first of these experiments, which in this series will be called No. 2, was simple, and was made in order to show that this material does not flow readily under ordinary conditions, when not coupled with the discharge of water under high velocity. A bucket 12 ins. in diameter, containing another bucket 9 ins. in diameter, was used. A 6x6-in. hole was cut in the bottom of the inner bucket. About 3 ins. of sand was first placed in the bottom of the larger bucket and it was partly filled with water. The inside bucket was then given a false bottom and partly filled with wet sand, resting on the sand in the larger bucket. Both were filled with water and the weight, *W*, Fig. 7, on the arm was shifted until it balanced the weight of the inside bucket in the water, the distance of the weight, *W*, from the pivot being noted. The false bottom was then removed and the inside bucket, resting on the sand in the larger one, was partly filled with water, the conditions at the point of weighing being exactly the same, except that the false bottom was removed, leaving the sand in contact through the 6x6-in. opening. It is readily seen that, if the sand had possessed the aqueous properties sometimes attributed to sand under water, that in the inside bucket would have flowed out through the square hole in the bottom, allowing it to be lifted by any weight in excess of the actual weight of the bucket, less its buoyancy, as would be the case if it contained only water instead of sand and water. It was found, however, that the weight resting at a distance of more than nine-tenths of the original distance from the pivot, would not raise the inside bucket. On lifting this inside bucket bodily, however, the water at once forced the sand out through the bottom, leaving a hole almost exactly the shape and size of the bottom orifice. It should be stated that, in each case, the sand was put in in small handfuls and thoroughly mixed with water, but not packed, and allowed to stand for some time before the experiments were tried, to insure the compactness of ordinary conditions. The sand was stable enough to allow the bucket to be put on its side for the moment of being photographed, although it had been pulled out of the water a little less than 3 mins.

Experiment No. 3.—In order to show that the arching properties of sand are not destroyed under subaqueous conditions, a small sand-box, having a capacity of about 1 cu. ft., and similar to that described in Experiment No. 1, was made. The bottom was cut out, with the exception of a ¾-in. projection on two sides, and a false bottom was placed below and outside of the original bottom, with bolts running through it, keying to washers on top of the sand, with which the box was partially filled. One side of the box contained a glass front, in order that conditions of saturation could be observed. The box of sand was then filled with water and, after saturation had been completed and the nuts and washers had been tightened down, the box was lifted off the floor. There was found to be no tendency whatever for the bottom to fall away, showing conclusively that the arching properties had not been destroyed by the saturation of the sand.

The next three experiments were intended to show the relative pressure over any given area in contact with the water in the one case or sand and water in the other.

Experiment No. 4.—The apparatus for this experiment consisted of a 3-in. pipe about 4 ins. long and connected with a ¾-in. goose-neck pipe 17 ins. high above the top of the bowl shown in Fig. 8. A loose rubber valve was intended to be seated on the upper face of the machined edge of the bowl and weighted down sufficiently to balance it against a head of water corresponding to the 17-ins. head in the goose-neck. The bowl was then to be filled with sand and the difference, if any, noted between the weight required to hold the flap-valve down under the same head of water flowing through the sand. The results of this experiment were not conclusive, owing to the difficulty of making contact over the whole area of the sand and the rim of the bowl at the same time. At times, for instance, less than 1 lb. would hold back the water indefinitely, while, again, 2 or 3 lbs. would be required as opposed to the 4½ lbs. approximate pressure required to hold down the clear water. Again, at times the water would not flow through the neck at all, even after several hours, and after increasing the head by attaching a longer rubber tube thereto. In view of these conditions, this experiment would not be noted here, except that it unexpectedly developed one interesting fact. In order to insure against a stoppage of water, as above referred to, gravel was first put into the bottom of the bowl and the flap-valve was then rubbed down and

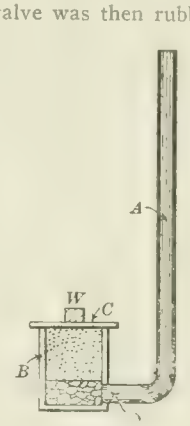

Fig. 8.

held tightly while the pipe was filled. On being released, the pressure of water invariably forced out the whole body of sand. Care was taken to see that the sand was saturated in each case, and the experiment was repeated numberless times, and invariably with the same result. The sand contained about 40 per cent of voids. The deduction from this experiment is that the pressure of water is against rather than through sand and that any excess of voids occurring adjacent to a face against which there is pressure of water will be filled with sand, excepting in so far, of course, as the normal existing voids allow the pressure of the water to be transmitted through them.

If, then, the covering of sand over a structure is sufficiently heavy to allow arching to be set up, the structure against which the pressure is applied must be relieved of much of the pressure of water against the area of sand not constituted as voids acting outside of the arching area. This is confirmed by the two following experiments:

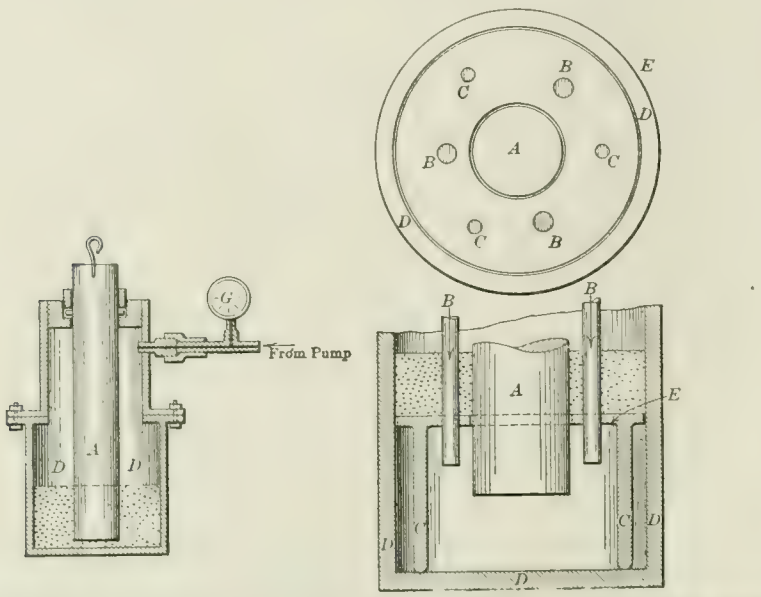

Fig. 9.—Apparatus for Measuring Loss of Water Pressure in Subaqueous Material.

Experiment No. 5.—The same apparatus was used here as in Experiment No. 2, Fig. 7, except that the inside bucket had a solid bottom. The inside and outside buckets were filled with water and the point was noted at which the weight would balance the inside bucket at a point some 3 ins. off the bottom of the outside bucket. This point was measured, and the bottom of the larger bucket was covered over with sand so that in setting solidly in the sand the inside bucket would occupy the same relative position as it did in the water. The same weight was then applied and would not begin to lift the inner bucket. For instance, in the first part of the experiment the weight stood at 12 ins. from the pivot, while in the next step the weight, standing at the end of the bar, had no effect, and considerable external pressure had to be exerted before the bucket could be lifted. Immediately after it was relieved, however, the weight at 12 ins. would hold it clear of the sand. No attempt was made to work the bucket into the sand; the sand was leveled up and the bucket was seated on it, turned once or twice to insure contact, and then allowed to stand for some time before making the experiment. No attempt was made to establish the relationship between sands of varying voids, the general fact only being established, by a sufficient number of experiments, that the weight required to lift the bucket was more than double in sand having 40 per cent of voids than that required to lift the bucket in water only.

Experiment No. 6.—The apparatus for this experiment consisted essentially of a hydraulic chamber about 8 ins. in diameter and 1 ft. high, the top being removable and containing a collar with suitable packing, through which a 2½-in. piston moved freely up and down, the whole being similar to the cylinder and piston of a large hydraulic jack. Just below the collar and above the chamber there was a ½-in. inlet leading to a copper pipe and thence to a high-pressure pump. Attached to this there was a gage to show the pressure obtained in the chamber, all as shown in Fig. 9. The purpose of the apparatus was to test the difference in pressure on any object submerged in clear water and on the same object buried in the sand under water. It is readily seen that, if pressure be applied to the water in this chamber, the amount of pressure (as measured by the gage) necessary to lift the piston will be that due to the weight of the piston, less its displacement, plus the friction of the piston in the collar.

Now, if for any reason the bottom area of the piston against which the water pressure acts be reduced, it will necessarily require a proportionate amount of increase in the pressure to lift this piston. If, therefore, it is found that 10 lbs., for illustration, be required to lift the piston when plunged in clear water, and 20 lbs. be required to lift it when buried in sand, it can be assumed at once that the area of the piston has been reduced 50 per cent by being buried in the sand, eliminating the question of the friction of the sand itself around the piston. In order to determine what this friction might be, the writer arranged a table standing on legs above the bottom of the chamber, allowing the piston to move freely through a hole in its center. Through this table pipes were entered (as shown in part of Fig. 9). The whole was then placed in the chamber with the piston in place, and the area above was filled with sand and water. It is thus seen that, the end of the piston being free and in clear water, the difference, if any, between the pressure required to lift the piston when in clear water alone and in the case thus noted, where it was surrounded by sand, would measure the friction of the sand on the piston. After several trials of this, however, it was clearly seen that the friction was too slight to be noted accurately by a gage registering single pounds, that is, with a piston in contact with 6 ins. of sand vertically, a friction of 25 lbs. per sq. ft. would only require an increase of 1.8 lbs. on the gage. It is therefore assumed that the friction on so small a piston in sand need not be considered as a material factor in the experiments made.

The piston was plunged into clear water, and it was found that the pressure required to lift it was about 4 lbs. The cap was then taken off, a depth of about 2 ins. of sand was placed in the bottom of the chamber, and then the piston was set in place and surrounded by sand to a depth of some 6 ins., water being added so that the sand was completely saturated. This was allowed to stand until it had regained the stability of ordinary sand in place, whereupon the cap with the collar bearing was set in place over the piston, the machine was coupled up, and the pump was started. A series of four experiments, extending over a period of two or three days, gave the following results.

Test 1.—The piston began to move at a pressure of 25 lbs. The pressure gradually dropped to 7½ lbs., at which point, apparently, it came out of the sand, and continued at 7½ lbs. during the remainder of the test.

Test 2.—The piston was plunged back into the sand, without removing the cap, and allowed to stand for about 2 hours. No attempt was made to pack the sand or to see its condition around the piston, it being presumed, however, that it had reasonable time to get a fair amount of set. At slightly above 20 lbs. the piston began to move, and as soon as a pocket of water accumulated behind the piston the pressure immediately dropped to 9 lbs. and continued at this point until it came out of the sand.

Test 3.—The piston was plunged into the sand and hammered down without waiting for the sand to come to a definite set. In this case the initial pressure shown by the gage was 17½ lbs., which immediately dropped to 8 lbs. as soon as the piston had moved sufficiently far to allow the water to accumulate below it.

Test 4.—The cap was again removed, the piston set up in place, the sand compacted around it in approximately the same condition it would have had if the sand had been in place underground; the cap was then set in place and, after an hour, the pump was started. The pressure registered was 25 lbs. and extend over a period of several seconds before there was any movement in the piston. The piston responded finally without any increase of pressure, and, after lifting an inch or two, the pressure gradually dropped to 10 lbs., where it remained until the piston came out of the sand.

The sum and average of these tests shows a relation of 22 lbs. for the piston in sand to about 8½ lbs. as soon as the volume of water had accumulated below it, which would correspond very closely to a sand containing 40 per cent of voids, which was the characteristic of the sand used in this experiment.

The conclusions from this experiment appear to be absolutely final in illustrating the pressure due to water on a tunnel buried in sand, either on the arch above or on the sides or bottom, as well as the buoyant effect upon the tunnel bottom under the same conditions.

While the apparatus would have to be designed and built on a much larger scale in order to measure accurately the pressure due to sands and earths of varying characteristics, it appears to be conclusive in showing the principle, and near enough to the theoretical value to be taken for practical purposes in designing structures against water pressures when buried in sand or earth.

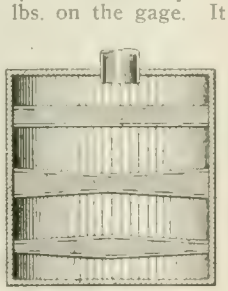

Fig. 10.

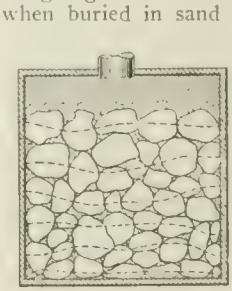

Fig. 11.

It should be carefully noted that the friction of the water through sand, which is always a large factor in subaqueous construction, is virtually eliminated here, as the water pressure has to be transmitted only some 6 or 8 ins. to actuate the base of the piston, whereas in a tunnel only half submerged this distance might be as many feet, and would be a considerable factor.

It should be noted also that although the area subject to pressure is diminished, the pressure on the area remaining corresponds to the full hydrostatic head, as would be

shown by the pressure on an air gage required to hold back the water, except, of course, as it may be diminished more or less by friction.

The writer understands that experiments of a similar nature and with similar apparatus have been tried on clays and peats with results considerably higher; that is, in one case, there was a pressure of 40 lbs. before the piston started to move.

The following is given, in part, as an analysis and explanation of the above experiments and notes:

It is well known that if lead be placed in a hydraulic press and subjected to a sufficient pressure it will exhibit properties somewhat similar to soft clay or quicksand under pressure. It will flow out of an orifice or more than one orifice at the same pressure. This is due to the fact that practically voids do not exist and that the pressure is so great, compared with the molecular cohesion, that the latter is virtually nullified. It is also theoretically true that solid stone under infinitely high pressure may be liquefied. If in the cylinder of a hydraulic press there be put a certain quantity of cobblestones, leaving a clearance between the top of the stone and the piston, and if this space, together with the voids, be filled with water and subjected to a great pressure, the sides or the walls of the cylinder are acted on by two pressures, one almost negligible, where they are in contact with the stone, restraining the tendency of the stone to roll or slide outward, and the other due to the pressure of the water over the area against which there is no contact of stone. That this area of contact should be deducted from the pressure area can be clearly shown by assuming another cylinder with cross-sticks jammed into it, as shown in Fig. 10. A glance at this figure will show that there is no aqueous pressure on the walls of the cylinder with which the ends of the sticks come in contact and the loss of the pressure against the walls due to this is equal to the least sectional area of the stick or tube either at the point of contact or intermediate thereto.

Following this reasoning, in Fig. 11 it is found that an equivalent area may be deducted covering the least area of continuous contact of the cobblestones, as shown along the dotted lines in the right half of the figure. Returning, if, when the pressure is applied, an orifice be made in the cylinder, the water will at once flow out under pressure, allowing the piston to come in contact with the cobblestones. If the flow of the water were controlled, so as to stop it at the point where the stone and water are both under direct pressure, it would be found that the pressures were totally independent of each other. The aqueous pressure, for instance, would be equal at every point, while the pressure on the stone would be through and along the lines of contact. If this contact was reasonably well made and covered 40 per cent of the area, one would except the stone, independently of the water, to stand 40 per cent of the pressure which a full area of solid stone would stand. If this pressure should be enormously increased after excluding the water, it would finally result in crushing the stone into a solid mass; and if the pressure should be increased indefinitely, some theoretical point would be reached, as above noted, where the stone would eventually be liquefied and would assume liquid properties.

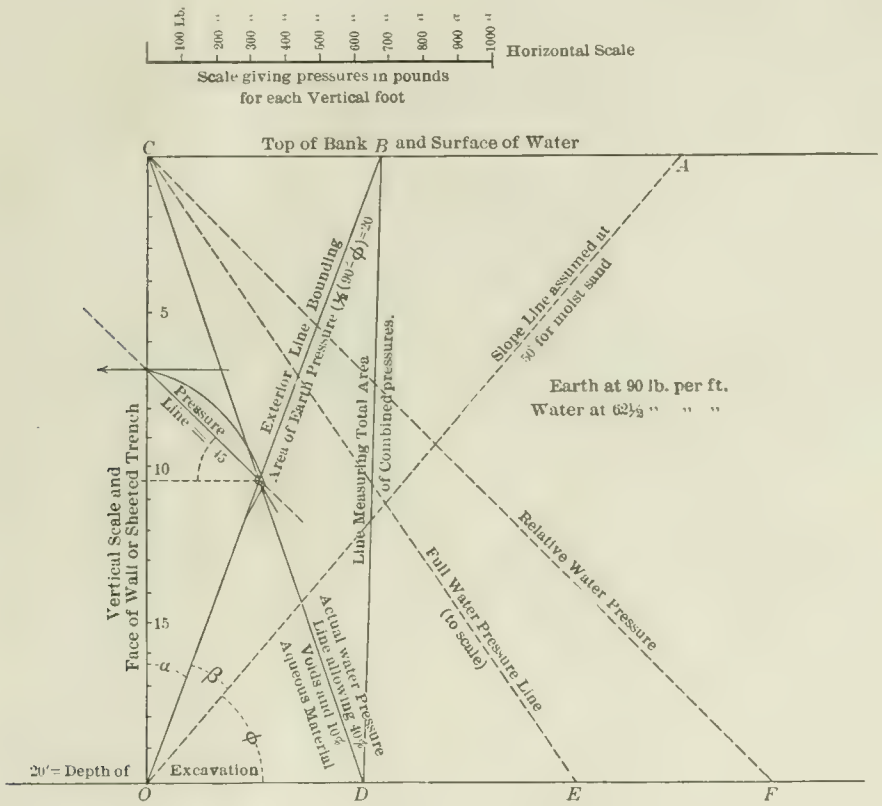

Fig. 12.—Combined Earth and Water Pressures.

It was the knowledge of this principle which enabled the contractors to jack up successfully the roof of a long section of the cast-iron lined tubes under Joralemon street in Brooklyn, in connection with the reconstruction of the Battery tubes at that point, the method of operation being to cut through a section of the roof, 4x10 ft. in area, through which holes were drilled and through which again the sand was "bled," heavy pressure being applied from below through the medium of hydraulic jacks. By a careful manipulation of both these operations, sections of the roof of the above dimensions were eventually raised the required height of 30 ins. and permanently braced there in a single shift.

If water in excess be put into a cylinder containing sand, and pressure be applied thereto, the water, if allowed to flow out of an orifice, will carry with it a certain quantity of sand, according to the velocity, and the observation of this might easily give rise to the erroneous impression that the sand, as well as the water, was flowing out under pressure, and, as heretofore stated, has caused many engineers and contractors to apply the term "quicksand" to any sand flowing through an orifice with water.

Sand in its natural bed always contains some fine material, and where this is largely less than the percentage of voids, it has no material effect on the pressure exerted by the sand with or without water, as above noted. If, however, this fine material be largely in excess of the voids, it allows greater initial compression to take place when dry, and allows to be set up a certain amount of hydraulic action when saturated. If the base of the material be sand and the fill be so-called quicksand in excess of the voids, pressure will cause the quicksand to set up hydraulic action, and the action of the piston will appear to be similar to that of a piston acting on purely aqueous material.

Just here the writer desires to protest against considering semi-aqueous masses, such as soupy sands, soft concrete, etc., as exerting hydrostatic pressure due to their weight in bulk instead of to the specific gravity of the basic liquid. For instance, restoring again to the illustration of cubes and spheres, it may be assumed that a cubical receptacle has been partly filled with small cubes of polished marble, piled vertically in columns. When this receptacle is filled with liquid around the piles of cubes there will be no pressure on the sides except that due to the hydrostatic pressure of the water at 62½ lbs. The bottom, however, will resist a combined pressure due to the water and the weight of the cubes. Again, assume that the receptacle is filled with small spheres, such as marbles, and that water is then poured in. The pressure due to the weight of the solids on the bottom is relieved by the loss in weight of the marbles due to the water, and also to the tendency of the marbles to arch over the bottom, and while the pressure on the sides is increased by this amount of thrust, the aqueous pressure is still that of a liquid at 62½ lbs., and it is inconceivable that some engineers, in calculating the thrust of aqueous masses, speak of it as a liquid weighing, say, 120 or 150 lbs. per cu. ft.; as well might they expect to anchor spherical copper floats in front of a bulkhead and expect the hydrostatic pressure against this bulkhead to be diminished because the actual volume and weight of the water directly in front of the bulkhead has been diminished. Those who have had experience in tying narrow deep forms for concrete with small wires or bolts and quickly filling them with liquid concrete, must realize that no such pressures are ever developed as would correspond to liquids of 150 lbs. per cu. ft. If the solid material in any liquid is agitated so that it is virtually in suspension, it cannot add to the pressure, and if allowed to subside it acts as a solid, independently of the water contained with it, although the water may change somewhat the properties of the material, by increasing or changing its cohesion, angle of repose, etc. That is, in substance, those particles which rest solidly on the bottom and are in contact to the top of the solid material, do not derive any buoyancy from the water, while those particles not in contact with the bottom directly or through other particles, lose just so much weight through buoyancy. If, then, the vertical depth of the earthy particles or sand above the bottom is so small that the arching effect against the sides is negligible,

the full weight of the particles in contact, directly or vicariously, with the bottom acts as pressure on the bottom, while the full pressure of the water acts through the voids or on them, or is transmitted through material in contact with the bottom.

Referring now to materials such as clays, peats, and other soft or plastic materials, it is idle to assume that these do not possess pressure-resisting and arching properties. For instance, a soft clay arch of larger dimensions, under the condition described early in this paper, would undoubtedly stand if the rods supporting the intrados of the arch were keyed back to washers covering a sufficiently large area.

The fact that compressed air can be used at all in tunnel work is evidence that semi-aqueous materials have arching properties, and the fact that "blows" usually occur in light cover is further evidence of it.

When air pressure is used to hold back the water in faces of large area, bracing has to be resorted to. This again shows that while full hydrostatic pressure is required to hold back the water, the pressure of the earth is in a measure independent of it.

In a peaty or boggy material there is a condition somewhat different, but sufficiently allied to the soft clayey or soupy sands to place it under the same head in ordinary practice. It is undoubtedly true that piles can be driven to an indefinite depth in this material, and it is also true that the action of the pile is to displace rather than compress, as shown by the fact of driving portions of the tunnels under the North River for long distances without opening the doors of the shield or removing any of the material. The case of filling in bogs or marshes, causing them to sink at the point of filling and rise elsewhere, is readily explained by the fact that the water is confined in the interstices of the material, admitting of displacement but no compression.

The application of the above to pressures over tunnels in materials of Class A is that sand or solid matter is virtually assumed to be a series of columns with their bases in such intimate contact with the tunnel roof that water cannot exert pressure on the tunnel or buoyancy on the sand at the point of contact, and that if these columns are sufficiently deep to have their upper portions wholly or partially carried by the arching or wedging action, the pressure of any water on their surfaces is not transferred to the tunnel, and the only aqueous pressure is that which acts on the tunnel between the assumed columns or through the voids.

Let l = exterior width of tunnel,
δ = depth of cover, as:
D_w = depth, water to roof,
D_e = " earth to roof,
D_x = " of cover of earth necessary to arching stability, that is:

$$D_x = \frac{l}{2}\left(\tan.\left(\frac{90^\circ - \phi}{2}\right) + \phi\right) = \frac{l}{2}\tan.\left(45^\circ + \frac{\phi}{2}\right),$$

where ϕ = angle of repose,
and $D_w + D_e = D_x$.

Then the pressure on any square foot of roof, as V_p, as at the base of any vertical ordinate, as G in Fig. 2, $= V_p$.

W_e = weight per cubic foot of earth (90 lbs.),
W_w = weight per cubic foot of water (62½ lbs.),

we have

$$V_p = V_e \times W_e + D_w \times W_w \times 0.40 = V_e \times 90 + D_w \times 62\tfrac{1}{2} \times 0.4 = V_e 90 + D_w \times 25$$

And for horizontal pressure:

P_h = the horizontal pressure at any abscissa (10), Fig. 2, $= A_{10}$ at depth of water D_{w_1} is

$$P_h = \frac{A_{10} \times 90}{\tan.\phi} + D_{w_1} \times 62\tfrac{1}{2} \times 0.4 = \frac{A_{10} \times 90}{\tan.\phi} + D_{w_1} \times 25.$$

The only question of serious doubt is at just what depth the sand is incapable of arching itself, but for purposes of safety the writer has put this at the point F, as noted above, $= D_x$, although he believes that experiments on a large scale would show it to be nearer 0.67 D_x, above which the placing of additional back-fill will lighten the load on the structure.

We have, then, for $D_e < D_x$, the weight of the total prism of the earth plus the water in the voids, plus the added pressure of the water above the earth prism; that is:

The pressure per square foot at the base of any vertical ordinate $= V_p$.

$V_p = D_e \times 90 + D_e \times 62\tfrac{1}{2} \times 0.40 + (D_w - D_e \times 62\tfrac{1}{2}$.

To those who may contend that water acting through so shallow a prism of earth would exert full pressure over the full area of the tunnel, it may be stated that the water cannot maintain pressure over the whole area without likewise giving buoyancy to the sand previously assumed to be in columns, in which case there is the total weight of the water plus the weight of the prism of earth, less its buoyancy in water; that is:

$V_p = D \times 62\tfrac{1}{2} + D \times (90 - 62\tfrac{1}{2})$,

which, by comparison with the former method, would appear to be less safe in its reasoning.

Next is the question of pressure against a wall or braced trench for materials under Class A. The pressure of sand is first calculated independent, as shown in Fig. 6. Reducing this to a basis of 100 lbs. for each division of the scale measured horizontally, as shown, gives the line, B O, Fig. 12, measuring the outside limit of pressure due to the earth, the horizontal distance at any point between this line and the vertical face equaling the pressure against that face divided by the tangent of the angle of repose, which in this case is assumed to be 45°, equaling unity. If the water pressure line, C F, is drawn, it shows the relative pressure of the water. In order to reduce this to the scale of 100 lbs. horizontal measurement, the line, C E, is drawn, representing the water pressure to scale—that is, so that each horizontal measurement of the scale gives the pressure on the face of that point—and, allowing 50 per cent for voids, halving this area gives the line, C D, between which and the vertical face any horizontal line measures the water pressure. Extending these pressure areas where they overlap gives the line, B D, which represents the total pressure against the face, measured horizontally.

Next, as to the question of buoyancy in Class A materials. If a submerged structure rests firmly on a bottom of more or less firm sand, its buoyancy, as indicated by the experiments, will only be a percentage of its buoyancy in pure water, corresponding to the voids in the sand. In practice, however, an attempt to show this condition will fail, owing to the fact that in such a structure the water will almost immediately work under the edge and bottom, and cause the structure to rise, and the test can only be made by measuring the difference in uplift in a heavier than water structure, as shown in Experiment No. 5. For if a structure lighter than the displaced water be buried in sand sufficiently deep to insure it against the influx of large volumes of water below, it will not rise. That this is not due entirely to the friction of the solid material on the sides has been demonstrated by the observation of subaqueous structures, which always tend to subside rather than to lift during or following disturbance of the surrounding earth.

The following is quoted from the paper by Charles M. Jacobs, M. Am. Soc. C. E., on the North River division of the Pennsylvania Railroad tunnels:*

> There was considerable subsidence in the tunnels during construction and lining, amounting to an average of 0.34 ft. between the bulkhead lines. This settlement has been constantly decreasing since construction, and appears to have been due almost entirely to the disturbances of the surrounding materials during construction. The silt weighs about 100 lbs. per cu. ft. * * * and contains about 38 per cent of water. It was found that whenever this material was disturbed outside the tunnels a displacement of the tunnels followed.

*Proceedings, Am. Soc. C. E., for January, 1910.

Thus in substance confirms observations made in the Battery tubes that subsidence of the structure followed disturbance of the outside material, although theoretically the tubes were buoyant in the aqueous material.

The writer would urge, however, that in all cases of submerged structures only partially buried in solid material, excess weighting be used to cover the contingencies of vibration, oscillation, etc., to which such structures may be subjected and which may ultimately allow leads of water to work their way underneath.

On the other hand, he urges that in cases of floor areas of deeply submerged structures, such as tunnels or cellars, the pressure to be resisted should be assumed to be only slightly in excess of that corresponding to the pressure due to the water through the voids.

The question of pressure, etc., in Class B or semi-aqueous materials will be considered next. Of these materials, as already shown, there are two types: (*a*) sand in which the so called quicksand is largely in excess of any normal voids, and (*b*) plastic and viscous materials. The writer believes that these materials should be treated as mixtures of solid and watery particles, in the first of which is quicksand, or aqueous portion, being virtually in suspension, may be treated as water, and it must be concluded that the action here will be similar to that of sand and pure water, giving a larger value to the properties of water than actually exists. If, for instance, it should be found that such a mixture contained 40 per cent of pure water, the writer would estimate its pressure on or against a structure as (*a*) that of a moist sand standing at a steep angle of repose, and (*b*) that of clear water, an allowance of 60 per cent of the total volume being assumed, and the sum of these two results giving the total pressure. Until more definite data can be obtained by experiments on a larger scale, this assumed value of 60 per cent of the total volume for the aqueous portion may be taken for all conditions of semi-aqueous materials, except of course where the solid and aqueous particles may be clearly defined, the pressures being computed as described in the preceding pages.

As to the question of pure quicksand (if such there be) and other aqueous materials of Class C, such as water, oil, mercury, etc., it has already been shown that they are to be considered as liquids of their normal specific gravity; that is, in calculating the air pressure necessary to displace them, one should consider their specific gravity only as a factor and not the total weight per volume including any impurities which they might contain undissolved.

In order to have a clearer conception of aqueous and semi-aqueous materials and their action, they must be viewed under conditions not ordinarily apparent. For instance, ideas of so called quicksand are largely drawn from seeing structures sinking into it or from observing it flowing through voids in the sheeting or casing. The action of sand and water under pressure is viewed during or after a slump, when the damage is being done or has been done, whereas the correct viewpoint is under static conditions, before the slump takes place.

The following is quoted from the report of Mr. C. M. Jacobs, chief engineer of the East River gas tunnel, built in 1902-03:

> We found that the material which had heretofore been firm or stiff had, under erosion, obtained a soup-like consistency, and that a huge cavity some 3 ft. wide and 26 ft. deep had been washed up toward the river bed.

This would probably be a fair description of much of the material of this class met with in such work, if compressed air had not been used. The writer believes that in soft material surrounding submerged structures the water actually contained in the voids is not infrequently, after a prolonged period of rest, cut off absolutely from its sources of pressure and that contact with these sources of pressure will not again be resumed until a leak takes place through the structure, and even when there is a small flow or trickling of water through such material it confines itself

to certain paths or channels and is largely excluded from the general mass.

The broad principle of the bearing power of soil has been made the subject of too many experiments and too much controversy to be considered in a paper which is intended to be a description of experiments and observed data and notes therefrom. The writer is of the opinion, however, that entirely too little attention has been given to this bearing power of the soil; that while progress has been made in our knowledge of all classes of materials for structures, very little has been done which leads to any real knowledge of the material on which the foundation rests. For instance, it is inconceivable that 1 or 2 tons may sometimes be allowed on a square foot of soft clay while the load on firm gravel is limited to from 4 to 6 tons. The writer's practical observations have convinced him that it is frequently much safer to put four times 6 tons on a square foot of gravel than it is to put one-fourth of 2 tons on a square foot of soft clay.

In connection with the bearing power of soil, the writer also believes that too little study has been given to the questions of the lateral pressure of earth, and he desires to quote here from some experiments described in a book* published in England in 1876, to which his attention has recently been called. This book appears to have been intended for young people, but it is of interest to note the following questions from a chapter entitled "Sand." This chapter begins by stating that—

During the course of a lecture on the Suez Canal by Mr. John H. Pepper, which was delivered nightly by him at the Polytechnic Institute in London, he illustrated his lecture by some experiments designed to exhibit certain properties of sand, which had reference to the construction of the Suez Canal, and it is stated that though the properties in question were by no means to be classed among recent discoveries, the experiments were novel in form and served to interest the public audience.

Further quotation follows:

When the Suez Canal was projected, many prophesied evil to the undertaking, from the sand in the desert being drifted by the wind into the canal, and others were apprehensive that where the canal was cut through the sand the bottom would be pushed up by the pressure on the banks * * *.

The principle of lateral pressure may now be strikingly illustrated by taking an American wooden pail and, having previously cut a large circular hole in the bottom, this is now covered with fine tissue paper, which should be carefully pasted on to prevent the particles of sand from flowing through the small openings between the paper and the wood * * * and being placed upright and rapidly filled with sand, it may be carried about by the handle without the slightest fear of the weight of the sand breaking through the thin medium. * * *

Probably one of the most convincing experiments is that which may be formed with a cylindrical tube 18 ins. long and 2 ins. in diameter, open at both ends. A piece of tissue paper is carefully pasted on one end, so that when dry no cracks or interstices are left. The tube is filled with dry sand to a height of say 12 ins. In the upper part is inserted a solid plug of wood 12 ins. long and of the same or very nearly the same diameter as the inside of the tube, so that it will move freely up and down like the piston of an air pump. The tube, sand, and piston being arranged as described, may now be held by an assistant and the demonstrator, taking a sledge hammer, may proceed to strike steadily on the end of the piston and, although the paper will bulge out a little, the force of the blow will not break it.

If the assistant holding the tube allows it to jerk or rebound after each blow of the hammer, the paper may break, because air and sand are driven down by the succeeding blow, and therefore it must be held steadily so that the piston bears fairly on the sand each time.

A still more conclusive striking experiment may be shown with a framework of metal constructed to represent a pail, the sides of which are closed up by pasting sheets of tissue paper inside and over the lower part. As before demonstrated, when a quantity of sand is poured into the pail the tissue paper casing at the bottom does not break, but if a sufficient quantity is used the sides formed of tissue paper bulge out and usually give way in consequence of the lateral pressure by the particles of sand.

The writer has made the second experiment noted, with special apparatus, and finds that with tissue paper over the bottom of a 2-in. pipe, 15 ins. long, it will stand the blow of a heavy sledge hammer, transmitted through a wooden piston, at least once and sometimes two or three times, while heavy blows given with a lighter hammer have no effect at all. That this is not due in any large measure to inertia can be shown by the fact that more than 200 lbs. can safely be put on top of the wooden piston. It cannot be accounted for entirely by the friction, as the removal of the paper allows the sand to drop in a mass. The explanation is that the pressure is transmitted laterally to the sides, and as the friction is directly proportional to the pressure, the load or effect of the blow is carried by the proportional increase in the friction, and any diaphragm which will carry the direct bottom load will not have its stresses largely increased by any greater loading on top.

The writer believes that experiments will show that in a sand jack the tendency will be for the sides to burst rather than the bottom, and that the outflow from an orifice at or near the bottom is not either greatly retarded or accelerated by ordinary pressure on top. The occurrence of abnormal voids, however, causes the sand to be displaced into them.

The important consideration of this paper is that all the experiments and observations noted point conclusively to the fact that pressure is transmitted laterally through ground, most probably along or nearly parallel to the angles of repose, or in cases of rock or stiff material, along a line which, until more conclusive experiments are made, may be taken as a mean between the horizontal and vertical, or approximately 45°. There is no reason to believe that this is not the case throughout the entire mass of the earth, that each cubic foot, or yard, or mile is supported or in turn supports its neighboring equivalent along such lines. The theory is not a new one and its field is too large to encompass within the limits of a single paper, but for practical purposes and within the limited areas to which we must necessarily be confined, the writer believes it can be established beyond controversy as true. Certain it is that no one has yet found in ground free from water pressure or abnormal conditions any evidence of greater pressure at the bottom of a deep shaft or tunnel than that near the surface. Pressures due to the widening of mines beyond the limits of safety must not be taken as a controversion of this statement, as all arches have limits of safety, more especially if the useless material below the theoretical intrados is only partly supported, or is allowed to be suspended from the natural arch.

The writer believes also that the question of confined foundations, in contradistinction to that of the spreading of foundations, may be worthy of full discussion, as it applies to safe and economical construction, and he offers, without special comment the following observations:

He has found that in soft ground results are often obtained with small open caissons sunk to a depth of a few feet and cleaned out and filled with concrete, which offer much better resistance than spreading the foundation over four or five times the equivalent area.

He has found that small steel piles and coffer dams, from 1-ft. cylinders to coffer dams 4 or 5 ft. square, sunk to a depth of only 1 or 2 ft. below adjacent excavations in ordinary sand, have safely resisted loads four or five times as great as those usually allowed.

He believes that short cylinders, cleaned out and filled with concrete, or coffer dams of short steel piling with the surface cleaned out to a reasonable depth and filled with concrete horizontally reinforced, will in many instances give as good results as, and in most cases very much better than, placing the foundation on an equivalent number of small long piles or a proportionately greater spread of foundation area, the idea being that the transmission of pressure to the sides of the coffer dam will not only confine the side thrust but will also transfer the loading in mass to a greater depth where the resistance to lateral pressure in the ground will be more stable; that is, the greater depth of foundation is gained without the increased excessive loading or necessity for deep excavation.

As to the question of the bearing value and friction on piles, the writer believes that, while the literature on engineering is full of experimental data relating to friction on caissons, there is little to show the real value of friction on piles. The assumption generally made of an assumed bearing value and the deduction therefrom of a value for the skin friction is fallacious. Distinction also is not made, but should be clearly drawn between skin friction pure and simple on smooth surfaces and the friction due to pressure. Too often the bearing value on irregular surfaces as well as the bearing due to taper in piles, and lastly the resistance offered by binding, enter into the determination of so called skin friction formulas. The essential condition of sinking a caisson is keeping it plumb; and binding, which is another way of writing increased bearing value, will oftentimes be fatal to success.

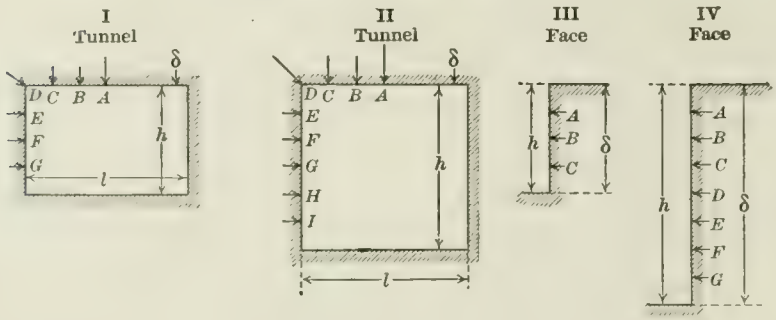
The writer believes that a series of observations on caissons sunk plumb under homogeneous conditions of ground and superficial smoothness will show a proportional increase of skin friction per square foot average for each increase in the size of caissons, as well as for increase of depth in the sinking up to certain points, where it may finally become constant, as will be shown later. The determination of the actual friction or coefficient of friction between the surface of the pile and the material it encountered is not difficult to determine. In sand it is approximately 40 per cent of the pressure for reasonably smooth iron or steel, and 45 per cent of the pressure for ordinary wood surfaces. If, for instance, a long shaft be withdrawn vertically from molding sand, the hole may remain indefinitely as long as water does not get into it or it does not dry out. This is due to the tendency of the sand to arch itself horizontally over small areas. The same operation cannot be performed on dry sand, as the arching properties, while protecting the pile from excessive pressure due to excessive length, will not prevent the loose sand immediately surrounding the pile from exerting a constant pressure against the pile, and it is of this pressure that 45 per cent may be taken as the real value of skin friction on piles in dry sand.

In soft clays or peats which are displaced by driving, the tendency of this material to flow back into the original space causes pressure, of which the friction will be a measured percentage. In this case, however, the friction itself between the material and the clays or peat is usually very much less than 40 per cent and it is for this reason that piles of almost indefinite length may be driven in materials of this character without offering sufficient resistance to be depended on, as long as no good bearing ground is found at the point.

If this material is under water and is so soft as to be considered semi-aqueous, the pressure per square foot will increase in diminishing proportion to the depth, and the pressure per area will soon approach and become a constant, due to the resistance offered by the lateral arching of the solid material, whereas in large circular caissons or caisson shafts where the horizontal arching effect is virtually destroyed or at least rendered noneffective until a great depth is reached, the pressure must necessarily vary under these conditions proportionately to the depth and size of the caisson in semi-aqueous material. On the other hand, in large caisson shafts, especially those which are square, the pressure at the top due to the solid material will also increase proportionately to the depth, as already explained in connection with the pres-

*"Discoveries and Inventions of the Nineteenth Century," by Robert Routledge, Assistant Examiner in Chemistry and in Natural Philosophy to the University of London.

TABLE 1.—Pressures on Typical Structures Under Varying Assumed Conditions.



Key to Table of Pressures, etc.

h = exterior height, l = exterior width,

δ = depth of cover, that is, D_E = earth, and D_W = water depth,

ϕ = angle of repose, and, for tunnels $D_W > D_E >$ a depth

$$= \frac{l}{2}\left(45° + \frac{\phi}{2}\right)$$

W_E = weight of 1 cu. ft. of earth = 90 lb.; W_W = weight of 1 cu. ft. of water = 62½ lb.

Conditions: 1 = normal sand, 2 = dry sand, 3 = supersaturated firm sand with no voids, 4 = supersaturated semi-aqueous material, 60% aqueous, that is, 60% water and aqueous material.

Combined assumed conditions.	h	l	ϕ	D_E	Combined assumed conditions.	h	l	ϕ	D_E	D_W

sure of earth against sheeting and retaining walls.

The writer believes that the pressure on these surfaces may be determined with reasonable accuracy by the formulas already given in this paper, and with these pressures, multiplied by the coefficient of friction determined by the simplest experiment on the ground, results may be obtained which will closely approximate the actual friction on caissons at given depths. The friction on caissons, which is usually given at from 200 to 600 lbs. per sq. ft., is frequently assumed to be the same on piles 12 ins. or less in diameter, whereas the pressures on these surfaces, as shown, are in no way comparable.

The following notes and observations are given in connection with the skin friction and the bearing value of piles:

The writer has in his possession a copy of an official print which was recently furnished to bidders in connection with the foundation for a large public building in New York city. The experiments were made on good sand at a depth of approximately 43 ft. below water and 47 ft. below an adjacent excavation. In this instance a 16-in. pipe was sunk to the depth stated, cleaned out, and a 14-in. piston connected to a 10-in. pipe was inserted and the ground at the bottom of the 16-in. pipe subjected to a loading approximating 28 tons per sq. ft. After an initial settlement of nearly 3 ins. there was no further settlement over an extended period, although the load of 28 tons per sq. ft. was continued.

In connection with some recent underpinning work, 14-in. hollow cylindrical piles 6 ft. long were sunk to a depth of 6 ft. with an ordinary hand hammer, being excavated as driven. These piles were then filled with concrete and subjected to a loading in some cases approximating 60 tons. After a settlement ranging from 9 to 13 ins. no further settlement took place, although the loading was maintained for a considerable period.

In connection with some other pile work, the writer has seen a 10-in. pipe, ⅜ in. thick, 4 ft. below the bottom of an open cylinder, at a depth of about 20 ft., sustain in gravel and sand a load approximating 50 tons when cleaned out to within 2 ft. of the bottom.

He has seen other cylindrical piles with a bearing ring of not more than ¾ in. resting on gravel at a depth of from 20 to 30 ft., cleaned out practically to the bottom, sustain a measured load of 60 tons without settlement.

As to skin friction in sand, a case came under his observation wherein a 14-in. hollow cylindrical pile which had stood for 28 days at a depth of about 30 ft. in the sand, was cleaned out to its bottom and subjected to hydraulic pressure, measured by a gage, and sunk 2 ft. into the sand without any pressure being registered on the gage. It should be explained, however, that the gage could be subjected to a pressure of 250 lbs., equal to a total pressure of 7,000 lbs. on the piston of the jack without registering, which corresponded, assuming it all as skin friction, to a maximum of not more than 78 lbs. sq. ft., but it should be noted that this included bearing value as well, and that the pressure was very far from 7,000 lbs. in all probability at the beginning of the test.

In the case of the California stove pipe wells driven by the Board of Water Supply on Long Island, the writer is informed that one of these tubes, 12 ins. in diameter, was sunk to a depth of 850 ft. In doing this work the pile was excavated below the footing with a sand pump and was then sunk by hydraulic pressure. Assuming the maximum capacity of the jacks at 100 tons, which is not probable, the skin friction could not have amounted to more than 75 lbs. per sq. ft. It cannot be assumed in this case that the excavation of the material below the pile relieved the skin itself of some of its friction, as the operation consumed more than 6 weeks, and even if excess material was removed it is certain that a large percentage of it would have had time to adjust itself before the operation was completed.

In connection with this, the writer may call attention to the fact that piles driven in silt along the North River and in soft material at other places are sometimes 90 ft. in length, and even then do not offer sufficient resistance to be depended on for loading. This is due to the fact that the end of the pile does not bear in good material.

The writer believes that the foregoing notes will show conclusively that the factor to be sought in pile work is bearing value rather than depth or skin friction, and however valuable skin friction may be in the larger caissons, it cannot be depended on in the case of small piles, except in values ranging from 25 to 100 lbs. per sq. ft.

Table I gives approximate calculations of pressures on two types of tunnels and on two heights of sheeted faces or walls, due to four widely varying classes of materials.

of

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The principal feature of railroad construction work of the week appears to be the announcement that the Canadian Northern interests were taking bids for the construction of the Duluth, Winnipeg & Pacific Ry., a 75-mile line to extend from Virginia, Minn., to Duluth, Minn. Another railroad construction contract which it appears likely will be let soon is for the construction of the steam line of the New York, Westchester & Northern R. R. to connect New York city and Danbury, Conn.—Official announcement has been made that the Canadian Northern Ry. has obtained $50,000,000 in the British money markets for development purposes.—Among the railroad construction contracts let recently were the following: John H. Dobbing, York, Pa., for grading for the extension of the Hanover & McSherrytown Street Ry. from McSherrytown, Pa., to Conewago Chapel; McCann Bros., Murphysboro, Ill., for constructing the 12-mile line of the Oil Belt Traction Co. between Bridgeport and Oblong, Ill.; Thompson & Scott, St. Louis, Mo., for the grading work for the 32-mile extension of the Stephensville North & South Ry. (Cotton Belt) from Hamilton to Gatesville; Warren Construction Co., Chicago, Ill., for the construction of car shops at Beech Grove, Ind., for the Big Four Ry.; Dan Sweeney & Co., Oklahoma City, Okla., for the grading work for the first 13 miles of line for the Oklahoma Public Service & Interurban Lines of Stillwater, Okla., and the M. B. Ryan Bridge Co., Shawnee, Okla., for the bridges and culverts; Somerset Construction Co., Somerset, Pa., subcontract from the Carter Construction Co. for about 6,000 cu. yds. of concrete work at Meyersdale, Pa., and H. E. Nay, Roanoke, Va., for 5,000 cu. yds. of concrete work near Confluence, Pa., both on the Western Maryland R. R. extension; A. B. Corey Construction Co., Ogden, Utah, for constructing of sidings and double track extensions on the Southern Pacific; Morrison & Clark, Summerside, Prince Edward's Island, Canada, $200,000 contract for revision work on the Intercolonial Ry. near Chatham, N. B.; Thrasher & Gunter, Chatanooga, Tenn., for constructing nine miles of line for the Nashville, Chattanooga & St. Louis Ry. between Wauhatchie and Whiteside, Tenn.; Herman W. Tapp Construction Co., Fort Wayne, Ind., for the track elevation work of the Pennsylvania R. R. in Fort Wayne.—Bids for two large barge canal contracts were opened May 24 by the state superintendent of public works at Albany, N. Y., H. S. Kerbaugh, Inc., Philadelphia, Pa., at $1,990,000 being the lowest bidder for contract No. 63, which calls for work between the Wayne-Monroe county line and Kings Bend west of Pittsfield. E. M. Graves, Cleveland, O., at $767,467, was the low bidder for contract No. 73, which calls for dredging the Hudson River from Stillwater to Northumberland, N. Y.

The History of the Term "Engineer."

It will be interesting doubtless to many followers of the engineering profession to know how the term "engineer" originated. In the appendix to the presidential address of Jas. C. Inglis, president of the Institution of Civil Engineers of Great Britain, considerable light is thrown on the subject. According to this the word engineer originated from an ancient French verb *s'ingenier*, and an engineer, according to the strict derivation of the term, is not necessarily a person "who has to do with engines, but any one who seeks in his mind; who sets his mental power in action, in order to discover or devise some means of succeeding in a difficult task he may have to perform." In the early use of the term, an engineer was, according to the most common acceptance of the term, a person in military service, whose business it was not only to direct warlike engines or weapons (a duty transferred at a later period to the artillery officer), but to undertake the design and construction of fortifications, siege works, roads, bridges, buildings, machinery, and all other works for military service which required knowledge, experience, and skill in the arts of construction. Down to a recent period the title "Engineer" was never applied to the constructors of similar works in civil life, yet the construction of such works generally has existed from time immemorial. Perhaps the earliest example of a definite class of persons expressly devoting themselves to civil works of an engineering character was the association known as the "Freres Pontiers" (Brethren of the Bridge), which was organized in France about the twelfth century for the purpose of building bridges wherever rivers were dangerous or difficult to ford. Branches of this association extended over all parts of northern Europe and great numbers of important works were executed, some of which still exist. In the twelfth century also the Italian republic began to improve its rivers, and the work was continued for many years. But about the commencement of the seventeenth century the great rivers in the north of Italy appear to have relapsed into a very bad condition and disastrous inundations resulted. The most learned scientific men of the day were consulted as to how the evils might be remedied. As a result valuable theoretical and experimental studies, which lasted for a century and a half, and ultimately formed a thorough basis for hydraulic science and practice, were conducted. The knowledge thus acquired spread rapidly throughout Europe and gave a great impulse to hydraulic operations. A new class of practitioners, apart from the architects, were called for, who should devote their attention to hydraulic constructions, with all their necessary mechanical arrangements; and with these soon became associated constructive works which did not embody the artistic element, and might therefore be fairly dissociated from the profession of the architect. Thus the new class of men undertook to design not only river and hydraulic works, but roads, bridges, docks, harbors, mills, and machinery, and massive buildings generally. Such a class required a new name, and this was easily found. It could not fail to be noticed that the kind of work undertaken by these practitioners was exactly analogous to that allotted to the "engineers" of the military service, and the new profession therefore adopted the same title, prefixing, however, the word "civil," to indicate that they were civilians and so to distinguish them from their military brethren. Hence the origin of the term civil engineer, its true meaning being a person who devotes himself to occupations of the kind originally practiced by military engineers, but who belongs to the civil and not to the military community. It is probable that Smeaton was the first civil practitioner (if not absolutely, at least in England), who formally denominated himself an "engineer." A report he made, dated July 11, 1761, on a canal in Staffordshire, is entitled: "Report by John Smeaton, engineer, concerning the practicability, etc., of a navigable canal . . . as projected by Mr. James Brindley, engineer."

The Chinese Canalization Systems.

The Chinese, the oldest farmers in the world, have their systems for irrigating their rice fields so well developed and scientifically arranged that it is a pretty nimble raindrop that gets away from them. Some idea of the magnitude and complexity of the systems of canalization which have been constructed in China is given by Prof. F. H. King of the agricultural department of the University of Wisconsin in a recent study of the soil and crops and people of the far eastern countries.

While passing by houseboat through the Chekiang province from Shanghai to Hangchow he made a careful record of the number and width of laterals leading into the Grand Canal on one side and out from it on the other, and found in 57 miles of the 117 miles no less than 134 having an average water surface width of 22 ft. on one side and 190 with an average width of 19 ft. on the other. This is a mean of nearly three canals to every mile traveled, cutting the field on either side. The canals were from 6 to 10 ft. or more in depth, and the soil removed has been leveled back over the fields, leaving no sign of excavated earth.

Blackwell vs. Hill.

A. F. Blackwell, builder and president of the Idaho & Washington Northern R. R., is noted for being somewhat "sot" in his ways: when he makes up his mind to do a thing he usually goes ahead and does it. Blackwell began by making money in timber lands and he made so much of it that he decided that he could afford to build some railroads. So he started in, as Spokane people think, merely to show how well a railroad could be built. He built the first interurban line from Spokane, sold it to the Hill interests, and then built the Idaho & Washington Northern Ry. Last summer James J. Hill was in Spokane and met Blackwell. "I understand you intend building a railroad down the Pend Oreille River," was his greeting. "I do," replied Blackwell. "But I plan to build a branch of the Great Northern down there," said Hill. "Then there'll be two roads," was the reply. And Blackwell built his road.

The Franklin & Lewisburg R. R., of Williamson County, Tenn., has been incorporated with a capital stock of $10,000 and proposes the construction and operation of a line. The incorporators are: J. J. Covington, E. E. Green, S. D. Beel, R. A. Bailey, Jr., B. H. Paschall, J. E. Short, Jolen H. Truett, O. E. Cox and J. A. Pierce.

Commercial Club of Harlan, Ky., have succeeded in raising the bonus necessary to insure the construction of the Wasioto & Black Mountain R. R., from Poor Fork to that city.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ARKANSAS.

The Pine Bluff & Northern R. R. has been incorporated and will build a line from Pine Bluff, Ark., to Searcy, Ark., a distance of 80 miles. Walter J. Miller, Lamar, Mo., is president.

The city council of Hope, Ark., has not as yet granted a franchise for a street railway for the city. J. H. Black, Jr., Texarkana, Ark., is the applicant. Work on the road will not be started before six months after the franchise is granted.

The Walsh Construction Co., Davenport, Ia., has sub-let part of the work of double-tracking the Missouri Pacific Ry. between McAlmont and Bald Knob, Ark., to Ball & Peters. The double-tracking contract involves 2,000,000 cu. yds. of earth and rock excavation.

Ball & Peters, Southern Trust Bldg., Little Rock, Ark., have contracts for second track work on the St. Louis, Iron Mountain & Southern Ry. at White River and Diaz, Ark., Poplar Bluff and Harviell, Mo., and team work Little Rock to Bald Knob, Ark. The contract involves 300,000 cu. yds. of earth excavation. About one-half of the work is steam shovel, which is covered by Ball & Peters' outfit. The balance is team work and will be sublet. Part of the latter is already covered.

IDAHO.

Regarding the projected new line of the Oregon Short Line R. R. from Saline to Burley, Idaho, we are advised that preliminary surveys have been made and a company incorporated; no work has yet been authorized on the line.

IOWA.

The Waterloo, Cedar Falls & Northern R. R. has indefinitely postponed the work of double tracking its line at Waterloo from Broadway to Electric Park.

MICHIGAN.

The Boyne City, Gaylord & Alpine R. R., W. H. White, president, Boyne, Mich., has surveys under way east of Gaylord for new construction work, but does not expect to let any contracts.

MONTANA.

The construction of an electric railway from Butte to Anaconda, passing through Geyser Springs, is proposed. The projected length of the line is 28 miles. Surveys have not been made as yet, and the date for awarding construction contracts is indefinite, as not all of the construction capital has been secured. Samuel Barker, Jr., Butte, Mont., is chief engineer. I. A. Heilbronner, Butte, Mont., is interested.

The Eastern Montana Electric Ry. Co. has made application to the city council of Billings, Mont., for a 50-year franchise and the same has been acted upon favorably by the city council and referred to the tax payers, to be voted on at a special election in the near future. The company has already received and accepted long time franchises from the cities of Red Lodge, Bridger, and Laurel, Montana. One-third of the location work has already been completed and right of way men are now in the field taking up the rights of way. The tonnage and traffic reports thus taken from the data received from the men in the field, who have as yet covered but one-half of the territory contiguous to this line, show earnings double the amount estimated for the entire line at the time of its preliminary presentation. F. A. Kesselhuth, Billings, Mont., is chief engineer.

NEBRASKA.

The Commercial Club of Norfolk, Neb., has taken up the matter of promoting an interurban line from Norfolk to Newmans Grove, Neb., and is meeting with much encouragement. An engineer has been over the proposed route and pronounces it excellent. L. P. Pasewalk is secretary of the Commercial Club.

NEW MEXICO.

We are advised that the Mountain, Valley & Plains R. R. Co. has no plans for extension of its line beyond Cimarron, N. M., but is bending all of its energies in the direction of completing the construction of the road from Guthrie, Okla., to Cimarron, N. M. H. S. Wannamaker, Amistad, N. M., is general manager.

OKLAHOMA.

The Oklahoma Public Service & Interurban Lines, of Stillwater, Okla., has awarded the contracts for the construction of the first section of 13 miles to Dan Sweeney & Co., Oklahoma City, for the grading work, and to M. B. Ryan Bridge Co., Shawnee, Okla., for the bridges and culverts. Surveys are under way for 85 additional miles of line and the company will be ready for bids in 60 or 90 days. The company will also be in the market in about 60 days for supplies, equipment, etc. R. G. Sturgeon, Stillwater, Okla., is chief engineer.

PENNSYLVANIA.

The Norristown Transit Co. has applied to the council of Norristown for a franchise to build a trolley line through the city. If this franchise is granted the road will be built to connect with the Philadelphia & Western near Bryn Mawr in one direction and to connect with the Lehigh Valley Transit Co. in the other direction. If the franchise is not granted in Noristown the line will be built around the city and connected to the Lehigh Valley line. The ordinance has passed two readings in the council and will come up for a third reading about June 15.

TENNESSEE.

We are advised that there is no definite assurance that the Greenville & Knoxville Ry. Co. will extend its line to Knoxville, Tenn. However, the outlook for the extension is decidedly encouraging, but some two or three months will be required to reach a definite conclusion. The towns and counties along the proposed line—through North Carolina particularly—are very anxious for the extension and have been sending delegations to the company promising to make liberal town and county subscriptions, provided the line is extended, and these matters are now under consideration, but have not reached a conclusive point. If the aid promised should be extended in a definite way and of satisfactory amount, the extension will be made.

TEXAS.

The Gainesville, Oklahoma & Western Ry. is now ready to let contracts for 20 miles of its line. Location surveys for 12 miles of this have been completed and the rest will be finished by the time the contractors are ready to move onto the work. This work will require about 13,000 cu. yds. of earth excavation and embankment per mile. There will also be required about eight pile trestles varying in length from 56 ft. to 280 ft. F. B. Truax, Gainesville, Tex., is chief engineer.

WASHINGTON

The Mount Adams Ry. Co. has completed surveys for the first 20 miles of its projected line and has secured $100,000 for construction purposes. Construction contracts will be let about July 1. The projected length of this line is 40 miles and the route is from White-Salmon Station on the North Bank R. R. to Glenwood, Wash. Rudolph Lauterbach, White Salmon, Wash., is president.

Power Developments, Levees, Drainage and Irrigation Works.

CALIFORNIA.

The Sacramento Valley Irrigation Co., Willows, Cal., has let the contract for a part of the reconstruction of its Central Canal to J. M. Kearth of Colusa, Cal., the contract calling for 370,000 yds. of reconstruction, at 17 cts., and to John Laugenour of College City, Cal., 235 cu. yds. of new construction, at 14¾ cts. per cu. yd., with a bonus for completion on time; 200,000 yds. have also been let to three other parties in small lots. In about two months the company will be prepared to let the several contracts for lateral and drain construction on the "Delevan Unit," which will amount to about 1,200,000 yds.

INDIANA.

As noted in our last issue, bids ore being asked until 10 a. m., June 20, by Maj. Thos. H. Rees, U. S. engineer, 508 Federal Bldg., Chicago, Ill., for constructing concrete superstructure, pile clumps and interlocking steel sheeting in Michigan City, Ind. The work to be done consists of driving a line of interlocking steel sheeting about 240 ft. in length (or longer, if available funds permit), parallel to and outside of the breakwater and around the northeasterly end, as directed. Placing two clumps of piles at the northeasterly end of the breakwater and placing riprap around them. Removing the decking, the top course of the side timbers and cross-ties of the new (northeasterly) crib (100 ft. long by 30 ft. wide) of the breakwater and constructing, on a foundation prepared therefor, a concrete superstructure. The following are the approximate quantities: 250 lin. ft. interlocking steel sheeting, 26 white oak or pine piles, 50 ft. long, 360 lin. ft. 1-in. wire rope, 150 galvanized staples, 4 in. long, 60 cords riprap, 128 cu. ft. each, 660 cu. yds. concrete, 150 cu. yds. spall or gravel for foundation, 3,300 lbs. steel rods, 350 lbs. steel drift bolts, 280 lbs. steel screw bolts, 70 lbs. eye bolts with mooring rings, 3,300 ft. B. M. pine timber, 700 ft. B. M. oak plank, 500 lbs. 8-in. wrought iron spikes, 100 lin. ft. foundation to be prepared, 20 hours use of dredge, if required.

IOWA.

N. C. McGinnis, Bement, Ill., has been awarded the contract for constructing joint Drain No. 70, Webster county, Ia., and Drain No. 95 in Calhoun county, Ia., bids for which were opened May 23, at Rockwell City, Ia. The contract prices were as follows: 6.11 cts. per cu. yd. for the main line; 7 cts. per cu. yd. for Sec. 2, Branch No. 4, and 7 cts. per cu. yd. for Sec. 9, Branch No. 1. The work includes the following: Sec. 1, main line—46,400 cu. yds., 26-ft. bottom; 36,300 cu. yds., 20-ft. bottom; 38,400 cu. yds., 18-ft. bottom; 236,500 cu. yds., 12-ft. bottom; 50,900 cu. yds., 8-ft. bottom; 30,925 cu. yds., 6-ft. bottom; 58,450 cu. yds., 5-ft. bottom. Sec. 2, Branch No. 4—102,204 cu. yds., 5-ft. bottom. Sec. 9, Branch No. 1—23,000 cu. yds., 5-ft. bottom.

LOUISIANA

Contracts for levee work in the Fifth Louisiana Levee District, bids for which were opened May 25 at New Orleans, La., have been let as follows: Wilson Point levee, 50,000 cu. yds., T. S. Shields, Greenville, Miss.; Elton levee, 100,000 cu. yds., and Wyley to Hollybrook levee, 190,000 cu. yds., Hercules

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

(Confirmed Reports, Continued.)

Co., Ltd., 407 Cotton Exchange Bldg., New Orleans, La.; Wilton levee, 100,000 cu. yds., Helgason Bros., Vicksburg, Miss.

WASHINGTON.

George Cooke & Son, 414 Columbia Bldg., Spokane, Wash., have the contract for constructing the main laterals distributing system for the Cowishe branch (Tieton unit, Yakima project). The contract includes 350,000 cu. yds. earth excavation and 35,000 cu. yds. rock excavation. The subcontractors on the work are as follows: Minney & Maxwell, George & Cady, Jas. Lineham, W. L. Carpenter, P. A. Jennings and A. Henderson & Co.

WISCONSIN.

The Great Lakes Dredge & Dock Co., Chicago, Ill., at the following bid per short ton delivered in place in the breakwater, was the only bidder, May 25, for building rubble mound breakwater at Superior Entry, Wis., for the U. S. government: Quarry run, $1.60 per ton; 10-ton and greater $1.60 per ton. The bid was recommended for acceptance.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

McCrory & Beedeville Southern Ry. Co., recently chartered with a capital stock of $100,000, proposes to build a railroad from McCrory, Woodruff county, to Beedeville, Jackson county, a total distance of 14 miles. The incorporators are as follows: Clayton Hailey, E. L. Hamilton, W. B. Fakes, G. G. McCrory, Sam Turpin, I. H. Beidleman and R. B. Keating. The company has a 50-year franchise.

J. C. Knox, Monticello, Ark., general attorney for the Arkansas, Louisiana & Gulf R. R., has filed an application with the Secretary of State for the renewal charter for the extension of the line from Pine Bluff, Ark., to Hazen. The company of which J. M. Parker is president has about 66 miles of track in operation.

Stockholders of the Memphis, Paris & Gulf Ry. are considering a proposition to increase the capital stock from $640,000 to $6,260,000 and issue bonds for the extension of the present trackage from Murfreesboro, Ark., to Memphis and Ashdown, Ark., and Texas. It is also believed that the name of the company will be changed to the Memphis, Dallas & Gulf.

Work has been commenced by Ball & Peters, Little Rock, Ark., contractors, who have a construction contract for double track on the Iron Mountain between White River bridge and Diaz. About 150 men are employed on the job.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

In response to the demand of residents of the Sunset District the Board of Supervisors of San Francisco have adopted a resolution granting a street railway franchise commencing at Third and Parnassus avenues, along Third avenue to Judah street, thence to Ninth avenue to Pacheco street. It is understood that the residents of the Sunset District have raised $20,000 to induce the United Railroads to build the desired extension.

Advices from Wengler state that the Mount Shasta Power Co. has put in air compressors for drilling its seven-mile tunnel, which is to convey 250,000 ins. of water from Pitt River across the "Big Bend" and deliver it at an elevation where it will generate 100,000 hp. of electric energy. Work on the tunnel has been under way for some time.

The Highland Pacific R. R. Co. is reported to have been financed by San Francisco capitalists. The company is to build a standard-gage railroad from Santa Rosa via Alexander Valley, Highland Springs and Lakeport to Upper Lake. Dr. A. E. Dickinson of San Jose is president.

The Southern Pacific Ry. is planning to shortly rebuild its wharf at Newport Beach. About 100 ft. will be taken off the end of the wharf.

Construction work on the electric line of the Central California Traction Co. of San Francisco, between Sacramento and Stockton, is going forward rapidly. Three miles of piling and bridge work across the Cosumnes River and lowlands has been completed. The track bed has been ballasted in the neighborhood of Oak Park, and the track on 8th St., Sacramento, between J and L, has been completed.

Farmers in the vicinity of Greenview have appointed a committee consisting of Fred Smith, Mike Marlahan and Frank Jenner to arrange plans for straightening Scott River, starting at a point almost east of Etna, and running to the bridge near Fort Jones, a distance of some six miles. They propose to purchase a dredger and cut, as nearly as possible, a straight line down the center of the valley, purposing to protect the rich valley lands from the yearly floods. The promoters propose to bond the district for $30,000 or more to erect a dredger and carry on the reclamation work.

Advices from Sacramento, Cal., state that H. A. McClelland of the Mercantile Trust Co. of that city has filed a deed with the County Recorder for a broad right of way sufficient for the accommodation of a double track over certain streets in Elmhurst.

Reports from Nevada county, California, are to the effect that work will soon be commenced on the line of the California Midland Road and that the line will run from Grass Valley to Auburn by way of Marysville, Cal. Bonds are said to have been disposed of in foreign markets to provide funds for the project.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The San Luis Power & Water Co., with a capitalization of $1,000,000, has filed articles of incorporation in New Mexico, the incorporators being H. Alexander Smith, Geo. Bierbrauer and Michael B. Hurley of Colorado Springs, Colo. The New Mexico offices are at Costilla, Taos county, and the directors are Franklin E. Brooks, Gerald Hughes, Fred Hughes Fred. C. Moffat, Horace G. Lunt and H. Alexander Smith. The company will operate in El Paso and Costilla counties, Colorado, and Taos county, N. M.

The Denver, Greeley & Northwestern R. R. Co. has been incorporated with a capital stock of $2,700,000. The new company, which is a merger of the holdings of the Denver, Greeley & Fort Collins and the Northern Colorado Railway & Utility Companies, plans the construction of a railroad from Denver, Colo., to Greeley, with telephone, telegraph, electric light and electric power transmission lines. The incorporators are A. W. Trenholm, a prominent railroad man of Minnesota; Otto Bremer, former treasurer of St. Paul, Minn.; C. McC. Reeve, a wealthy resident of Minneapolis; J. R. Hutchison, formerly auditor of the Denver, Laramie & Northwestern and now connected with the University of Wyoming; Ralph Hartzell, formerly assistant United States district attorney; Edward W. Genter and George L. Nye, wealthy residents of Denver; George J. Spear, C. H. Ramsey and H. E. Churchill of Greeley.

Contracts will be let soon for the construction of 51 miles of double track between Pueblo and Walsenburg, Colo., to be built jointly by the Denver & Rio Grande and Colorado & Southern Railroads at a cost of $5,400,000. Plans for the work have been approved by the companies interested. W. A. Balcom is division engineer of the Denver & Rio Grande at Pueblo, Colo.

The State Land Board at Denver has been petitioned for the immediate segregation of 280,000 acres of land in Rio Blanco county, which were to have been irrigated by the White River irrigation project which was abandoned by the U. S. government. Four large irrigation companies are now contesting for the privilege of taking up and carrying to completion the project. At the recent hearing the claimants appearing before the State Board were the Maggenheimer syndicate, represented by Attorneys C. D. Hayt and C. S. Thomas; the White River & Trappers' Lake Reservoir Co., represented by Dorsey & Hodges; the Northwestern Canal & Reservoir Co., represented by H. H. Clark, and a fourth company represented by E. G. Kindred. The first three claimants have parallel systems, each one of their filings appropriating the full measure of water from White River needed for the irrigation of 288,000 acres. The fourth company has a different water shed, and its plans do not conflict materially with the plans of the other three.

The Southern Colorado Reservoir & Irrigation Co. has been incorporated with a capital stock of $1,000,000, David W. Brunton, Zeph C. Felt, Arthur Ponsford and Edward S. Worrell, Jr., being the incorporators. The company plans to irrigate thousands of acres of arid land in the San Luis Valley. Work will be started within the next two months. The headquarters will be in Denver and offices will soon be opened.

Advices from Holly state that the organization of the Monmouth Irrigation District has been unanimously authorized by residents of northern Prowers and southern Kiowa counties. The project will cost $4,000,000 and when completed will add 120,000 acres to the productive irrigated land of the Arkansas valley. The land to be reclaimed lies north of Hartman and Bristol. It will be watered from the Monmouth reservoir and by the use of unappropriated water from the Purgatoire and Arkansas Rivers. Among the men behind the enterprise is A. E. Bent, former state treasurer.

The signing of joint track operation contracts by the Denver & Rio Grande, the Colorado & Southern and the Santa Fe for the operation of tracks between Denver and Pueblo and Pueblo and Walsenburg, assures the expenditure of $1,000,000 for construction work. Signing of these agreements also practically assures that a double track will soon be maintained due south from Denver a distance of 170 miles. The Denver & Rio Grande, the Colorado & Southern and the Santa Fe have entered into an agreement to jointly operate the tracks from Denver to Pueblo while the Denver & Rio Grande and the Colorado Southern have contracted for the joint construction of a track from Pueblo to Walsenburg.

Engineers of the Union Pacific R. R. have been laying out the new yards for the road at Fort Collins, which will require the construction of more than 12,000 ft. of trackage within the city limits.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

William Ashton, Salt Lake City, Utah, chief engineer Minidoka & Southwestern R. R. (Oregon Short Line), has filed plats, officially adopted May 13, by the directors of the company in the United States Land Office, showing the definite location of the Buhl-Nyssa extension across Southern Idaho. The general route of the new line will be from Buhl, Idaho, northwesterly along the Snake River through Bruneau-Twinn Falls tract,

Bruneau and Grand View, thence west along the south bank of the Snake River to Nyssa.

The Pittsburg & Gilmore R. R., now under construction from Armsted, Mont., into Lemhi county of Idaho, is, it is thought, planned by James J. Hill to form a link of the new transcontinental route from St. Paul to San Francisco, Cal. Board of directors of the company have filed resolutions of intention to construct from Armstead to Dillon, and from Dillon, Mont., into Butte and from Dillon into Whitehall. The estimated cost of this work is $1,500,000.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Evansville, Mount Carmel & Olney Interurban Co. has been incorporated with a capital stock of $30,000 and principal offices at Mount Carmel. The company proposes to construct a line from the Wabash River in Mount Carmel, Ill., to Olney, Ill., through counties of Wabash, Lawrence and Richland. The incorporators and first board of directors are as follows: E. Q. Lockyear, Evansville, Ind.; C. J. Seibert, Evansville, Ind.; S. J. Laubscher, Evansville, Ind.; Thomas Marvel, Cynthiana, Ind.; E. B. Bixler, Cynthiana, Ind.; Aden Knoph, Olney, Ill.; J. F. Hyatt, Olney, Ill.; James F. Seibert, Lancaster, Ill.; J. O. Smith, Lancaster, Ill.; Lewis Seitz, Mount Carmel, Ill.; Robert Parkinson, Mount Carmel, Ill.

Wallace Treichler, C. E., Rock Island, Ill., has completed the survey of the two new proposed routes for the Tri-Cities & Northeastern interurban. These routes are the Silvis-Hampton and the Silvis-Riverdale farm routes, one of which is to be substituted for the Watertown-Hampton route which was first proposed.

The Peoria, Galesburg Ry. Co., which proposes to build an interurban line between the two cities named, has again applied to the city council of Peoria for a franchise for a line on Antoinette street in that city.

The park commissioners of Decatur have asked the Decatur Railway & Light Co. to extend a street car line southwest to Lincoln park.

The Galesburg, Rock Island Traction Co. has secured about 80 per cent of the right of way for its proposed electric railway, and it is hoped to have actual construction work started by July 15. R. V. Field, Galesburg, Ill., is treasurer.

The Wabash R. R. is shortly to begin the erection of a 300-ton coaling station at Mt. Olive.

The Keithsburg Drainage District Board of Commissioners of Keithsburg have awarded the contract for levee work to Grant Smith & Co. & Locker, who have been doing the work in Boston Bay. The dredge work was let to McWilliams & McWilliams.

Pryce & Sievers, coal mine operators of Moline, owning coal property on the road between Coal Valley and Sherrard, one-half mile northwest of the county farm, are considering building an electric road from their mine to Coal Valley, a distance of 1¼ miles over the hills. The line would be used for hauling coal.

The Illinois Traction system has awarded the contract for the steel overhead bridge over the Chicago & Alton tracks out of Springfield to the McClintic-Marshall Construction Co. of St. Louis, at about $65,000. This is the bridge over the Alton tracks in connection with the building of the belt line about the city of Springfield. Piers on the bridge will cost about $8,000. The bridge, including approaches will be 2,400 ft. long.

The Burton Construction Co. of Chicago, Ill., has been incorporated with a capital stock of $10,000 and proposes to engage in general construction and contracting business and deal in construction materials. J. C. Kistler and Eber C. Chase are the incorporators.

The Chicago, Burlington & Quincy R. R. Co. has started work at Savanna, Ill., on the proposed double track between Minneapolis, Minn., and Chicago, Ill. Steam shovels are widening the roadbed between cuts, and it is expected that it will be possible to lay about 100 miles of track this summer. W. L. Breckinridge, Chicago, Ill., is engineer maintenance of way.

The Cleveland, Cincinnati, Chicago & St. Louis Ry. Co. has awarded the contract to Warren Construction Co., Chicago, Ill., for the construction of the car shops at Beech Grove, Indianapolis, Ind. The contract provides that work shall be completed by Feb. 15, 1911. The work is estimated to cost $1,000,000.

The Barous Construction Co. of Chicago has been incorporated with a capital stock of $10,000 and will engage in a general grading and excavating business. The incorporators are George H. Miller, Isadore Goldstein and Thomas W. Reilly.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Commissioners of Pike, Dubois and Gibson counties, are said to be considering plans for straightening Patoka River. The largest place to straighten is where the river leaves Marion Township to a point near Winslow, almost five miles in length and paralelling the Southern railroad track. The channel will be cut about 60 ft. at the top, 50 ft. at the bottom and 12 ft. deep, and it is claimed by the promoters that it will prevent the overflowing of about 20,000 acres of fertile land.

Reed & Tripp, South Bend, Ind., have secured a grading contract on the Santa Fe, 80 miles southeast of Kansas City, and have shipped their outfit to that place. The work will probably last until November.

The Pennsylvania R. R. has awarded the contract for its track elevation work in Fort Wayne to the Herman W. Tapp Construction Co. of Fort Wayne. The grade crossings will be eliminated by the elevation of the tracks for a distance of something more than one mile. The Wabash, which is also compelled to elevate its tracks in Fort Wayne, will do the work with its own force under the direction of W. S. Danes, engineer of maintenance of way.

The Lafayette Engineering Co., Lafayette, has been awarded the contract for the erection of a $25,000 addition to the Monon R. R. shops at Lafayette. The new shops will be equipped with six engine pits, one drop pit and five repair pits.

Harold Keith, county surveyor, Goshen, Ind., has estimated the cost of the proposed widening, deepening and straightening of Rock Run in Elkhart County at $36,669.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Rheins & Chamberlain, Des Moines, representing eastern capitalists, are promoting a project for building an interurban line from Iowa City to Des Moines by way of Williamsburg and Montezuma.

The stockholders of the Sioux City & Spirit Lake Interurban Ry. Co. have voted to complete the road at once. Frank Patch, Hartley, Ia., is president.

A project is under consideration for the construction of a 7,000 hp. electric plant on the Niobrae River, near Valentine, Neb. The project includes the construction of an interurban line from Valentine toward Sioux City, with an ultimate terminus at the latter place. The distance between the two cities is 250 miles. The W. K. Palmer Co., Kansas City, Mo., are the engineers. C. H. Cornell, president of the First National Bank of Valentine, Neb., is promoting the project.

Citizens of Ottumwa, Ia., have subscribed 12 miles of right of way and a bonus of $75,000 toward the construction of the proposed line of the Iowa City Interurban Co.

The Muscatine North & South Ry., Chas. Howard, general manager, Muscatine, has secured all right of way and all plans have been made preparatory to extending the Muscatine north and south line the 25 miles from Elrick Junction to Burlington. The road at present runs only the 30 miles between Muscatine and Elrick.

The Joint Board of Supervisors of Woodbury and Monona counties, have been over the route of the West Fork drainage ditch with a view to making a final settlement preparatory to advertising the work.

The Chicago Great Western Ry. is about to start work, it is said, on the improvement of its western division from Oelwein to Council Bluffs, from Hayfield to Clarion and the Lehigh branch. The work includes the improvement of the roadbed and the laying of new 75-lb. rails. Elzy Construction Co., Marshalltown, Ia., it is believed, will do the work. L. C. Fritch, Chicago, Ill., is chief engineer.

The Keokuk & Hamilton Water Power Co. is taking steps toward the construction of a railroad from Hamilton, Ill., to the dam site at Keokuk.

Engineers are reported to have surveys well under way for the construction of the proposed railroad from Red Oak through Greenfield and Winterset to Des Moines, Ia., a distance of 108 miles. It is said that $400,000 of stock has already been subscribed.

William McKinley, Illinois congressman, and L. E. Myers, Chicago, Ill., are reported to have opened negotiations for the purchase of the street railway in Des Moines, Ia.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Commercial Club of Conway Springs, Kan., of which J. J. Booth is president, is advocating the construction of an interurban line from Hutchinson to Arkansas Springs, passing through Conway, Wellington and Gueda Springs.

The Metropolitan Street Ry. Co. of Kansas City, Mo., is considering constructing two car line extensions in Kansas City, Kan. The Quindaro boulevard line is to be extended west to the new city limits. A cross-town line is to be built on 18th St. from Minnesota Ave. to Central Ave. The Grandview cars now run to the city park and the park board has been asked for permission to build a loop around the park. John M. Egan, president of the company, has asked the directors for an appropriation for the work.

Burns & McDonnell, consulting engineers, Kansas City, Mo., have completed plans for the new concrete dam to be built by the city of Wichita across Little Arkansas River, near Central Ave., and the city clerk is now calling for bids. The dam will cost about $22,000.

The Missouri Pacific Ry. has been making surveys with a view to cutting down Kickapoo Hill, near Leavenworth.

The laying of 90-lb. rails on the Atchison, Topeka & Santa Fe R. R., from Ottawa, Kan., through Chanute to Cherryvale, has been completed as far as Welda.

Eugene Tilleux, Hutchinson, Kan., is promoting the construction of a railroad from Wakita, on the Nashville, joining two branch lines of the Atchison, Topeka & Santa Fe Ry. The cost of the work is estimated at $150,000.

The rights of the proposed Topeka & Southwestern R. R. have been taken over by the Winnipeg, Salina & Gulf R. R., and headquarters will be opened by H. Leon Miller, president of the latter company at 627 Kansas Ave., Topeka. A direct line from Council Grove and Topeka with entrance rights to Kansas City have in that way been arranged.

Louisiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Property owners from the Mounds and Delta Districts met recently at Tallulah, La., and completed the preliminary details in the organization of Mounds District No. 1, which covers about 60,000 to 80,000 acres lying between the canal bayou district and the Mississippi River.

Officials of the Louisville & Nashville R. R. have been in conference with the engineers of the various railroads entering New Orleans with a view to reaching an amicable arrangement for the rearrangement of tracks on the river front between Canal and Poydras Sts. The Southern Pacific has recently bought an entire square of ground on which it is proposed to erect a big warehouse and the Louis-

ville & Nashville tracks are the nearest to the property.

The Lake Arthur Reclamation Co. has filed its charter at Lake Charles. The company is capitalized at $50,000. The officials are as follows: Edward S. Streator, president; Val A. Miller, vice-president; Winfield S. Streator, secretary, and John B. Ferguson, treasurer. The company will do a general reclamation and land business.

The town of Cottonport has voted a tax to assure the construction of the Gulf Belt Northwestern Ry. line through that place.

Citizens of Newton have subscribed about $25,000 for stock of the Newton Northwestern R. R. Co., which proposes to construct a railroad from Newton, Miss., through Carthage, Conehotta, Walnut Grove and other points in Leake county, Mississippi. The company has already been chartered. H. J. Majure, Newton, Miss., is interested.

The Yazoo & Mississippi Valley R. R., W. S. King, general superintendent, Memphis, Tenn., is to begin at an early date bettering the roadbed of the Baton Rouge & Hammond line. The bridges will be filled in and other work done.

Bids were opened May 25 at the office of the State Board of Engineers in New Orleans, for approximately 350,000 cu. yds. of levee work in East Carrollton Parish, contracts being let as follows: Elton Levee, 100,000 cu. yds, awarded to Hercules Co., Ltd., New Orleans, at 23 cts. per cu. yd. Levee from Wyly to Hollybrook, 100,000 cu. yds., awarded to Hercules Co., Ltd., at 22.3 cts. per cu. yd. Wilson Point Levee, 100,000 cu. yds., awarded to Helgason Bros., at 17.9 cts. per cu. yd. Those bidding on the several pieces of work were M. L. Linnan, Hercules Co., Ltd., Helgason Bros., Donovan & Daley, R. T. Clerk & Co., W. C. Mullen, J. M. Sullivan, H. F. Garbish, O. A. Gibson, J. G. Sessions, N. C. Williamson and T. S. Shields.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Business men of New Lothrop village and farmers in the vicinity of that place have raised $12,000 of the required $15,000 for the continuation of the spur railroad line from New Haven to New Lothrop, 9 miles. The spur is on the Ann Arbor R. R., 6 of the 15 miles having been completed last year. G. K. Lowell, Detroit, Mich., is general manager of the Ann Arbor R. R.

Tench & Co., contractors, who are constructing the Lansing & Flint electric line, have moved their entire outfit from Morrice to Haslett and work has been started on the last section of the grading.

The Michigan Central, according to reports, will issue bonds amounting to $1,500,000 to provide funds for the construction of double track on the Grand River Valley R. R., between Jackson, Mich., and Grand Rapids, a distance of 84 miles. R. D. Starbuck, Detroit, Mich., is assistant chief engineer of the Michigan Central.

City council of Detroit, Mich., has passed an ordinance granting the Detroit United Ry. Co. permission to construct an extension of the Third Ave. line to the city limits on Hamilton Blvd.

Active steps are being taken toward the construction of the proposed line of the Flint, Fenton & Ann Arbor R. R. As projected the route will be through Brighton and Hartland, Mich.

Surveys have been completed by the engineers of the Grand Trunk Ry. for the construction of the proposed line from Saginaw, Mich., to Ashley on the Ann Arbor, a distance of 28 miles. T. T. Irving, Detroit, Mich., is resident engineer of the company.

Representative of the Wabash Ry. is reported to be securing right of way for the construction of a double track from Detroit to Adrian, Mich.

The city of East Lansing held an election May 31 to vote on the question of the confirmation of the granting of a franchise by the common council of the city of East Lansing to the Detroit, Lansing & Grand Rapids Ry. This is one of the last franchises that the railway will have to secure for its projected electric line.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chicago, Milwaukee & St. Paul Ry. is said to have surveys under way for a cut-off line in Minnesota which would cut down the running time on its Pacific Coast line. The surveyors have started at Hutchinson, present terminus of a 14-mile branch from the H. & D. line at Glencoe, 51 miles west of Minneapolis. Their destination is said to be Appleton, 144 miles west of Minneapolis by the present line.

According to advices from Hutchinson, Minn., engineers are busily engaged in running lines for an electric railway from Minneapolis, through Watertown, Winsted and Northern McLeod counties.

The Mackenzie & Mann syndicate has called for bids for the construction of the Duluth, Winnipeg & Pacific Ry. from Virginia, Minn., to Duluth, Minn., about 75 miles. The construction of this line will give the Canadian Northern R. R. close connection with the Chicago & Northwestern Ry. at Chicago. It is understood the necessary arrangements have been made between the companies. It will also give the C. N. R. a through line from Duluth to Winnipeg and the west. As stated in our last issue, $4,700,000 has been secured by Mackenzie & Mann for the financing of this piece of construction. H. T. Hazen, 619 Lyceum Bldg., Duluth, Minn., is chief engineer.

Duluth and the Ranges.

BY PETER E. MEAGHER.

Melvin Pattison and Frank Beale of the Brown Hoisting Machinery Co., Cleveland, O., were callers at this office a few days ago. They have already started on their contract of erecting the new coal dock for the Pittsburg Coal Company at Duluth, Minn. They have a great many men already engaged on this work and will rush this dock to completion as fast as possible.

Andrew Perian of Carl Hall & Co., contractors, was a caller the other day. He reported that his firm had just secured another small contract from the Duluth & Iron Range Ry. Co., and they will start on the same immediately.

Arthur Mitchell, general superintendent for this territory for the MacArthur Bros. Co., returned from a trip to Chicago this week. He said that they had two large contracts on the Mesabe Range, and that they were working night and day crews on the same.

C. F. Haire, chief engineer of the Duluth & Northern Minnesota Ry. Co., was a caller last week. At the present time they have ten or twelve miles of work under construction.

Will Phillips, representing Taylor Iron & Steel Co., manufacturers of Tisco dipper teeth, came in to see us recently, and judging from the amount of orders that he had for teeth would say that business is very fine with him.

C. J. A. Morris of Morris & Shepard was a caller last week. He was up here looking over his three large dock contracts at this point, and left from here for his railroad work in North Dakota, and incidentally while here he purchased a 35-ton new Vulcan traction steam shovel from the writer. This shovel is to be used on his railroad work in Dakota.

J. D. O'Connell, Duluth contractor, was awarded a street contract for paving by the city of Two Harbors, which amounts to about $68,000. He will start on this work immediately.

C. E. Jameison, railroad contractor, was a visitor, and reported that he was just finishing up his contract on the Soo Line that he had taken from Foley, Welch & Stewart, St. Paul, Minn.

John Bergman, railroad contractor, who has some work on the Duluth & Northern Minnesota Ry. near Duluth, was a caller a few days ago and purchased 18 dump cars from the writer, to be used on his present contract.

A. Guthrie, the railroad contractor from St. Paul, was a visitor in Duluth a few days ago. He was up here, we understand, on business connected with his mining interests.

Dale & Bumgardner, railroad contractors, St. Paul, Minn., were awarded a very nice steam shovel contract by the Northern Pacific Ry. Co. at Staples, Minn., and have already started on the same.

Winston-Dear Co. of Hibbing, Minn., are making good progress on their 6,000,000 yd. contract that they have for stripping the Buffalo & Susquehanna Mine at Hibbing. Have already completed their big trestle and are using temporarily a large narrow gage plant until their new standard-gage plant is in operation. They will continue to run a day and night shift for a long time to come.

Pastoret-Lawrence Co., general contractors, Duluth, Minn., were callers at this office recently and purchased some equipment for their large sewer work at Rice Lake, Wis. They have already started on this contract.

H. L. Bartlett of the H. L. Bartlett Co., general contractors, was a caller and said that they were very busy at the present time.

O. A. Lewellan, general agent for the northwest for the J. I. Case Co., spent a couple of days with us here recently, looking up prospects for business in his line.

W. F. King, contractor, was a caller this week and said that he was very busy at the present time and that he was awarded another concrete contract by the Duluth & Northern Minnesota Ry. Co.

Any sub-contractors who are looking for work, or any contractors that have teams that they would like to put to work, by addressing this office will find something of interest to them. We have quite a bit of work to sub-let and will be glad to hear from any one interested.

The labor situation in Duluth at the present time is excellent. There is quite a demand for laborers, but there seems to be about enough to fill all orders. The wages have not gone up any, and I do not think they will for some little time.

Contractors and others when in this section are cordially invited to make the office of Peter E. Meagher, 409 West Michigan St., Duluth, Minn., their headquarters while here. If there is anything worth knowing, we know it and will always be glad to give all the information we can regarding this section of the country.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The St. Louis & Iron Mountain Ry. is reported to be considering moving its division headquarters from Cotter, Ark., to Crane, Mo.

The town of Philadelphia, Mo., about 12 miles northwest of Palmyra, has completed the raising of $6,000 as a bonus for the construction of the proposed Palmyra & LaPlata interurban line through the town.

The Deering Southwestern Ry., F. B. Montgomery, president, Harvester Bldg., Chicago, Ill., is to be extended into Caruthersville. The city agrees to give right of way and 20 acres for terminal purposes. The road at present is 9 miles long.

The Cotton Belt R. R. Co. is stated to have purchased three blocks of railroad property for freight depots and terminals in North St. Louis. The property is between Main and Lewis, Florida and Dickson Sts., and has a frontage of 1,000 ft. The amount paid is reported to be $1,250,000 and it is said that $2,000,000 will be spent on the improvements.

St. Louis Items.

BY A. B. KOENIG.

McCann Bros. of Murphysboro, Ill., secured the contract to building the Oil Belt Traction Co. line 12 miles between Bridgeport and Oblong, Ill. They have some nice paved way both ways on this line to let.

Costello Bros. are getting along nicely with all of their Big Four R. R. work in Indiana.

The Interstate Contracting Co. of Chicago secured a nice steam shovel contract from the Sligo Iron Co., near Sligo, Mo. It is also doing some work in Minnesota. H. Hender-

son, general manager of this company, spent a couple of days in town with us last week.

James Ward has his outfit at work at Madisonville, Ky., on the L. & N. R. R.

A. B. Koenig returned to St. Louis after a ten day trip through the west, looking over the various labor markets. Koenig visited every important city in the west during this time.

Burke Bros. are still busy with their street paving contracts in Fort Smith, Ark.

The L. J. Smith Construction Co. had to lay up one of its steam shovels, which was getting out gravel at Fort Gibson, Okla., for its ballasting contracting on the Missouri Pacific R. R., on account of the high water of the Grand River. The company expects to resume work as soon as the water in the river recedes enough to permit the shovel to get out the gravel.

The Gould system contemplates a cut-off between the main line from Riverton, Utah, and the Bingham-Garfield branch at Wellby and the Western Pacific line.

At a meeting held in Caruthersville, Mo., on May 25 between the president of the Deering & Southwestern R. R. Co. and the Commercial Club resulted in an agreement to extend the road to Caruthersville. This will greatly reduce freight rates, giving western connection with the Cotton Belt. The city agreed to secure the right of way and donate 20 acres for terminal purposes.

Within six months the Chicago, Burlington & Quincy R. R. Co. will begin work on a double track structure across the river at a point within a few hundred feet of the bridge now owned by the Chicago, Burlington & Quincy—the old Hannibal. C. R. Fickes of Chicago, engineer for the railroad company, who has been in charge of a force of men for the last two months has been taking soundings in the Missouri in the vicinity of the old bridge and making preliminary plans for the new. It is probable that the old structure will be abandoned as soon as the new bridge is ready for use. The Hannibal bridge has been in use since 1869 and no longer is considered safe for heavy railway traffic. It is now used by the Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific, the Great Western and the Wabash railways.

Davis & Blair of Joplin, who were recently awarded the contract for grading the new railroad to be built from Phillipsburg on the Frisco, 194 miles southwest of St. Louis, to Buffalo, Dallas county, have begun work with a large force of men and teams, and the task will be pushed to early completion. The new road, which will open up one of the richest sections in the state, is known as the Laclede, Dallas & Western, and is being pushed by Kansas City capital.

The state board of railroad incorporators of Arkansas on May 26 granted the Pine Bluff & Northern R. R. Co. a charter to build a road from Pine Bluff to Searcy, 80 miles. The capital stock of the company is $1,600,000. The road will connect at Searcy with the Missouri & North Arkansas at Gaynor with the Iron Mountain at McCreanor with the Rock Island and at Tucker with the Cotton Belt. The incorporators are W. J. Miller, Lamar, Mo., president; Wm. M. Kavanaugh, Little Rock, vice president; C. P. Hornwell, Little Rock, secretary and attorney; D. V. Nixon, Tucker; J. M. Gates, Lonoke; E. A. Robbins, Searcy; S. S. Jett, Carlisle; T. M. Fletcher and S. M. Savage, Lonoke; F. C. Kylo, McCreanor; C. C. Kavanaugh, Little Rock. W. J. Miller is the largest stockholder.

Senator Warner introduced a bill in the U. S. Senate on May 26 to authorize the St. Louis & Kansas City Electric Railway Co. to build a bridge across the Missouri River at or near Arrow rock. It must be located so as not to interefere with navigation.

An additional appropriation of $25,000 was asked last week by the board of public improvements for the first section of the Baden public sewer. The estimate was $256,000, but the lowest bid received was $280,157.15, from the Hoffmann-Hogan Construction Co. All other bids were rejected and the lowest bid will be held pending the appropriation; new bids will be asked. The highest bid was $355,000, just $99,000 above the estimates. The sewer is to be 18½ by 38 ft., or 475 ft., 17 by 23 for another half mile and 13 by 18 for 1,634.41 ft. The big end of the sewer is to be as wide as the roadway in the average residence street.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Advices from Missoula state that John R. Toole, president of the Blackfoot Ry., is about to award a contract for the extension of the Blackfoot line from the landing, 25 miles north, to a junction with the Blackfoot River, northeast of Clearwater postoffice. It is reported in some quarters that this contract has already been let to T. J. White of Hamilton, Mont.

Right-of-way agent of the Northern Pacific is closing up the deeds to the land which has been recently purchased for the double track between Bozeman and Logan, a distance of 25 miles. Engineers are also busy completing the final surveys and construction work, it is said, will be started as early as possible.

Advices from Libby, Mont., state that work is well underway on the extension of the railroad of the Dawson Lumber Co. Upon the completion of the new work, about 14 miles of road will be in operation.

According to a statement of John F. Stevens of Portland, Ore., president of the Oregon Trunk Line, the Pacific & Eastern, now controlled by Hill interests, will not be built immediately beyond Butte Falls. It may go to the coast in the future.

Surveys are being made by George R. Metlen, C. E., Dillon, Mont., for the irrigation reservoir to be constructed across the upper end of the lower Ruby canyon, about five miles above Alder, for the Homestead Land & Irrigation Co., which was incorporated recently for the purpose of reclaiming, under the provisions of the Carey act, a large acreage on the bench between the Beaverhead and Ruby rivers. The incorporators are Lee Mantle, A. J. Davis, Eugene Carroll and R. A. Carnochan of Butte and W. A. Clark of Virginia City. The dam, which will be constructed across the Ruby river about 12 miles southwest from Virginia City, will be 150 ft. in height and will back up the water of the river a distance of about three miles.

The Northern Pacific Ry., W. L. Darling, chief engineer, St. Paul, Minn., is reported to have received bids for the grading work for the extension of the Western Dakota R. R. from Mott, N. D., to Terry, Mont. It is stated that this work will be commenced some time this summer. The new extension will be about 225 miles long, which, together with the Mott branch of the Western Dakota R. R., will make about 350 miles of new track for the N. P. The total cost of building the lines north to Stanton, south to Fort Yates and from Cannon Ball west to Mott is estimated at about $12,500,000. It is said that the extension from Mott to Terry will cost as much or more, as part of the right of way runs through the Bad Lands.

Donald McIntosh, Milwaukee, Wis., contractor for the Chicago, Milwaukee & St. Paul branch line, has established his first grading camp on the line of the Milwaukee on the Woodman ranch, three miles from Lewistown, to grade towards Great Falls. Other camps are being established in extending the line from the Musselshell country to near Great Falls.

The Chicago, Burlington & Quincy R. R. is reported to be about to let contracts involving the expenditure of approximately $1,000,000 for building a new line from Scribner to Fromberg and tearing up the present line between Scribner and Toluca.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The New York Central & Hudson River R. R. is reported to be about to award a contract for the double-tracking of all that portion of the Falls road between Lockport and Albion which is not double-tracked. It is planned if possible to have all this work completed by fall. There is about 21 miles of the road not double-tracked in the stretch mentioned.

The Rochester & Southern Construction Co., which proposes the construction of an electric railway between Rochester, Corning and Elmira, is reported to have secured the necessary capital for carrying out the project. George E. Engert, Rochester, is interested.

John F. Turk, promoter of the proposed electric railroad from Hornell to Bath, passing through Howard, has announced at the latter place that if $75,000 can be raised locally by the sale of stock, the success of the road will be assured, as New York parties will undertake the financing of the road from that point.

The city of Dunkirk has voted to issue $100,000 of bonds for the erection of a public dock.

The Hudson Valley Ry. Co. of Glens Falls has petitioned the village of Saratoga Springs for a franchise to lay a trolley track through East Ave. in the village. The petition is made for the purpose of uniting the Glens Falls line with the Troy-Saratoga road, and thus to form a direct trolley route from Troy to Warrensburg without change of cars.

Surveys have been completed and most of the preliminaries adjusted for the construction of the steam railroad which the New York, Westchester & Northern R. R. Co., backed by the New York, New Haven & Hartford R. R. Co., is to build, connecting New York and Danbury. Contractors have been over the route and according to a statement of President Leverett S. Miller of New York City, construction operations will begin in a few weeks, after the New York Public Service Commission has given its formal approval of the plans for the part of the road lying within the state of New York.

The New York Dock Co. Ry. has been incorporated with a capital stock of $500,000, and proposes the construction of the road in three sections, as follows: First from Fulton St., along the East River to Wall St. Ferry; the second, from Columbia St., down to Buttermilk Channel; the third, from Summit to Walcott St., around the Atlantic Basin. The directors are as follows: G. E. Spencer, Charles E. Hotchkiss, Henry M. Haviland, Walter Haviland, Arthur N. Taylor, Charles A. Lewis and Charles Jackson of Brooklyn, N. Y., and M. W. Lord and J. B. Summerfield of New York city.

Bids were opened May 24 at Albany by the State Superintendent of Public Works for two barge canal contracts. H. S. Kerbaugh, Inc., of Philadelphia, was lowest, at $1,990,043, for contract No. 63, for work between the Wayne-Monroe county line and Kings bend, west of Pittsfield, and E. M. Graves of Cleveland, O., was the lowest, at $767,467, for contract No. 73, for dredging the Hudson River from Stillwater to Northumberland. The engineer's estimate for this latter work was $778,960.

The New York Central & Hudson River R. R. has filed plans with the Bureau of Buildings of Buffalo for an addition to the car shops of the company at East Buffalo. The new building will increase the capacity of the plant 150 per cent. The new structure will be located on William St. near the Erie tracks and will cost about $90,000. Other equipment will cost about $50,000 more.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

City council of Fremont has granted a 25-year franchise to the Fremont Street Ry. Co., which will turn over its franchise and local property to the new Fremont-Fostoria line, which is to be built this summer. R. W. Lysle of Chicago, former city engineer of Fostoria, has the contract to furnish the material and construct the road and has his material orders placed with assurances of prompt delivery.

The A. & A. Short Line Ry. Co. of Alliance has been incorporated with a capital stock of $10,000. W. P. Keith is an incorporator.

The Fath Construction Co. of Cleveland has been incorporated with a capital stock of $30,-

000, the incorporators being Charles Fath, Commodore P. Ruple, E. C. Cooke, H. A. Hauxthurs and A. B. McGraw.

The Lake Shore & Michigan Southern R. R. has purchased the property now occupied by the Wilson hotel at the Himrod Ave. Youngstown crossing, with a view to moving the buildings so that the curve in its tracks at this point may be eliminated.

It is stated that the report of the various railroads interested in the proposed elimination of grade crossings in Youngstown and the erection of a union station will be ready about July 1. The plans outlined include the formation of a terminal company to secure right of way and make improvements which will be necessary before the dangerous grade crossings will be abandoned. It is said the improvements, as outlined, call for an expenditure of over $5,000,000 for new tracks and the union passenger station.

According to reports the Marietta, Columbus & Cleveland R. R. Co. has had surveys made for the construction of an extension of the line from Palos Junction, the present terminus of the road, to Athens, where connections will be made with the Hocking Valley. It is said that all financial arrangements have been completed for the work and that actual construction will be started shortly. The headquarters of the company are at Marietta, Ohio.

The Cincinnati, Hamilton & Dayton R. R. is to shortly award a contract for the construction of new shops and a roundhouse in Toledo to cost $100,000.

Plans are reported under consideration for extending the Cincinnati, Georgetown & Portsmouth R. R., E. W. White, general manager, Cincinnati, O., from Portsmouth to West Union.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Osage Western Ry. Co. has submitted a proposition to the citizens of Ponca for the construction of the road into and through Ponca city to Tonkawa. It was the original intention of the company to build the road on the most direct line from Pawhuska to Enid, going 12 miles south of Ponca city.

Advices from Erick, Okla., state that promoters of the proposed Erick-Englewood R. R. are about to let contracts for the construction of the line. Commercial Club of Erick is interested.

At the last annual meeting of the Choctaw, Newcastle & Western Ry. Co., held at McAlester, Okla., the following directors elected: G. W. Stone, Oklahoma City, president; W. L. H. Clayton, Jr., McAlester, vice-president; Henry Leboquest, secretary-treasurer; A. H. Price and W. E. Wilson, Oklahoma City, Okla. It was also announced that 11 miles of line will be built at once to connect between Alderson and the Rock Island & Savanna, on the Missouri, Kansas & Texas.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Preliminary steps have been taken to organize an irrigation district in the vicinity of Grants Pass. It is proposed to build a storage reservoir at the head of the Applegate River to irrigate the valley in the vicinity of Grants Pass by a gravity system. F. J. Blakeley, Roseburg, Ore., is interested.

The Puget Sound Bridge & Dredging Co., Seattle, Wash., has been awarded the contract for construction of a masonry dam across the Clackamas River, 30 miles south of Portland to cost $325,000. The work will require a year and the power to be developed will be used by the Portland Railway, Light & Power Co. The dam, which will be of Ambursen type, will be 885 ft. long, 100 ft. high, 140 ft. thick at the base and 12 ft. wide at the top. Hydro-electric power to the extent of 25,000 hp. will be developed.

The Carlton & Coast R. R. Co. which is controlled by the Carlton Consolidated Lumber Co., W. B. Dennis, general manager, Carlton, Ore., is stated to have asked bids for building the first section of its line. This road will be a connection between Carlton on the Southern Pacific & Fairdale, in the heart of a thickly-timbered county. The line is to be completed within 90 days after the award of the contracts. Rails have already been received.

George Alexander, consulting engineer, Boston, Mass., has completed preliminary surveys for the construction of the proposed line of the Central Railway of Oregon, from Union, Ore., over Blue Mountains to Walla Walla, Wash. The matter of proceeding with the work will now be taken up by the stockholders.

Advices from Fairview, Ore., state that a considerable force has been put to work on the construction of the right of way for the Troutdale cutoff of the Oregon Railroad & Navigation Co. All right of way has been secured to the junction and work will progress steadily.

It is understood that construction work will be started shortly on the proposed line from Salem, Ore., to Silverton. According to the present plans of the company the line will extend through Silverton up into Clackamas county, and by way of Oregon City to Portland, Ore. A. Welch, Portland, Ore., is president of the company.

It is believed that Stephen Carver, Corvallis, Ore., is backing a project to construct a railroad from Eugene, Ore., 20 miles, to connect with an extension of his Corvallis & Alsea River R. R. City council of Eugene is now considering the granting of a franchise over certain streets for the new railroad. The ultimate object of the project is believed to be a line to tidewater on the Siuslaw River.

The section of the Woodburn-Springfield Branch of the Southern Pacific between Crabtree and Lebanon, Ore., put out of commission some time ago by a change in the course of the Santiam River, is nearly rebuilt, and it is expected that operation of it will be started about the middle of June.

Committee recently appointed by the Jacksonville, Ore., Commercial Club has succeeded in obtaining all right of way for a proposed railroad to Blue Ledge Mining district and will tender deeds for same to John R. Allen, president of the Pacific & Eastern, trusting to interest him in the project.

The Oregon Trunk Ry. Co., John F. Stevens, president, Portland, Ore., has filed supplemental articles of incorporation declaring its intention to build up the valley of the Deschutes River and its tributaries, and in a general southerly direction to a point at or near Klamath Falls, in the state of Oregon, and also from a point on the main line of the railway of the said corporation in township 35 south, range 7 east, of the Willamette meridian, in Klamath County, Oregon, to a point in the city of Medford, Jackson County, Oregon, a distance of about 70 miles, with such branches and extensions as the corporation may hereafter decide upon.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Philadelphia & Suburban R. R., a new company, which proposes the construction of a line at Philadelphia and vicinity, will shortly have an ordinance before the city council to permit it to construct a subway on Broad St.

The city council of Doylestown has passed an ordinance giving a right of way on Union St. to the Philadelphia & Easton and Rapid Transit Railway Co. to lay tracks on that street and build a union depot.

John H. Dobbing, York, Pa., has been awarded the contract to grade for the extension of the Hanover & McSherrystown Street Ry. Co.'s line from McSherrystown to Conewago chapel. The work has been started. From Conewago chapel the proposed new road will branch, one line going to Gettysburg the other to New Oxford.

The Carter Construction Co. of Chicago, Ill., which has the general contract for constructing the Western Maryland R. R. extension from Cumberland, Md., to Connellsville, Pa., has awarded the sub-contracts for concrete work in the vicinity of Meyersdale and Confluence. The Somerset Construction Co. of Somerset got the contract for work about Meyersdale, where there will be 6,000 cu. yds. of concrete work on the big viaduct that is to cross the Baltimore & Ohio tracks. In the vicinity of Confluence H. E. Nay of Roanoke, Va., was the successful bidder for about 5,000 cu. yds. of concrete work.

The Pittsburg & Shawmut R. R. Co., organized to construct the Pittsburg extension of the Pittsburg, Shawmut & Northern Ry. into the Pittsburg district, has elected the following directors: Harry Bronner, H. E. Huntington, Edwin Hawley, Frank Trumbull, Theodore P. Shonts and W. H. Taylor.

It is rumored that the Wabash R. R. is planning the construction of its lines through Butler county, Pa., to the extensive coal fields in Armstrong and Jefferson counties. Right of way men, it is said, are already closing contracts. As reported the Wabash will use the Baltimore & Ohio from Butler to Pittsburg, under a trackage agreement.

The Chambersburg, Greencastle & Waynesboro Street Ry. Co., Chambersburg, Pa., according to reports, is shortly to extend its line from Pen Mar Park to Blue Ridge Summit.

The Montgomery & Chester Electric Ry. Co. and the Phœnixville, Valley Forge & Stafford Ry. Co. are both trying to obtain a franchise for a right of way through the streets of Phœnixville. The latter company is to be the connecting link between the Philadelphia & Western and the Lehigh Valley Transit Co.

The West Shore Ry. Co. has been organized at Wilkesbarre and proposes the construction of a third rail railroad from that city to Pittston. Surveys have been made and a charter has been secured. The road will be about 8 miles long and will extend through Forty Fort, Wyoming, Exeter and West Pittston. The terminal of the road in West Pittston will be near the Valley station.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Houston Electric Co., David Daly, general manager, Houston, is considering making certain street car line extensions in the east Third ward at Houston.

The East Texas Traction Co. is to decide on June 2 on the selection of the route of its proposed interurban line from Dallas to Terrell. Surveys for two routes have been made. Schuyler Marshall, Dallas, is interested.

Good progress has been made with the grading work for the Brownwood North & South R. R. from Brownwood. Practically half of the grading will be done by June 1, and by Aug. 1 the entire distance will be covered. The Texas Construction Co. has the general contract for the work.

The Houston Belt & Terminal Ry., F. T. La Pierre, resident engineer, Houston, is contemplating a number of improvements at Houston. There is contemplated a nine-mile belt railroad, to afford trackage for all roads desiring to enter Houston over the tracks; a $200,000 steel draw bridge over the ship channel about a mile above the turning basin, as well as many improvements in wharfage facilities.

Thompson & Scott, St. Louis, Mo., who have the general contract for the grading work for the extensions of the Stephensville North & South Ry. (Cotton Belt), from Hamilton to Gatesville, 32 miles, have sublet the first 18 miles of work out of Hamilton to W. P. McCoy, J. H. Kilbeck and G. J. Gammett.

The Bowers Southern Dredging Co. has its dredge No. 6 at work at Texas City, dredging a new channel and slip for the Texas City Transportation Co. The contract calls for the removal of about 400,000 cu. yds. of earth. The work will be completed July 1.

The Ball Construction Co., Dallas, at $107,000, and J. G. White Co., New York, at $85,000, were the only bidders for the completion of Lock and Dam No. 6 on the Trinity River for the U. S. government. The original bid, upon which the contract was let to the Hub-

bard Building & Realty Co. of Dallas on July 28, 1906, to begin work Oct. 10, 1906, and to finish Sept. 1, 1908, was for $144,113. The work was sublet to the Ball-Carden Co. of Dallas, and it is estimated by the engineer that about half of the work was done. All of the piling for the lock was driven, the land and the river walls of the lock were finished and the cofferdams constructed. It remains to have the floor of the lock laid and the dam built.

Topographic survey work along Little River in the vicinity of Cameron has been completed and the land owners are ready to begin the construction of levees as soon as decision is made as to the best type of levee. Arthur A. Stiles, Austin, is state levee and drainage commissioner.

The commissioners' court, at Angleton, has ordered an election for June 21 to vote on issuing $124,740 in bonds to complete the Pearland Drainage Project.

O. E. Gammill, who has just completed the Bryan college trolley line, has taken a subcontract for part of the work on the big levee being built along the Brazos River near Bryan and has moved his grading outfit to the bottom. His contract calls for the removal of 50,000 yds. of dirt.

The city council of Brownsville has granted a street railway franchise to B. G. Stegman and others for a railroad to be operated by electricity or gasoline motor power, construction to be commenced within four months, and three miles to be finished within one year. The whole line must be completed within two years.

Committees representing the Commercial Clubs of Palestine and Dallas have been appointed to arrange preliminaries for the construction of an air line railway between the two places. The proposed line will be about 100 miles long and will traverse a populous agricultural region. It will run several miles from any existing line. The two terminal cities and the towns along the route will raise bonuses in aid of the project, it is stated, and it is thought no difficulty will be experienced in bringing about the early construction of the line.

The Eastern Texas Traction Co. has completed preliminary surveys for four routes for the projected interurban line from Greenville to Wolfe City. These routes are as follows: Route A—Via Tidwell, Tyler's Gin, to Wolfe City. Route B—From Wolfe City via Tyler's Gin, White Rock and Tidwell to Greenville. Route C—From Greenville via Robert Gardner's; Green's Crossing and Aberfoyle to Wolfe City. Route D— From Greenville via Haney's Ridge, McWhirter residence, Spurlock Crossing, South Sulphur neighborhood and Aberfoyle to Wolfe City. A permanent line will be selected at once from the four routes surveyed.

The new river route survey for the Kansas City, Mexico & Orient Ry. has been completed. This survey was made following the initial selection of the divide route between El Dorado and Del Rio, missing Sonora, and over the protest of the latter town. After it was shown that the river route was shorter by more than 10 miles that the originally selected course, the survey was ordered and the estimate was found to be correct.

Grading work is under way for the new railroad between Anson and Hamlin. The two towns recently closed a contract with Col. Morgan Jones of Abilene for the construction of a new line of road from Abilene to Hamlin via Anson, and the work will be concentrated on the Anson-Hamlin end until same shall have been completed.

R. H. Baker, former president of the Trinity & Brazos R. R., has purchased the Texas Central R. R. He will organize a syndicate of Texas men to take over and operate the property as an independent enterprise. It will be extended from Waco to a connection with the Beaumont & Great Northern, which is to become a part of the Texas Central. The plans call for the building of the line to Beaumont on the southeast and to Rosewell, N. M., on the northwest.

Work is to be started at once by the Missouri Kansas & Texas R. R. on the laying of 15 miles of 85-lb. steel on the Fort Worth Division from Fort Worth to Eagan, Tex. After the completion of this stretch the remainder of the line from Eagan to Hillsboro will be laid with the heavy steel.

The construction work on the Gulf, Texas & Western has been completed into Seymour, Texas, and operation of that section will begin at once.

According to reports from the Southwest the Chicago, Rock Island & Pacific R. R. has under consideration the construction of a line west either from El Paso, Texas, or Albuquerque, N. Mex., to an outlet on the Pacific Coast.

Engineers of the American Central R. R. are now at work on the proposed line, and it is expected that construction work on the first block of the line between Miami, Texas and Vernon will be started soon. As projected this portion of the line will pass through Mobeetie and Wheeler, Texas, and Texola, Mangum and Olustee in Oklahoma. The company was originally incorporated to build from Canada to the Gulf through Western Dakotas, Nebraska, Kansas, Oklahoma and the Panhandle of Texas a direct feeder for the middle west to the Panama Canal.

Good progress is being made with the construction of the San Antonio, Rio Grande & Tampico Ry., and it is expected that 40 miles of the line extending from San Antonio to Jourdantown in Atascora county will be ready for operation by September.

I. H. Kempner and associates from Galveston have purchased the water works and irrigation rights at Alamogordo, N. Mex., for $180,000. It is claimed that with a further development of the water power that section of New Mexico can be made a very rich country.

Citizens of Goliad held a mass meeting May 24 to discuss further plans toward raising the railroad bonus required to get the Aransas Harbor railroad through the country.

The Nueces Valley R. R. Co. filed its charter at Austin on May 25. The company proposes construction of a railroad from Beeville, Tex., to Eagle Pass, 175 miles. Lee Frisby of Austin, R. M. Buck of Fort Worth, Ark.; W. A. Frisby of Beeville, and others, are the incorporators. It is stated that the road has been financed in Philadelphia, and that the construction contract will soon be let.

Promotors of the Dallas-Terrill interurban line are to meet on June 2 to definitely determine on the proposed route for the road.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Beaver Land, Power & Irrigation Co. is to have work started shortly on an irrigation project near Milford. The project will include the building of two dams and the construction of about 100 miles of ditches, of which 30 miles will be main canals. Water enough will be impounded to irrigate 70,600 acres. The water to be used for irrigating purposes will be taken from the Beaver River. The work will be done under the direction of George L. Swendsen, Salt Lake City, engineer for Slick Bros. Co.

A progress of about 14 ft. per day is being made in the tunnel of the Strawberry Irrigation project of the U. S. Reclamation Service. The tunnel is now in over 1½ miles, about half way through the mountain. John Peters and Thomas J. Farrer, Provo, have been awarded the contract for hauling 2,000 tons of material from the railroad at Diamond switch, Spanish Fork canyon, to the mouth of the Strawberry Irrigation project tunnel, situated about 25 miles to the northeast and up toward the top of the mountains. L. J. Lytel, Provo, Utah, is Project Engineer.

The A. B. Corey Construction Co., Ogden, Utah, have a contract for the construction of sidings and double track extensions which is said to portend the ultimate double tracking of the Southern Pacific from Ogden to the Pacific Coast.

The Ogden Rapid Transit Co. is making good progress with the extension of its line from Utah Hot Springs to Brigham City. From Brigham City it is believed to be the intention of the company to carry its line up through Cache valley some time next year, using the old narrow gage line of the Utah & Northern Railroad Co. to reach the valley.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A license to engage in a constructing and engineering busines in Virginia has been issued to the John Ferguson Co., a corporation organized and existing under the laws of the state of New Jersey. Preston Cooke of Richmond, is statutory agent. Maximum capital authorized by charter is $100,000.

Construction work is under way on a further extension of the Indian Creek & Pound River R. R., of which W. M. Currier, Glamorgan, Wise County, Va., is president, from a point near Pound Gap, on the Kentucky-Virginia border, running up the left fork of Pound River, contiguous to the Kentucky line, penetrating a rich timber field, yet almost untouched.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A project is under consideration for the construction of a new street car line for the north end of Seattle. The route for the proposed line has been chosen as far as Woodland Park. The line will go north on Fourth Ave. to Queen Anne Hill and through a tunnel to Evanston Ave., crossing the canal at Etruria St., and thence to the park. At the park two branches, one on each side of Green Lake, are planned. C. H. Shields of the Spokane Grain & Fuel Co., Spokane, is interested.

The main construction camp of the Grays Harbor Construction Co., which has the contract for the construction of the Milwaukee road in the neighborhood of Cosmopolis, has been established about five miles from the city.

The Bellingham Bay & British Columbia R. R., Mott Sawyer superintendent, Bellingham, is to expend $50,000 or more during the coming summer in reballasting its road-bed and in doing other repair work to put its line in better shape and cut down running time.

Advices from Sumas, Wash., state that the Great Northern Ry. Co., is rushing work on the main line east of Abbottsford with all possible speed.

Attorney of the Northern Pacific and City Council of Steilacoom, Wash., have come to an agreement providing for the franchise through the city. The company, according to the contract must construct a depot and all viaducts over street crossings.

The U. S. House of Representatives has passed a bill granting an extension of one year to the Alaska Short Line R. R. to begin building its 300 miles of road across southwest Alaska from Cook's Inlet to Anvik by this bill the company has until June 1, 1911, to begin work.

The Tacoma Railway & Power Co., L. H. Bean, manager, Tacoma, will shortly start work on the extension of its 6th Ave. line at Tacoma.

Preliminary surveys for the projected interurban line of the Bellingham-Skagit Ry. Co. have been about completed, and actual construction work will probably be started soon. The line is to extend from Bellingham to the Skagit County towns and is to be built by the Stone & Webster Engineering Corporation, of which R. T. Laffin, White Bldg., Seattle, Wash., is district engineer.

The city council of Olympia has directed the city engineer to prepare estimates of the cost of filling in the tideland area between Percival's dock and Springer's mill and extending in places from Third St. out to C St, the latter being three blocks beyond First St. Eventually the Olympia Factory Site Co., of which Dr. P. H. Carlyon is the head, and which controls the tidelands out to deep water, proposes to fill the lands out to deep water, a distance of almost a mile.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chippewa Valley Ry., Light & Power Co., Eau Claire, is to extend its street car line at Menominee, a distance of 1⅓ miles,

to the John Henes Park. The work is to be completed by July 15.

The Council Railroad Committee of Milwaukee has been considering an ordinance granting franchises to the Milwaukee Electric Railway & Light Co., so it can operate three north and south lines, using the 6th, 16th and 27th St. viaducts.

Final surveys have been made for determining the route for an extension of the Fairchild & North Eastern Ry. N. C. Foster, Fairchild, Wis., is president and general manager.

Grading has been started on the proposed Badger Short Line Ry., and camp has been established at Emerald, Wis. The heaviest piece of work to be encountered will be between Emerald and Camp 9, a distance of 4 miles. John Rassbach and G. E. Scott, Prairie Farm, are directors of the company.

Advices from Manitowoc, Wis., are to the effect that the Chicago & Northwestern Ry., has made surveys for an extension of a branch from New Denmark on the Manitowoc Green Bay extension to Kewaunee and Algoma. Construction work, it is said, will be started this year.

The Commercial Club of Madison, Wis., has appointed a committee to investigate the proposition of an electric, gasoline and steam railway extending westward from that city. C. S. Smith is one of the Committee.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city of Regina, Sask., has voted to construct a municipally owned street railway.

A company is said to be about to ask the municipal authorities of Toronto, Ont., for a franchise to operate railways beneath the city streets and to provide terminal facilities for steam and electric railways. If the company obtains the privileges it desires, it will apply for a Federal charter and will erect a large office building and terminal station at a point yet to be selected, probably in the southern business section of the city. Into this it purposes to run double-deck tunnels, the floors of which will be about 40 ft. below the surface of the ground. Upon the bottom of the tunnels the trains of railway cars will be hauled upon four tracks, two local and two express, by electric locomotives, to passenger and freight stations. Above that upon a steel structure, similar to that employed for elevated railways, electric cars will run. The third-rail system will be used in the tunnels. The promoters of the enterprise are R. L. Cowan and L. C. Reynolds of Toronto; M. J. Stewart and R. W. Foster of Stewart, B. C., and A. P. Gillies of Tacoma, Wash., and New York city.

The Canadian Pacific R. R. is reported to have received bids for grading work for a portion of the Kootenay Central Ry. It is planned to let contracts for about 30 miles of work starting from the south end of the line. The Kootenay Central, following the valleys of the upper Columbia and Kootenay Rivers, will link the main line of the C. P. Ry. with the Crow's Nest branch, traversing valleys reputed to be rich in mineral and agricultural resources. At its southern end the railway will join the Crow's Nest Pass branch at a point some miles to the east of Cranbrook, near Galloway. From Galloway the road will run to Fort Steele, thence along the valley of the Kootenay to Canal flat, past Upper Columbia Lake and the Upper Columbia River to Golden.

The Canadian Pacific R. R., C. E. Cartwright, division engineer, Vancouver, B. C., is to extend its docking facilities at Victoria, B. C. It is proposed to widen the Belleville St. wharf, adding an additional 30 ft. to the entire length, and extending it westerly as far as the property extends.

The Hyland Navigation & Trading Co., operating a fleet of river steamers, has bought five acres on the Red River at the foot of Lusted St., in the north end of Winnipeg, as a site for extensive docks. It is preparing to build a big equipment of scows and tugs for the freight business from Lake Winnipeg, made possible by the opening of St. Andrew's locks. The company paid $120,000 for the dock site and expects to invest as much more in equipment for this year's business.

Work is to be started at once on the Portland Canal Short Line Ry., according to a statement of W. H Grant, Victoria, B. C., superintendent of construction for the Mackenzie & Mann interests. The contract for a 60-ft. wide, 160-ft. long dock at Stewart, B. C., for the railroad, has been let to James McDonald, Victoria.

The Minister of Public Works has notified the city council of Quebec, Que., that the government will at an early date consider the question of dredging the river St. Charles.

Morrison & Clark, Summerside, P. E. I., have been awarded the contract for the diversion of the Intercolonial Railway, near Chatham, N. B., with a view to eliminating the present heavy grade between Loggieville and Nelson, and giving better railway facilities at Chatham. The whole work involves an expenditure of about $500,000, and the construction of about 8½ miles of railway. It is understood that the contract awarded to Morrison & Clark amounts to about $200,000.

It is reported here in Montreal that Sir Wm. C. Van Horne, of the Canadian Pacific Ry., will shortly leave on a trip to Australia to advise the Commonwealth with regard to the construction of a railway across the continent with the object of settling the interior, which is practically without inhabitants.

An agreement has been reached whereby the Grand Trunk Pacific Ry. will build a line from Weyburn, Sask., to connect with the Hill system at a point near Scobel, southwest of Weyburn.

The promoters of the Hudson Bay & Pacific Ry. will probably hold a meeting for organization purposes some time this month. The company proposes to construct a line of railway from Prince Albert to Fort Churchill on Hudson Bay, and the promoters are said to be ready to at once subscribe for $2,000,000 of stock.

Efforts are being made by the residents in the vicinity of Beulah, Man., to induce the Canadian Northern R. R., to lay track on the embankment constructed some time ago between that city and Isabell.

The Lachine, Jacques Cartier & Maisonneuve Ry Co., a subsidiary company of the Grand Trunk, is planning the construction of a line from the harbor front at Maisonneuve, Que., round the mountain to Lachine. The line will be completed to St. Laurent during the coming summer, it is expected. C. M. Hays, Montreal, Que., is president of the new company. Terminals and station will be established on St. Catherine St., between Frontenac and Harbor Sts.

The Long Sault & Abitibi Ry. Co. has filed articles of incorporation with a capital stock of $2,000,000 and principal offices at Hull, Que. The company asks wide powers, including the operation of railway and steamship, telephone and telegraph lines, operation of mineral and timber industries, mills and factories, and the running of hotels and boarding houses. The company proposes to build a line from a point on James Bay, between the interprovincial boundaries and the East Maine River in Quebec, and connect with the C. P. R. at a point between the Long Sault at the foot of Lake Temiskaming, and the Des Moines River. The promoters of the railway are Messrs. Thos. G. O'Brigham, Edward Mulligan and David Mulligan, all of Ottawa.

Sabin & Stevens, according to advices from Victoria, B. C., have been awarded the contract for clearing the right of way for the construction of the Comox Extension & Northern Ry. The contract calls for the completion of the work within five months after it is started, and covers the line from Union Bay north to Black Creek.

Edward Box, representing a syndicate of English capitalists, has signed an agreement with the town of Owen Sound, whereby the syndicate will construct a million dollar ship building and repair plant and two dry docks at Owen Sound. The plant will be built on the C. P. R. water front and that company is taking a block of stock in the concern. The company proposes to build in Owen Sound two dry docks, a graving dock 650 ft. long and a floating dry dock capable of handling steamers up to 300 ft. in length, and in addition to put in a ship building and repairing plant. The yard plans will include building berths for three vessels, so that three boats may be under construction at the same time. Complete machine shops, boiler shops, etc., will be built, and a large modern plant for the handling of large ship building contracts erected.

The Canadian Northern Railway Co. has filed with the railway commissioners for approval detailed plans for the entrance into Ottawa of the company's new line from Toronto to Montreal. The plans provide for an approach to the city from the junction with the company's present line from Quebec, east of the Rideau River. This action of the company seems to indicate that the road will pass through Ottawa instead of following the St. Lawrence frontier, as has been suggested.

Mackenzie, Mann & Co., Toronto, Ont., owners of the Canadian Northern Ry., are calling for tenders for the building of the first 60 miles of their road in British Columbia. This construction will be from the coast eastward.

The Canadian government is to have surveys started immediately under the direction of L. R. Boligny, to ascertain the possibility of making a navigable route between Edmonton and Winnipeg by way of the North Saskatchewan River and Lake Winnipeg. Explorers have reported that a 6 or 8 ft. waterway can be established on this route at a comparatively low cost, with few lockages, as the river has a deep and broad channel for nearly the whole distance. A vote of $10,000 was made in parliament last session to defray the cost of the survey.

Mexican Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Southern Pacific engineers have completed the surveys for the Southern Pacific extensions in the barrancas of the Sierra Madre, near the Jalisco-Tepic boundary, and during the next few months will be engaged in the location of the extensions between the barrancas and the Tepic capital. Two lines have been located through the barrancas, one with a maximum grade of five-tenths of 1 per cent and the other with a maximum of 1 per cent. The cost of the 20 miles of mountain road is estimated at from $8,000,000 to $10,000,000. The line will be a succession of tunnels and viaducts. C. R. Breck, Jr., San Francisco, Cal., is the locating engineer.

Engineer Azam, of Pachuca, has gone to Ixmiquilpan to make a complete survey for the installation of the 5,000 H. P. hydroelectric plant for which his firm holds the concession. The plant will be situated some twenty kilometers east of the town of Ixmiquilpan on the Tonantongo River and is intended to supply power and light to the district of Zimapan Ixmiquilpan and Actopan.

Residents of the Mill and Dickinson streets sections of Springfield, Mass., have petitioned the city for the granting of a franchise to the Springfield Street Railway Co. to build a car line through Mill and Dickinson Sts. to the east entrance of Forest park.

The committee on railroads of the State Legislature of Massachusetts has recommended that the legislature pass the Berkshire trolley act, which provides that the New York, New Haven & Hartford R. R. Co. may purchase the capital stock of the Berkshire Street Railway Co. of Pittsfield, Mass. It is said that the New Haven company is to spend $2,000,000 in improving the street railway systems in the western part of the state.

The Maryland Dredging Co. of Baltimore, Md., is making good progress with its contract for excavating the Cape Cod ship canal in Massachusetts, the monthly excavation amounting to 750,000 cu. yds. New machinery has just been put on the work, and now on the 8 miles of construction there are eight dredging machines at work. These are in three groups, one at each end and the others in the middle. The middle section is being

excavated by land dredges of the type which were first used on the Chicago drainage canal. The Cape Cod canal will connect Cape Cod and Buzzard's Bay, and will be 25 ft. deep at mean low water and 100 ft. wide at the bottom. It will be without locks, as the land in that section is low and level and engineers believe that the tidal flow of the water will not prove troublesome. On the Cape Cod bay end a breakwater 5,000 ft. long is to be constructed, and work on this is progressing satisfactory. The southern end of the canal comes out in Buzzard's Bay. Under the terms of the contract the canal is to be completed by the fall of 1912.

The Carolina, Chinchfield & Ohio R. R., M. J. Caples, chief engineer, Johnson City, Tenn., is preparing to erect coal chutes and terminals on the upper water front at Charleston, S. C.

The Northern Pacific R. R. is securing right of way in the vicinity of Ryder, N. Dak., for the purpose, it is said, of extending the Turtle Lake line to a point south of Ryder, across the Missouri and into McKenzie county.

Preliminary work has been started near Oscuro, N. Mex., by Capt. D. W. Roberts, for a large irrigation project, which is being promoted by Patten Bros., Denver, Colo. The project proposes the construction of a large concrete dam.

R. H. Phillips, manager of the Washington, Spa Springs & Gretta Railway Co., which is preparing to build an electric line from the District of Columbia line to Bladensburg, has submitted the plans of the company to the Maryland State Roads Commission and asked for its approval. The line is being built toward Kensington, Md., and Sandy Springs and will eventually be extended to Ellicott City. Among those who are interested in the new road are Allan Farquahar, Charles Brooke, Gist Blair, Harold Harding and Bernard M. Carter of Baltimore, Md.

W. W. Finley, president of the Southern Ry., has announced that the Southern Ry. will shortly take up the matter of constructing extensive freight terminals at Atlanta, Ga.

The Pennsylvania R. R. has applied to the city authorities of Newark, N. J., for an ordinance to enable the railroad "to improve its passenger service between Newark and New York." The plans provide for the changing of the elevated structure at the Market St. station, Newark, so that four tracks can be operated instead of two, as at present. They also call for the replacing of the present station with a new one, to cost about $500,000.

The Nebraska Transportation Co., Omaha, Neb., is stated to have secured all right of way for the projected interurban line from Omaha to Fremont, Neb., and is said to be only waiting for satisfactory franchise in the latter place before beginning work. The line will be 30 miles long and will pass through Elmwood Park, Bennington, and Elk City.

The U. S. House of Representatives has passed a bill ratifying an act of the Hawaiian Legislature authorizing W. A. Hall, of Honolulu, and his associates to construct and operate a railroad on the island of Hawaii.

The Elizabeth & Trenton Street R. R. Co. has been incorporated with an authorized capital stock of $1,200,000. The company is to take over and operate the trolley road of the Trenton & New Brunswick Co., which was sold on May 1 under mortgage foreclosure proceedings. The new company will also take over the road and franchise of the New Jersey Short Line R. R. Co., which is an extension of the main line. The incorporators are Claude L. Rihl and Irvin Shupp, Jr., of Philadelphia; Charles Sinnickson, Rosemont, Pa.; Chester A. Entrekin, Ardmore, Pa.; H. Hayes. Aitkens, John W. Kelly, W. A. Garwood, Llanerch, Pa.; John R. Turner, Basking Ridge, N. J., and H. O. Coughlan, Brooklyn. The first directors chosen were Messrs. Shupp, Rihl, Aitkens, Entrekin, Kelly, Turner and Garwood.

It is reported that bids will be asked soon for the construction of the proposed car shop and mill plant at Omaha by the Union Pacific Ry. The work is estimated to cost about $400,000.

As a result of an inspection of the Salt Lake Division of the Southern Pacific Ry., by J. Davis and E. C. Manson, Superintendents, it has been announced that construction work on the new extension from Navajo, Ariz., to Owynio is progressing successfully and contractors expect to have the line completed for operation by August 1.

Construction work is progressing rapidly on the new classification yards of the Western Maryland R. R. near Cumberland, Md., on the West Virginia Division of the road. The improvements, it is estimated, will cost about $250,000.

The Southern New Hampshire Traction Co. has work well under on the reconstruction of the Merrimac Division. The work includes the cutting down of the Saunders Hill, between Haverhill and Merrimac, Mass.

According to reports the Great Northern Ry. Co., has a plan under consideration to construct a line from Towner, N. Dak., to Esmond crossing the new Avr-Surrey line. The present Towner-Maxbass line would then be extended to Regina, Sask., thus making a continuous line into that district.

It is reported that Thrasher & Gunter, Railroad Contractors, Chattanooga, Tenn., have been awarded the contract for the construction of 9 miles of track for the Nashville, Chattanooga & St. Louis Ry., between Wauhatchie and Whiteside, Tenn. Surveys for the work have already been made and the track will parallel the present main line of the Nashville road, however, at Etna the tunnel and heavy hill near that station will be eliminated.

The Cumberland & Pennsylvania R. R., H. W. Rittenhouse, engineer maintenance of way, Cumberland, Md., according to reports is to be extended from Mechanicsville, Md., its present terminus south toward Point Lookout.

The Franklin & Lewisburg R. R. Co. of Williamson County, Tenn., has been incorporated with a capital stock of $10,000. The incroporators are J. J. Covington, E. E. Green, S. D. Beel, R. A. Bailey, Jr.; B. H. Paschall, J. E. Short, Jolen H. Truett, O. E. Fox, J. A. Pierce.

The Creighton Electric Light & Power Co. of Creighton, Neb., is contemplating the rebuilding of its water dam at the Lower Mills, and furnishing Creighton with day and night service.

Russell Gaines, county surveyor, Louisville, Ky., is making a topographical survey and map of the overflowing districts in the third and fourth magisterial districts, south of the city of Louisville. The county already has $40,000 in the treasury for the purpose of constructing the canal. The ditch will be about ten miles long and will drain and reclaim some of the best lands in Jefferson county.

The W. O. Burton Co., Richmond, Va., is making good progress with its contract for constructing the Washington, Spa Spring & Gretta R. R. Co.'s line of street railway from 15th and H Sts. northeast, Washington, D. C., out the Bladensburg road to the line of the District of Columbia. It is expected that the line will be in operation by July 1.

The city council of Mobile, Ala., has adopted an ordinance authorizing the New Orleans, Mobile & Chicago R. R., W. F. Owen, general manager, Mobile, to build, maintain and operate railroad tracks in the city of Mobile in and near Choctow Point. The ordinance included right-of-way through Royal street to Augusta, where the company is to construct a passenger station and other improvements aggregating a cost of $250,000. The company is also granted the right to erect a spur track from the main line to the municipal water plant.

BIDS ASKED

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Fort Smith, Ark.—Until 2 p. m., June 13, by Roy M. Johnston, Secy., Fort Smith and Van Buren District, for the substructure; the substructure and erection of the superstructure and the superstructure delivered and erected of a bridge over the Arkansas River, between Fort Smith and Van Buren, Ark. The bridge consists of nine 196 ft. spans carrying double track electric railway and a single track railway on a paved roadway between trusses, two paved roadways, and two sidewalks on cantilevers outside trusses. Piers and abutments will be sunk by the pneumatic process. Steel, about 4,000 tons. Masonry, about 10,000 cu. yds.

Cedartown, Ga.—Until June 20, by Board of County Commissioners, for the construction of three concrete arch bridges. J. L. Moore is Chairman of the Board.

Springfield, Ill.—Until 3 p. m., June 8, by Board of Administration, for repairing and completing six pier footings at the Watertown State Hospital, Watertown, Ill. Official advertisement will be found elsewhere in this issue.

Brookville, Ind.—Until 1 p. m., June 6, by County Commissioners, for the construction of concrete arches and fills. Charles A. Miller is Auditor of Franklin County.

Greencastle, Ind.—Until 2 p. m., June 6, by County Commissioners, for the construction of four bridges and approaches. D. V. Moffett is Auditor of the county.

Hammond, Ind.—Until noon, June 7, by County Commissioners, for the construction of six iron bridges and one concrete arch. Charles A. Johnson is Auditor of Lake County.

New Castle, Ind.—Until 10 a. m., June 16, by County Commissioners, for the construction of arches, culverts and bridges. W. L. Risk is Auditor of Henry County.

Scottsburg, Ind.—Until 11 a. m., June 13, by County Commissioners, for the construction of a 50-ft. bridge over White Oak Creek. Frank Gardner is Auditor of Scott County.

St. Louis, Mo.—Until June 21 by Board of Public Improvements, Mazime Reber, President, for the removal of the old wooden bridge on Kingshighway and the construction of the foundations and concrete work of a concrete viaduct with all necessary approaches on Kingshighway from Manchester Ave. to McRee Ave.

Lincoln, Neb.—Until 2 p. m., June 2, by Board of County Commissioners, for furnishing labor and material for the construction and completion of all bridges ordered to be constructed during the year. It is estimated that about 40 wooden bridges will be constructed and 10 iron ones.

Albuquerque, N. Mex.—Until 10 a. m., June 6, by Board of County Commissioners, A. E. Walker, Clerk, for the construction of the approach to the new iron bridge across the Rio Grande near Alameda.

Cleveland, O.—Until 11 a. m., June 25, by Board of County Commissioners, for the construction of bridges as follows: Report No. 2638, concrete bridge, Harvard Rd., Warrensville Twp.; report No. 2639, concrete bridge, Lander Rd., Orange Twp.; report No. 2644, Concrete Culvert, Chagrin River Rd., Orange Twp.; report No. 2650, bridge extension, Harrington and Brook Park Rds., Rockport and Middleburg Twps. Frank R. Lander is County Surveyor.

Warren, O.—Until June 27 (readvertisement of bids asked May 23), by County Commissioners, for the construction of a bridge over Yankee Run on East Liberty St., in Hubbard. W. R. Carrington is Clerk of the Commissioners.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Fort Smith, Ark.—Until June 2, by County Commissioners of this district, for the erection of a jail building for the district. J. T. W. Jennings, Commissioner.

Bloomington, Ind.—Until 10 a. m., June 20, by Trustees of Penn Township, for the construction of a one-story brick addition to the school building. Isa Newlin is Trustee of the township.

Indianapolis, Ind.—Until 4 p. m., June 10, by Henry Dupont, Architect, 624 State Life Bldg., Indianapolis, Ind., for the erection of a new St. Paul Methodist Church which is estimated to cost $25,000.

Jeffersonville, Ind.—Until 3 p. m., July 1, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction complete, including plumbing, gas piping, heating apparatus, electric conduits

and wiring and lift of the United States Post Office at Jeffersonville, Ind.

Princeton, Ind.—Until June 20, by Elmer E. Reeves, Secy. Board of Education, for installing a heating and ventilating plant.

Rockville, Ind.—Until 2 p. m., June 16, by Adams Township Trustee for the construction of a one-story frame school house. L. B. Humphries is Township Trustee.

Somerville, Ind.—Until 2 p. m., June 7, by Advisory Board of Barton and Gibson County for the construction of a two-room addition to school house.

New Orleans, La.—Until 7:30 p. m., June 14, by Board of Commissioners of Port of New Orleans, for the entire erection and completion of a stable and toolhouse on the river front at the head of Poydras St.

Stanton, Mich. Until 1 p. m., June 22, by Board of Supervisors, for necessary labor and material for the construction and completion of county court house and jail, including sheriff's residence at Stanton.

St. Louis, Mo.—Until 3 p. m., June 7, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the installation of a conduit and electric wiring and gas piping system in the U. S. Post Office at St. Louis, Mo.

Columbus, Neb.—Until 3 p. m., July 11, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction complete, including plumbing, gas piping, heating apparatus, electric conduits and wiring of the United States Post Office at Columbus, Neb.

Omaha, Neb.—Until 11 a. m., June 13, by Capt. F. C. Bolles, Quartermaster, for the installation of a steam heating plant in Commissary Store House at Omaha Depot.

Madison Barracks, Sacket Harbor, N. Y.—Until 2 p. m., June 13, by Constructing Quartermaster, for the construction of heating, wiring and furnishing electric fixtures, making necessary water and sewer connections of a new bakery and construction of necessary roads and walks in connection therewith.

Madison Barracks, Sacket Harbor, N. Y.—Until 2 p. m., June 11, by Constructing Quartermaster, for the construction of plumbing, electric wiring and fixtures, for new station stables to replace the old ones.

Fort Constitution, N. H.—Until 2 p. m., June 7, by Constructing Quartermaster, for the construction of an ordinance shop at Fort Stark, N. H.

Howe, Okla.—Until June 6, by Howard Wellborn, Clerk of the School District No. 67, Leflore County, for the erection of two story brick school building.

Fort Moultrie, S. C.—Heating Plant.—Until 11 a. m., June 10, by Constructing Quartermaster, for the installation of hot water heating apparatus in the commanding officer's quarters.

Plankinton, S. Dak.—Until 8 p. m., June 1, by Plankinton Opera House Co., Plankinton, S. Dak., for the construction of a brick opera house building 50x120 ft.

Port Lavaca, Tex.—Until 5 p. m., June 15, by J. D. Crain, Secy. School Board, for the construction of a brick, stone trimmed, school building at Port Lavaca, Tex. A. O. Watson, First National Bank Bldg., is Architect.

Martinsville, Va.—Until noon, June 13, by J. H. Matthews, Clerk Board of County Supervisors, for the construction of a brick and reinforced concrete jail at Martinsville, Va.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Whipple Barracks, Ariz.—Until 3 p. m., June 4, by Lieut. G. G. Bartlett, Constructing Quartermaster, for furnishing necessary labor and material for the construction of roads, concrete curbing, gutters and walks at Whipple Barracks.

Washington, D. C.—Until 2 p. m., June 4, by District of Columbia Commissioners, for laying cement sidewalks in the District. John A. Johnston is one of the commissioners.

Albia, Ia.—Until 2 p. m., June 1, by City Clerk, for the construction of 4,060 yds. of brick pavement and 4,025 ft. of combined curb and gutter at this place. Hall & Adams, Centerville, Ia., are the Engineers.

Aurora, Ill.—Until 2 p. m., June 6, by Board of Local Improvements, for the construction of a roadway on North Avenue, between the Easterly line of Broadway and Jackson St.

Downers Grove, Ill.—Until 8 p. m., June 8, by Board of Local Improvements, for necessary labor and material for grading, draining, curbing and paving with brick, Grove St., from Main to Carpenter St. The work includes the following approximate quantities: 1,650 cu. yds. of earth excavation for roadways, curb and gutter; 150 cu. yds. of earth excavation for parkways; 2,075 lin. ft. of combined concrete curb and gutter; 2,950 sq. yds. of vitrified paving brick pavement; 6 sewer manhole covers adjusted to the grade of finished street; 4 stormwater inlets set to grade and line of curb.

Downers Grove, Ill.—Until 8 p. m., June 8, by Board of Local Improvements, for necessary labor and material for grading, draining, paving with brick, Gilbert Ave., from Forest Ave. to a point 1,225 ft. west. The work includes approximately: 2,400 cu. yds. of earth excavation for roadways and curb; 200 cu. yds. of earth excavation for parkways; 2,475 lin. ft. of combined concrete curb and gutter curb; 3,350 sq. yds. of vitrified paving brick pavement; 50 lin. ft. of 10-in. vitrified tile drain; 1 stormwater inlet set to grade and line of curb; 1 stormwater inlet adjusted to line and grade of curb; 5 sewer manhole covers adjusted to the grade of finished street.

Naperville, Ill.—Until 3 p. m., June 7, by Board of Local Improvements, for labor and material for cleaning and resurfacing with a bituminous cement binder 88,133 sq. yds. of roadbed.

Brazil, Ind.—Until 7:30 p. m., June 7, by City Clerk, for the construction of the cement sidewalks on National Ave. Jacob Prevett is City Clerk.

Decatur, Ind.—Until 10 a. m., June 6, by Board of County Commissioners, for the construction of four macadam roads in the county. H. S. Michand is Auditor of Adams County.

Greencastle, Ind.—Until 2 p. m., June 6, by Board of County Commissioners, for the construction of a macadam road in Millcreek Township. D. V. Moffett is Auditor of Putnam County.

Kentland, Ind.—Until 1 p. m., June 6, by Board of County Commissioners, for the construction of a macadam road in Jefferson Township. Elmer R. Bingham is Auditor of Newton County.

Logansport, Ind.—Until 1 p. m., June 9, by Commissioners of Cass and Carroll Counties, for the construction of a gravel road. George W. Cann and M. S. Haun are Auditors of the counties.

Shelbyville, Ind.—Until 7:30 p. m., June 7, by Common Council, for grading and graveling a number of streets and alleys and for the construction of cement sidewalks and curbs on several streets. L. E. Webb is City Clerk.

Washington, Ind.—Until 10 a. m., June 7, by County Commissioners, for the construction of a gravel road. Thomas Nugent is Auditor of Davies County.

Hutchinson, Kan.—Until June 3, by Board of County Commissioners, for the construction of 12 miles of road in Reno County.

Lawrence, Kan.—Until 5 p. m., June 6, by F. D. Brooks, City Clerk, for grading, paving and curbing Alabama St., from Henry to Pinckney Sts.

Augusta, Ky.—Until June 1, by J. T. McCracken, for the construction of 7,800 ft. of turnpike, known as the Ohio Valley Turnpike. The work includes grading and surfacing with metal.

Natchitoches, La.—Until 5 p. m., June 8, by A. L'Herisson, Mayor, for the laying of 34,953 lin. ft. of concrete sidewalk and curbing.

Baltimore, Md.—Until 11 a. m., June 1, by Board of Awards, for grading, guttering and paving with improved pavement, Bentalou St., from Baltimore St. to Fayette St.

Frostburg, Md.—Until June 4, by City Clerk, for grading and paving 1,325 ft. on Union St. William Harvey is City Engineer.

Freehold, N. J.—Until 11 a. m., June 15, by Board of Chosen Freeholders, for stoning roadbed and wings, paving gutters and curbing Main St. and South St. in Freehold. Each bid must be accompanied with a certified check for $1,000. George W. Patterson, Jr., is Clerk of the Board and G. K. Allen, Jr., is Engineer.

Brooklyn, N. Y.—Until 11 a. m., June 8, by Alfred E. Steers, Borough President, for the 13 street improvement contracts, the largest being as follows: For regulating, grading and curbing, and laying sidewalks on Hegeman Ave., from Hopkinson Ave. to New Jersey Ave., excluding the land occupied by and intervening between the tracks of railroad companies together with all work incidental thereto. The work includes: 9,780 lin. ft. of new curbstone set in concrete; 14,170 cu. yds. of earth excavation; 20,240 cu. yds. of earth filling (to be furnished); 530 cu. yds. of concrete (not to be bid for); 45,370 sq. ft. of cement sidewalk.

Watertown, N. Y.—Until 8 p. m., June 3, by Board of Public Works, for furnishing necessary labor and material for paving viaduct over the railroad tracks on Arsenal St. Work includes 1,200 sq. yds.; also for furnishing 55,000 ft. B. M. timber, and plank treated with creosote; for painting all the iron and steel work on the bridge. E. W. Sayles is City Engineer.

Wadesboro, N. C.—Until 3 p. m., June 3, by Mayor and Commissioners, for the improvement of streets. The work includes: 18,000 sq. yds. of 8-in. macadam, using tar or asphalt as a binder; 2,500 lin. ft. of combined concrete curb and gutter; 6,000 sq. yds. cement sidewalks; 4,000 cu. yds. excavation. White & Piatt, Durham, N. C., are the Engineers.

Concord, N. H.—Until 1 p. m., June 3, by H. C. Hill, State Highway Engineer, for the construction of 4,000 lin. ft. of native stone highway in Hinsdale, N. H.

Canton, O.—Until 10 a. m., June 20, by Commissioners of Stark County, for draining, grading and paving with brick, 3.06 miles of road in Canton and Osnaburg Townships. J. H. McConnell is County Auditor.

Cincinnati, O.—Until noon, June 3, by County Commissioners, for the resurfacing under Specification No. 50, Montgomery Pike, from Cypress Ave. to the north line of Kennedy in Columbia and Sycamore Townships. Fred Dreihs is Clerk.

Delaware, O.—Until 1 p. m., June 11, by W. F. Whittier, County Surveyor, for the construction of the C. C. Wright Road in Scioto and Thompson Townships and extends from the bridge at Bokes Creek to the Mink St. road, about 1 mile in length. The work includes grading, draining and graveling.

Delaware, O.—Until 3 p. m., June 11, by W. F. Whittier, County Surveyor, for the construction of Moss Road in Genoa Township, from Galena and Westerville Road west to the Africa and Westerville Road. The work includes grading, draining and macadamizing.

Maumee, O.—Until noon, June 13, by George V. Raab, Village Clerk, for furnishing necessary labor and material for paving with vitrified brick or block, asphalt block, sheet asphalt, bitulithic, Westrumite, carbovia or bituminous macadam and otherwise improving Wayne St. from Waite Ave. to Kingsbury St. The work includes approximately 13,633 sq. yds. of paving and filler; 7,520 lin. ft. of curb, both straight and circles; 12,226 cu. yds. of excavation, price for which is included in the paving; 372 lin. ft. 8-in. sewer pipe, laid; 220 lin. ft. of 10-in. sewer pipe, laid; 1,600 lin. ft. 12-in. sewer pipe, laid; 7 manholes, complete, with covers and steps; 5 catch basins, complete, with cover and iron trap; 15 inlets, set on necessary brick or concrete foundation; 360 lin. ft. of retaining curb (headers).

Emsworth, Pa.—Until 4 p. m., June 2, by M'Bride Sur. & Eng. Co., Ltd., 708 Fitzsimmons Bldg., 331 Fourth Ave., Pittsburg, Pa., for grading, subgrading and paving Center Ave., from the easterly line of Emsworth Borough to Hazlewood Ave. The work includes approximately 4,000 cu. yds. of grading, 9,800 cu. yds. grading and 775 ft. of rough curb.

Superior, Wis.—Until June 14, by County Board, for the construction of a road to the steel plant.

Winnipeg, Man.—Until 11 a. m., June 1, by Board of Control, Winnipeg, Man., for constructing granolithic walks on portions of 20 streets. M. Peterson is Secy. of the Board.

Sewers.

Bids are asked on following work, the notes being arranged alphabetically by states:

Knoxville, Ia.—Until June 6, by City Clerk, for the construction of 4,925 ft. of 8-in. pipe with 4-in. drain tile, 13 manholes, 2 combined manholes and flushtanks and 1 flushtank. Hall & Adams, Centerville, Ia., are Engineers.

New Hampton, Ia.—Until 7:30 p. m., June 1, by E. B. Strike, City Clerk, for the furnishing and laying in open sewer ditch, 3,000 ft. 4-in. cast iron water pipe and the furnishing and setting of three 4-in. gate valves, crane, three 4-in. by 6-in. Mathew's double hydrant with frost case.

Louisville, Ky.—Until noon, June 10, by Commissioners of Sewerage, for the construction of Section "C," Northeastern Sanitary Trunk Sewer, Contract No. 69. The work consists of the construction of 1,830 ft. of 24-in. plain concrete sewer, 540 ft. of 20-in. vitrified pipe, 909 ft. of 18-in. vitrified pipe, including 3,299 ft. of earth excavation, from 2.1 to 15.8 ft. deep, about 270 cu. yds. of concrete and 1,200 cu. yds. rock excavation. J. B. F. Breed is Chief Engineer.

Louisville, Ky.—Until noon, June 10, by Commissioners of Sewerage, Equitable Bldg., Louisville, Ky., for the construction of a sewer known as Section "D," Northeastern Sanitary Trunk Sewer, Contract No. 70, of the Comprehensive System of Sewerage, Louisville. The work includes building a sewer 15 in. to 22 in. in diameter, total length about 3,369 ft. and from 5.6 to 12.4 ft. deep, and including 20 cu. yds. of concrete, 3,369 ft. of vitrified pipe from 15 in. to 22 in. diameter, and 700 cu. yds. of rock excavation. P. L. Atherton is Chairman and J. B. F. Breed is Engineer.

Hubbell, Mich.—Until 8 p. m., June 1, by Richard Cuddihy, Village Clerk, for the furnishing of 300 ft. of 30-in. sewer tile; 100 ft. of 8-in. sewer tile; 1 "Y" 30x30 ins.; 1 "Y" 30x30x20 ins. and one reducer 30x18 ins.

Owosso, Mich.—Until June 3, by City Clerk, for the construction of about 10,000 ft. of 8-in. and 10-in. sanitary sewer. Official advertisement of the work will be found elsewhere in this issue.

Crete, Nebr.—Until 2 p. m., June 20, by F. A. Novak, City Clerk, for the necessary labor and material for the installation of a sewer system in this city. The said sewer system shall consist of: 19,071, more or less, linear feet 8-in. pipe sewer; 10,376, more or less, linear feet 10-in. pipe sewer; 5,776, more or less, linear feet 12-in. pipe sewer; 4,983, more or less, linear feet 30-in. pipe sewer. P. A. Edquist, 832 New York Life bldg., Omaha, Nebr., is Special Engineer. Official advertisement of the work will be found elsewhere in this issue.

O'Neil, Nebr.—Until 8 p. m., June 14, by H. J. Hammond, City Clerk, for necessary material and labor for the construction complete of a sanitary sewer system. The Consolidated Engineering Co., 640 Bee Bldg., Omaha, Nebr., are the Engineers. Official advertisement of the work will be found elsewhere in this issue.

Freehold, N. J.—Until 11 a. m., June 22, by Charles H. Butcher, Town Clerk, for the extension of sewerage system and the construction of pumping stations. The work includes approximately 81,000 ft. of 8-in. sewers; 3,400 ft. of 4-in. iron pipe force mains; 3 pumping stations, not including houses and machinery; manholes, lampholes, flush tanks. Alex L. Moreau is Commissioner.

Binghamton, N. Y.—Until 4 p. m., June 1, by Board of Contract and Supply, for the construc-

tion of vitrified pipe sewer with necessary manholes, catch basins and lot connections to the curb line in Charles St.; laying both a sanitary and surface water vitrified pipe sewer with the necessary manholes, catchbasins and lot connections to the curb line in Oak St. and Gaines St.; laying a vitrified pipe sewer with the necessary manholes, catchbasins and lot connections to the curb line in Maiden Lane.

Brooklyn, N. Y.—Until 11 a. m., June 8, by Borough President, room 2, Borough Hall, Brooklyn, N. Y., for 13 sewer contracts, the largest being for the construction of sewer in 49th St., between 15th and 17th Aves., and an outlet sewer in 17th Ave., between 49th and 50th Aves. The contract including: 260 lin. ft. of brick sewer; 1,635 lin. ft. of 18-in. pipe sewer; 1,535 lin. ft. of 6-in. house connection drain; 18 manholes; 5 sewer basins; 1,000 ft. B. M., sheeting and bracing; 1,450 ft. B. M., foundation planking. Alfred E. Steers is Borough President.

Brooklyn, N. Y.—Until 11 a. m., June 8, by Alfred E. Steers, Borough President, for furnishing all the necessary labor and materials for the construction of a sewer in West 17th St., between Neptune and Canal Aves. The work includes the following approximate quantities: 692 lin. ft. of 8-in. pipe sewer; 954 lin. ft. of 6-in. house connections; 4 manholes complete; 2,400 ft. B. M., planking.

Cleveland Heights, O.—Until noon, June 14, by H. H. Canfield, Clerk of Village, for furnishing necessary labor and material for the construction of sewers in Maple Road, from Mayfield Road to Wood Road.

Cleveland, O.—Until noon, June 9, by Ira O. Hoffman, Secretary, Board of Public Service, for the construction of sewers in streets as follows: West 89th St., from Madison Ave. N. W. to 700 ft. Southerly; Lakeview Road, N. E. from Primrose Ave. N. E. to 450 ft. South of Osceola Ave., N. E. with temporary outlet into Parkwood Drive, N. E. That part of Eddy Road N. E. from Lake Shore & Michigan Southern Railroad to St. Clair Ave. N. E., which lies between Lake Shore & Michigan Southern Railroad and Sellars Ave., N. E. (so-called). McElhatten Ave. N. E. (formerly Florence St.), from East 136th St. to East 140th St.

Jefferson, O.—Until noon, June 1, by Village Council, for the necessary labor and materials for the construction of a sewage disposal plant. T. B. Miller is Clerk.

Lorain, O.—Until noon, June 7, by Director of Public Service, for the necessary labor and material for the construction of sewers in streets as follows: Elyria Ave. sanitary sewer from E. 28th st., southerly to E. 32d St.; Pearl Ave. sanitary sewer from the present end of the National Tube Company's sewer, thence southerly to a point about 175 ft. north of the center line of E. 28th St., thence along Pearl Ave. to the alley south of E. 32d St. L. B. Johnston is Clerk.

Marcus Hook, Pa.—Until 8 p. m., June 6, by Borough, for the construction of terra cotta pipe sewers, the erection of a pumping station and the grading and straightening of Market St. A. F. Damon, Jr., Post Office Bldg., Darby, Pa., is Engineer. W. E. Mallon, Marcus Hook, Pa., is Chairman of the sewer committee.

York, Pa.—Until 4 p. m., June 6, by Board of Public Works, for the construction of the following sewers: Carlisle Ave., 610 ft. of 8 in. terra cotta pipe; 440 ft. of 5 in. terra cotta pipe laterals; 23 ⅛ bends; 23 double Y's; 1 manhole; 1 flush tank; 40 ft. of 8 in. terra cotta pipe; 66 ft. of 5 in. terra cotta laterals; 4 ⅛ bends; 4 double Y's. South Queen St., 250 ft. of 8 in. terra cotta pipe; 1 flush tank; 892 ft. of 5 in. terra cotta pipe laterals; 44 ⅛ bends; 44 double Y's. Madison Ave., 1,532 ft. of 8 in. terra cotta pipe; 1,566 ft. of 5 in. terra cotta laterals; 3 manholes; 1 flush tank; 75 ⅛ bends; 75 double Y's. Manchester St., 450 ft. 8 in. main; 108 ft. 5 in. laterals; 9 ⅛ bends; 9 double Y's; flush tank; manhole. Harry Wasbers is Chairman of the Board.

Columbia, Tenn.—Until noon, June 15, by E. E. Erwin, Recorder, for the construction of a sewer system for the city, including 1,450 ft. of 10-in. and 4,250 ft. of 12-in. vitrified pipe, 68 "Y's" and 2,390 cu. yds. of excavation.

Princeton, W. Va.—Until noon, June 8, by city, for the construction of sanitary sewers with small amount of 24-in. cast iron pipe and of vitrified pipe of sizes 10, 12, 15, 18, 20, 22, 24, 27 and 30-in. with necessary manholes and lampholes. F. R. Van Antwerp, Princeton, W. Va., is Chief Engineer.

Milwaukee, Wis.—Until 10:30 a. m., June 3, by Board of Public Works, for the construction of sewers in the West Sewerage District as follows: Pipe sewer in Elm St., from a point 12½ ft. west of 46th St. to a point 12½ ft. east of 47th St., and in 47th St., from a point 12½ ft. south of Elm St. to Elm St., and in Elm St., from 47th St. to a point 12½ ft. east of 48th St.

Winnipeg, Man.—Until 11 a. m., June 1, by Board of Control, M. Peterson, Winnipeg, Man., Secretary, for the construction of sewers in portions of 20 streets.

Water Supply.

Bids are asked on following work, the notes being arranged alphabetically by states:

Animas City, Colo.—Until 6 p. m., June 14, by Pearl Roberts, Town Clerk, for the necessary labor and material for the construction of a system of water supply for the town.

North Chicago, Ill.—Until 10 a. m., June 14, by Bureau of Supplies and Accounts, Navy Department, Washington, D. C., for the construction of extensions to water mains, sewers, drains, heating and electrical distributing mains and concrete conduit at this station.

Lawrence, Kan.—Until 5 p. m., June 6, by F. D. Brooks, City Clerk, for the construction and extension of sewers throughout the city.

Hazlehurst, Miss.—Until June 7, by E. M. Cook, Mayor, and Board of Aldermen, for the construction of a reinforced concrete reservoir 40 to 50 ft. in diameter with a capacity of not less than 250,000 gals. of water.

Harrison, N. Y.—Until 4 p. m., June 14, by Board of Water Commissioners, for constructing water supply system, including 1 well, 1 pump, 2 triplex pumps, 2 induction motors, 1 elevated tank and approximately 21,000 lin. ft. of water mains with gate valves and hydrants. John M. Farley is Engineer.

Olean, N. Y.—Until 8 p. m., June 8, by Board of Water Commissioners for the trenching, laying and backfilling for the construction of approximately 3,100 ft. of 18-in. water line and 580 ft. of 6-in. line. Charles Keeman is Secretary.

Tyrone, Pa.—Until 2 p. m., June 10, by Tyrone Gas & Water Co., for the construction of a storage reservoir; also for an addition to its present reservoir known as No. 1. The work includes about 100,000 cu. yds. of earth work and about 2,000 cu. yds. of paving, masonry, etc.; also about 7,000 cu. yds. of puddle work.

Milwaukee, Wis.—Artesian Well.—Until 10:30 a. m., by Board of Public Works, for the construction of an artesian well on the grounds of the Municipal Tubercular Hospital in the Town of Wauwatosa, Wis.

Cheyenne, Wyo.—Until 2 p. m., June 21, by Water and Sewerage Committee, for the construction of a reinforced concrete lined reservoir, requiring approximately 2,800 cu. yds. of concrete and 55 tons of reinforcement. Official advertisement will be found elsewhere in this issue.

Winnipeg, Man.—Until 11 a. m., June 1, by Board of Control, M. Peterson, Winnipeg, Man., Secretary, for the construction of water mains in portions of 16 streets.

Miscellaneous.

Bids are asked on following work, the notes being arranged alphabetically by states:

Washington, D. C.—Inspection Car.—Until June 3, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for furnishing one gasoline inspection car.

Washington, D. C.—Storage Balconies.—Until noon, June 8, by Bureau of Navigation, Navy Department, Washington, D. C., for the construction of storage balconies in boat house at the naval training station, Great Lakes, North Chicago, Ill.

Idaho Falls, Ida.—Hydro Electric Plant.—Until 3 p. m., June 17, by T. H. Hines, City Clerk, for the necessary labor and material for the construction of a hydro electric plant and pumping station. Louis C. Kelsey is Engineer.

Ottawa, Ill.—Retaining Walls.—Until 5 p. m., June 7, by City Council, Benjamin F. Krouse, Clerk, for the construction of four concrete retaining walls, containing approximately 1,775 cu. yds., four cement block balustrade walls, total length 1,120 ft.; for certain light poles, wiring, lamps, etc.; two concrete sidewalks, total length 585 ft.; 4,210 cu. yds. of earth embankment inside of retaining walls; 3,000 cu. yds. of earth embankment outside of retaining walls.

Wichita, Kan.—Concrete Dam.—Until noon, June 13, by William Sence, City Clerk, for the construction and material of a concrete dam across the Little Arkansas River, Riverside Park. Bert C. Wells is City Engineer. Official advertisement of the work will be found elsewhere in this issue.

New Orleans, La.—Wharf.—Until 7:30 p. m., June 14, by Board of Commissioners of the Port of New Orleans, 601 Hibernia Bank and Trust Co. Bldg., for the construction of the William A. Kernaghan Wharf, the lumber and piling to be furnished by the Board.

New Orleans, La.—Towboat.—Until 11 a. m., June 24, by Maj. H. Burgess, U. S. Engineers, for the construction and delivering of a steel hull sternwheel towboat Teche.

New York, N. Y.—Pier and Bulkhead.—Until noon, June 6, by Commissioner of Docks, Department of Docks and Ferries, for furnishing all labor and material for the construction of a new pier at the foot of Oliver St.; also for preparing for and building a new bulkhead platform westerly from said pier between Jame Slip and Oliver St., East River Borough of Manhattan.

Boston, Mass.—Wall.—Until 11 a. m., June 25, by R. C. Hollyday, Chief of Bureau of Yards & Docks, Navy Department, Washington, D. C., for repairs to north foundation wall, building No. 114 at the United States Navy Yard, Boston, Mass.

Boston, Mass.—Crematory.—Until 11 a. m., June 18, by R. C. Hollyday, Chief Bureau of Yards and Docks, Navy Department, Washington, D. C., for the construction of a refuse kiln at the Navy Yard, Boston, Mass.

Newburgh, N. Y.—Dam.—Until 7 p. m., June 6, by Board of Water Commissioners, for the raising of an earth dam and roadway, building concrete, masonry, stone, riprap, walls and slope paving and other work incidental thereto, including approximately: 4,000 cu. yds. earth excavation; 37,000 cu. yds. earth embankment; 3,450 cu. yds. puddle wall; 4,250 cu. yds. broken stone lining; 11,000 sq. yds. slope paving; 550 cu. yds. riprap walls; 500 cu. yds. concrete masonry and other work.

Newport, R. I.—Sea Wall.—Until 11 a. m., June 18, by R. C. Hollyday, Chief Bureau of Yards and Docks, Navy Department, Washington, D. C., for the construction of a rubble sea wall at the United States Naval Hospital, Newport, R. I.

Newport, R. I.—Break Water.—Until 11 a. m., June 23, by Lieut. Col. J. C. Sanford, U. S. Engineer, Newport, R. I., for the repairing of the breakwater at Sakonnet Harbor, R. I.

Wheeling, W. Va.—Boat.—Until 11 a. m., June 22, by Capt. F. W. Altstaetter, U. S. Engineers, for building quarter boat No. 28 and a hull for snag boat Capt. in Turtle for the Kanawha River improvement.

Ottawa, Ont.—Wharf Improvement.—Until 5 p. m., June 20, by Napoleon Tessier, Secy. Department of Public Works, Ottawa, Ont., for the extension of the Sault Ste. Marie Wharf.

Ottawa, Ont.—Port Improvement.—Until 4 p. m., June 3, by L. K. Jones, Secy. Department of Railways and Canals, Ottawa, Ont., for the improvement of the entrance to Port Colborne on the Welland Canal.

Excavation, Earth and Rock.

Bids are asked on following work, the notes being arranged alphabetically by states:

Wheaton, Ill.—Until 8 p. m., June 20, by A. L. Webster, City Engineer, for the deepening and widening of the South Side Drainage Ditch for a distance of 6,000 feet below the Septic Tank, ditch to be 6 ft. wide on bottom and 1 ft. to 1 ft. slope. Official advertisement will be found elsewhere in this issue.

New York, N. Y.—Dredging.—Until noon, June 27, by Col. W. M. Black, U. S. Engineer, 710 Army Bldg., New York, N. Y., for dredging in Newtown Creek, N. Y., and Wallabout Channel, N. Y.

Memphis, Tenn.—Levee Work.—Until noon, June 18, by Mississippi River Commission, First and Second Districts, U. S. Engineer Office, Custom House, Memphis, Tenn., for the levee work in Reelfoot and White River districts. Maj. M. L. Walker is the United States Engineer.

Milwaukee, Wis.—Dredging.—Until 10:30 a. m., June 6, by Board of Public Works, for the dredging of several rivers and canals in the City of Milwaukee. Charles J. Poetsch is Chairman of the Board.

Materials, Machines, Supplies, Etc.

Bids are asked on following work, the notes being arranged alphabetically by states:

Washington, D. C.—Wire.—Until 2 p. m., June 3, by James Wilson, Secy., United States Department of Agriculture, for furnishing and delivering platinum wire.

Washington, D. C.—Sheet Tin.—Until June 2, by Capt. F. C. Boggs, General Purchasing Officer Isthmian Canal Commission, Washington, D. C., for the furnishing and delivering of 200 sheets of bright tin, 20x28.

Washington, D. C.—Bolts, Pipe, Saws, Etc.—Until June 14, by Capt. F. C. Boggs, General Purchasing Officer Isthmian Canal Commission, Washington, D. C., for furnishing under Canal Circular 586, bolts, pipe, saws, valves, dishes, bowls, pitchers, spoons, kitchen utensils, water coolers, milk cans, clothes hampers, oil cloth, towels and aprons.

Washington, D. C.—Steam Shovel Repairs.—Until 10:30 a. m., June 23, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for steel castings, repair parts for steam shovels.

Bluffton, Ind.—Steel Case.—Until 10 a. m., June 9, by County Commissioners, for the furnishing of steel case containing roller shelves and document files. O. D. Garrett is County Auditor.

Fort Leavenworth, Kan.—Road Roller.—Until 11 a. m., June 7, by Capt. William D. Davis, Quartermaster, for furnishing and delivering, f. o. b. cars, at Fort Leavenworth, Kan., one 5-ton tanden style road roller.

Vicksburg, Miss.—Wire and Manila Rope.—Until noon, June 20, by Capt. Clarke S. Smith, Mississippi River Commission, Third District, Vicksburg, Miss., for the furnishing of wire and manila rope, silicon bronze wire, wire strand, spikes, cable clips and wire staples.

Brooklyn, N. Y.—Pump Repairs.—Until 11 a. m., June 8, by Alfred E. Steers, President of the Borough of Brooklyn, N. Y., for furnishing all labor and material necessary for the repair and placing in first class condition two 10,000,000-gal. Worthington sewage pumps, Nos. 1135 and 1136.

Buffalo, N. Y.—Gates, Valves.—Until 11 a. m., June 27, by Col. W. L. Fisk, U. S. Engineers, Buffalo, N. Y., for the erection of steel lock gates, valves and operating machinery for ship lock in Black Rock Harbor at Buffalo, N. Y.

New York, N. Y.—Broken Stone.—Until noon, June 7, by George Cromwell, President Borough

A Periodic Rate Fixing System for Controlling Public Service Corporations.

Men instinctively dislike the corporation that draws royalties forever upon the inventiveness of its founder. This growing revulsion against conditions that permit the indefinite capitalization of brains has culminated in the present movement to regulate the rates of public service corporations. The danger now is that brains will be deprived of nearly all royalties that should come from the exercise of genius in building and operating public service plants.

In our issue of May 25 we showed that the present method of regulating public service corporation rates is to permit only a limited—say 7 per cent—return on the capital invested, thus fostering the policy of expending a greater amount of capital in construction than is really needed, and, at the same time, discouraging all efforts to reduce operating expenses. Clearly, if 7 per cent on invested capital is the limit of returns that brains can secure, it can serve no good purpose to reduced operating expenses, for such a reduction would be followed by a corresponding lowering of the rates.

We also showed that the correct theory of profits is to regard profits as a reward for managerial ability, and not as a return on invested capital. According to this theory, the 4 to 5 per cent interest on invested capital is regarded as a part of the cost of production. The balance remaining after deducting this interest and the operating expenses from the gross income is the *true profit*, which should be expressed as a percentage of the gross income.

We indicated the necessity of limiting this profits by fixing of public service corporation rates of charge at intervals of, say, ten years. So important is this feature of *periodic rate fixing* that we purpose discussing it at greater length.

If rates were automatically reduced so that profits could never exceed a given percentage—say, 10 per cent of gross income—obviously all incentive to reduce operating expenses would be removed. Such a condition would be fatal to any marked advancement in the science of transportation by rail, and American railway management would certainly deteriorate, for the great minds now working in that field would seek other occupation.

To the inventor the Government wisely gives a patent, which protects him for 17 years in the exploitation of the product of his brains. This plan for stimulating efforts in designing machines for economizing labor has proved amazingly effective. But in the use of machines there also comes a chance to exercise originality of a high order. The manager who conceived the plan of paying operators of machines a bonus for increased output was himself an inventor of as great merit as any that ever lived. Yet he made nothing upon which letters patent could be taken out. His only protection was to apply his scheme secretly in some line of business, or to secure control of some corporation having a natural monopoly. The latter, in fact, would be far better than an ordinary patent, for its life would be many times 17 years, aside from the fact that it would not be much subject to the competition of improved machines of the same general type.

We have drawn this parallel between the inventor of patentable machines and the inventor of unpatentable managerial methods to illustrate the essential similarity of the processes of mind involved, and to show that society should provide similar protection and rewards for both classes of inventors. For Edison and Harriman there should be similar inducements, similar protection, and similar rewards. Yet, the one the Government gives a 17-year protection—a protection that is by no means free from possible competition, while to the other is given a perpetual franchise. The franchise, moreover, usually involves entire freedom from competition as regards, at least, a part of the business. In brief, the inventor receives a patent of limited duration, while the managerial genius may secure a perpetual patent. Harriman can capitalize his brains, that is, he can effect economies of operation which, so long as railway rates are not lowered, may become operative perpetually, and thus enable him to sell these annual economies at a price found by dividing them by the prevailing rate of interest. In other words, he can "water the stock." This iniquitous bondage to managerial brains is so grossly unjust that it is certain not to last much longer. But in the revolt now in progress, there are the gravest dangers of governmental action that will destroy managerial incentive at the same time that it destroys the ills in question. The object should be to preserve the incentive that made Harriman a great power for good in the railway world, without giving his brains perpetual royalties. How can this be done?

We have already shown how it can not be done, for the existing public service commission method of limiting profits to 7 per cent on invested capital must prove fatal to managerial ambition. In seeking a method of preserving incentive, we have not far to look, for a consideration of the parallel between Edison and Harriman leads us to a logical solution of the problem.

The rates charged by all public service corporations should be periodically fixed so as to yield only a small true profit at the date of regulation, the time between such periods of rate fixing being, in essence, the term of the patent granted to managerial brains.

Whether the term of this "patent" shall be 10 years or whether it shall be longer, is a matter for further careful consideration. We are concerned now with indicating a rational method of solving this very difficult problem in political economy.

It will be noted that no change in existing laws is needed to put this method of governmental control into operation, for it is universally conceded that public service corporations are inherently subject to governmental regulation of their rates. Our proposed method leaves the ownership of public service plants—railways, lighting plants, etc.—in private hands, and thus insures that careful scrutiny of expenditures in construction and equipment which is so rarely secured when a government owns its own plant. If the government had built our railways, we should have some magnificent specimens of railway architecture, without a doubt—built to last like the Pyramids, and just about as profitable.

It is our belief that rarely should a government of any kind build and equip its public service plants, and never should operate them. Where plants, like waterworks, are now owned by cities, leases should be given to operating companies.

The term of a lease—the "patent"—should be comparatively short, and the water rates should be fixed in advance for the term. All records of operating cost should be under the constant scrutiny of city auditors and should be published annually. At intervals of, say ten years, new rates should be fixed and the operation for the ensuing ten years should be given to the operating company bidding the highest rate of rental for the use of the plant. Who that is familiar with city administration of waterworks can doubt the efficacy of this plan?

We may go much farther in the logical extension of this periodic rate system of government control, and apply it to many classes of government operation now regarded as inseparable from immediate governmental supervision. Our whole post office system, for example, is susceptible of great improvement as to quality of service and particularly as to economy. Both can be accomplished under the plan that we have outlined, and with the greatest ease. What president of a large railway could not make a dozen fortunes for himself in ten years if he were to take over the operation of the post office system, with a hand free to introduce all possible economies? As it now stands, there is a large annual post office deficit, which could unquestionably be wiped out by any capable business manager free to act, and yet driven to act under the powerful stimulant that prospective profits would engender. Nor would service be impaired under such management. In every human probability, the service would be vastly improved.

No system of managerial control of public service corporations is, or can be, free from defects. Occasionally defects of the present system become so great as to merit being called a public scandal. An

Copyright 1910, by the Myron C. Clark Publishing Co. All Rights of Republication Reserved.

excellent illustration of this condition occurred a few years ago in the management of the street railways of New York City, and the public is still suffering the consequences. A study of the underlying cause, however, serves to give added reason for the method of governmental control, which we have just outlined. The stock of these New York City railways was "watered" to a degree rarely attempted even by the most grasping of owners, and the company that undertook to operate most of the consolidated lines in Manhattan, had to pay rentals based on this "watered stock." The income proved insufficient to pay the normal operating expenses plus the rentals on the plant. Hence, the managers adopted the desperate expedient of cutting operating expenses by not making proper repairs to track and rolling stock. The inevitable result was a receivership, and we believe it was this particular receiver who remarked that he had expected to find a "going concern," but when he got it he found it was "almost gone."

The fault in such cases lies not with the system of private management but with a system that permits the immediate capitalization of profits in the form of watered stock. When this is done there is always a possibility that, either by a subsequent decrease in income or by an increase in operating expense, the true profits may be partly, if not wholly, wiped out. If all the true profits at one period have been capitalized, a later period of decreased true profits results disastrously where an operating company is paying rental based on capitalized profits of the earlier period. Our plan of periodic rate regulation, coupled with its concomitant full publicity both of operating cost and of first cost, would completely eliminate all such financial disasters. We do not claim perfection for the plan, but we do claim that it presents a nearer approach to ideal conditions than is secured under the existing system or under any system hitherto proposed. Thus, the benefits of individualism can be had in the operation of public service enterprises without a perpetuation of the bondage that brains now enforce upon the public. No longer will managerial promoters be able to capitalize the annual economies effected by their wits as well as the annual profits arising from the growth of traffic that a growing community yields. By the limited term of fixed rates, however, managerial genius will be placed precisely on a parity with mechanical genius. Our Harrimans will be given patents of no great duration than our Edisons, and both classes will be equally encouraged to exercise all the wit with which nature has endowed them.

Concrete Work at Panama.—Nearly one-eighth of the total amount of concrete to be laid in the Panama Canal locks had been placed at the close of work on May 21, when the total was 531,607 cu. yds—401,112 at Gatun Locks and 130,495 in the locks at Pedro Miguel. The concrete work is advancing at the rate of 4,000 cu. yds. a day and by July 1, when the entire plant at Pedro Miguel will be in operation, the daily rate will be 5,500 cu. yds. At Gatun Locks during the two weeks ending May 21, there were placed 35,022 cu. yds., a daily average of 2,918 cu. yds., the main plant of 8 mixers being in operation about 10 hours a day, and the auxiliary plant of two mixers 8 hours a day. The operation of these two plants for the week of May 16 to 21 was as follows:

	Construction Plant.			Auxiliary Plant.		
Date.	Concrete laid—Cu. yds.	Hours worked.	No. mixers used	Concrete laid—Cu. yds.	Hours worked.	No. mixers used
May 16..	2,040	50:00	6	928	8:15	2

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Results of Tests Made by the Louisville Sewer Commission to Determine Impermeable Mixtures for Concrete.

In connection with the extensive new sewer system being constructed at Louisville, Ky., as described in another column of this issue, tests were made to determine the efficiency of various methods of producing impermeable concrete mixtures. The results of these tests as reported by the commission's engineers were as follows:

TABLE I.—RESULTS OF TESTS OF METHODS OF WATERPROOFING CONCRETE; PRESSURE, 15 LBS. PER SQ. IN.

Specimen.	Seepage (Duration of test, 7 hours.) Cubic inches per sq. in.	Cubic centimeters per sq. centimeter.	Gallons per sq. foot	Total seepage in cu. centimeters.
Perfect Mixture.....	1.53	3.99	3.22	721
Concrete (1-2-4).....	6.30	16.6	13.85	3,000
Concrete with

Concrete with				
Fine sand, 5%.....	4.86	12.65	10.21	2,290
Fine sand, 10%.....	1.20	3.12	2.51	565
Concrete with				
Hydrated lime, 4%.	0.71	1.83	1.48	332
Hydrated lime, 6%.	0.24	0.62	0.50	112
Hydrated lime, 8%.	0.10	0.27	0.22	49
Concrete with				
Medusa, 2%.....	0.92	2.49	2.01	450
Medusa, 4%.....	0.	0.	0.	0.
Concrete with				
Maumee, 4%.....	0.23	0.61	0.49	110
Concrete with				
McCormick	0.17	0.44	0.36	80
Concrete with				
Ceresit	1.98	5.03	4.22	928
Concrete with				
Toxement, 4%.....	0.	0.	0.	0.

The method used for determining the permeability of different concretes was similar to that employed in the Government laboratory for testing structural materials, located at St. Louis. Specimens of concrete were made 10 ins. in diameter and 4 ins. thick. These blocks were placed between iron castings, bolted firmly together in such a way as to allow the application of water under different pressures to a surface 6 ins. in diameter. In order to provide water at definite pressure, an air-tight iron tank containing filtered water was connected with another tank containing compressed air. The pressure was communicated from the air tank to the surface of the water in the other tank from which pipes properly controlled by valves conducted the water to the specimen.

In Table I are given the amount of seepage through the different specimens examined. These tests were made upon concrete, the constituent parts of which were so proportioned as to form a theoretically perfectly graded mixture; concrete—1 part cement, 2 parts Ohio river sand, and 4 parts Ohio river gravel; to which various commercial waterproofing compounds were added; and concrete in which a portion of the Ohio river sand was replaced by an equal portion of very fine sand and clay. Where hydrated lime, Medusa, Maumee and Toxement were used the amount added was a definite proportion of the quantity of cement used, but the quantity of cement was not reduced. The McCormick compound was furnished already mixed with cement and was said to have been mixed at the time of grinding. The Ceresit was substituted for a portion of the water and in the proportion of 1 to 20.

The dry waterproofing compounds and the hydrated lime were added to and thoroughly mixed with the cement before wetting. The tests covered by Table I were all carried out with a pressure of water of slightly over 15 lbs. per sq. in. and for a period of seven hours. Care was taken to avoid error due to evaporation.

Further tests showed that the quantity of seepage was approximately proportional to the pressure applied and that there was no material cessation after an application of pressure for eighteen hours.

Tests were made to ascertain if the addition of the several waterproofing materials in varying amounts reduced the tensile strength of neat and 1:3 mortar briquettes. The results of this study are given in Table II.

As a result of these investigations, concrete to be used in wet localities has been made by the substitution of 10 per cent of the regular (Ohio river) sand by a like amount of fine molding sand containing some clay. The first test of this mixture was in the reconstruction of a fire cistern in private property. This cistern was filled with water soon after its completion and the leakage was so slight, if there was any at all, that after a period of 48 hours, there was no perceptible reduction in

TABLE III.—RESULTS OF PARTIAL ANALYSIS OF WATERPROOFING COMPOUNDS.

Waterproofing Compound.	Character of Compound.	Chemical Analyses (per cent). Volatile combustible matter.	Water.	Remainder.
McCormick	Dry	2.02	.....	97.98
Ceresit	Liquid	38.00	43.60	18.40
Maumee	Dry	17.60	.....	82.40
Toxement	Dry	17.50	.....	82.50
Medusa	Dry	34.03	.....	65.97

the height of water in the neck of the cistern, 21 ins. in diameter. The cistern was 10 ft. in diameter and contained a depth of 13 ft. of water. Since this test several sewers have been built of concrete made in this way with uniformly satisfactory results, so far as it has as yet been possible to test the structures.

Partial analyses of several waterproofing compounds were made to determine the proportion of volatile and combustible matter and water contained in them. The results of these analyses are given in Table III.

Concrete as a Fireproof Building Material.*

It has long been realized that, with the wood supply of the world constantly diminishing, wood was bound to become too expensive to use as a building material. But it is not so widely realized that the day when wood is as costly as non-combustible building materials is here. Today, concrete structures, and in some localities other non-combustible structures, can be erected at no greater first cost than wooden ones; with an added element of safety to those who use the building which cannot easily be overestimated.

In order to hold the place it claims—that of the cheapest and best fireproof construction material—concrete must be able to show itself cheapest in first cost, as well as cheapest in the long run.

Concrete materials are obtainable everywhere: Stone, ledges, gravel, sand, burnt ballast, slag, brick refuse, terra cotta chips, stone cutters' refuse and cinders, are all good aggregates for concrete.

As far as the cost of the labor of putting the material in place is concerned, much has been done toward reducing that to a minimum. With metal forms and certified concrete, concrete construction is cheaper today than that with brick, hollow terra cotta tile or any other material.

Charles T. Main, a member of the Society, has recently published the most valuable contribution regarding cost data of brick and wood mill construction (Eng.-Contg. Feb. 23, 1910). Mr. Main is a leading authority on this subject, and his data are conceded to be correct. Mills have been built entirely of concrete, in all parts of the country, in less time than it is possible to build them of brick and wood and for less money than the square foot and cubic foot prices collected by Mr. Main. A few years ago this statement would not have been true. Today, with the aid of new designs, new methods, new forms, scientific grading and proportioning, it is a fact that cannot be disputed, but one, nevertheless, not generally known.

The development of the entire concrete building and of the parts of the concrete building have been slow, because it has taken a long time to learn to think in concrete. Each student brought his stock of experiences from another field to bear on the problem, but the problem was so new that few could understand it in all its aspects. The engineer, who knew how to design the strength, knew little about artistic features. The architect, who alone could give beauty to the building, was not an expert in the methods that make low costs. Progress was made more difficult by the fact that so few of the structural features and construction methods were standardized.

The contractor, having analyzed his costs, saw that the forms were the largest single item in the cost of the concrete. This fact had its effect on the design of the concrete building, in the trend toward straightway repetition form work and flat-slab ceilings, with as little beam and girder work as possible. A further benefit was in the fewer corners for fire to attack or for interruption of the action of sprinklers, saving also in the cost of the sprinkler system.

After the flat-slab ribless type of ceiling, with its low cost of forms, came standardization of the units of forms for walls and columns. With the use of these metal form-units a new problem faced us, namely, slight modification of design to agree with the cheapest labor requirements of the metal forms. The influence was also felt, of the fire protection design thoroughly worked out and standardized by Charles L. Norton, professor of heat measurements at the Massachusetts Institute of Technology and engineer in charge of the engineering experimental station of the Factory Mutual Fire Insurance Companies. Mr. Norton's recommended practice, which is now universally accepted, is so simple and apparently so obvious that we sometimes forget to give him the credit for his work.

The importance of the forms, from the standpoint of economy, in being able to build fireproof buildings for the price of brick and wooden mill construction, is clearly shown by the fact that Charles D. Watson, of Syracuse, N. Y., on account of the reduction in the number and expense of forms, has been able to build a number of buildings from separately cast members and reduce the costs below anything ever cast in situ in wooden forms.

We come now to the latest developments, the metal form-units that have been perfected, densifiers for compacting the concrete, mechanical conveyors for displacing the wheelbarrow and hand tamping, and the concrete-producing factory, centrally located. These things have all arrived. Metal molds have reduced the price of concrete to that of wooden construction.

For the greatest saving in the cost per cubic foot of the completed building, the methods of construction, as well as the designs, must be standardized. This is rapidly being done. For example, the metal forms are set up and concrete is hauled in large quantities from a centrally located factory and poured at once for the entire story of a building. This does away with the joints between the work of two different days, and permits of figuring the tensile strength of the concrete in design calculation, with a great consequent saving of reinforcement. Such calculations cannot be safely figured unless the whole story is poured at once.

Figuring the cost of furring, lathing, plastering, interest, fixed charges, heating, and repairs, concrete is certainly cheaper than wood. If you also figure health, concrete is very much cheaper. A concrete building is cooler in summer and warmer in winter than any other kind. It can be cleaned out with a hose. It can be easily, quickly and thoroughly fumigated, room by room, or all at once. It is drier than any other, provided it is built with self-ventilating air spaces in all of the exterior walls. A concrete building is vermin-proof, and should germs or vermin get in the building, it may be easily rid of them.

It may seem that we have wandered from our subject of fires and their permanent elimination, but it was necessary to show that concrete is thus, from every standpoint, cheaper than wood, its only rival for low cost. Concrete construction is the best form for the elimination of fires, because it affords: (a) Least cause for fires; (b) least amount of damage to structural parts by fire; (c) least amount of damage to structural parts by water; (d) least amount of damage to contents of building by water; (e) least quantity of combustible structural materials in a room; (f) least speed of combustion of the contents of a room; (g) no concealed fires; all fires are in plain sight; (h) least spread of fire to adjoining parts of the same story; (i) least spread of fire to stories above; (j) least spread of fire to next buildings.

The causes of fires this paper will not discuss. The amount of damage done by a fire in a concrete building depends upon circumstances perfectly within our control and predeterminable. With concrete made of properly selected fire-resisting materials, practically no damage is done, except by prolonged high temperature. The results of recent tests by Prof. Ira H. Woolson, a member of the Society, and his assistant, J. S. Macgregor, prove conclusively that a concrete building properly designed, with as few projecting corners as possible, will withstand long periods of the hottest hardwood fires, with no resulting damage that cannot be thoroughly repaired with mortar and a plasterer's trowel. These tests were on full-sized rooms with walls of concrete made of different kinds of material.

Concrete for walls can be poured in metal molds with sufficient accuracy to permit of painting or wall-papering without further plastering or smoothing. This means that the best of this fire-resisting material is brought to the very surface of the wall where the flames strike. With metal molds all corners can be made rounded as cheaply as square, or metal corner beads may, if desired, be inserted and retained in the molds. Now, if a fire does occur in a building made of concrete cast in smooth metal forms, the damage is less than in any other type of building and the danger of spreading is less.

A concrete building can be damaged by water less than any other form of construction. To begin with, water does not injure concrete; in fact it improves its quality. There is no wood to swell, and afterwards to shrink and crack the plastering. Even the paint best suited to be used on concrete lends itself particularly well to washing down with water. There are no hollow spaces that the water can flow through, damaging the contents below. A concrete building is water-tight from floor to ceiling, and small quantities of water can be easily handled through small scuppers, either into the air space of the vaulted wall, or through the wall to the outside. The fire is never hidden by the construction; consequently no unnecessary streams of water are flooded into the building.

In a concrete structure there need be little or no combustible material. Let us take for example the dwelling house, for it is the most difficult to make both cheap and fireproof. In a concrete residence there is little trim that cannot be made better and cheaper of Portland cement than of wood. The chair rails and picture molding can be made of concrete. The trim around the windows and doors can be molded in metal molds as cheaply as straight members. Even the wire moldings can be done away with, and the conduits buried in the concrete partitions, walls, ceilings and floors. Baseboards should be made of concrete or else omitted entirely—as they serve no useful purpose in a concrete building, except in following wooden precedents. Windows may have cement sashes, with wired glass, and self-closing shutters, or self-dropping shutters of rolled-up metal or asbestos. Metal furniture may be used. The paint and varnish used on buildings and furniture should be selected carefully, as these are great factors in determining the temperature at which a fire will start and the speed with which it will spread. There is also a great difference in the paints and varnish used for painting concrete.

The flooring need not be of wood. There are many first-class non-combustible materials beside Portland cement that will fill every good requirement of wood and still be fireproof. There are also parquetry floorings, made of slow-burning wood, and much thinner than the old-fashioned hardwood floor, which make the best flooring in case wooden floors are desired. In a concrete residence there is no excuse for wooden underflooring nor for wooden screeds.

The best form of construction for the elimination of fires is one that keeps the fire in plain sight, once it is started. One of the greatest obstacles in fighting fire in wood construction is the difficulty of locating a fire after it is known to exist. Every second of time lost gives it accelerated fury. Holes cut through the walls, floors and ceilings to locate a fire oftentimes only furnish more drafts to feed the flames.

With hollow concrete blocks, or monolithic cast-in-place walls and partitions there are no chances for the fire to be concealed. There is no cause for cutting into the partitions, floors or ceilings. There is no damage to the structure from cutting, no injury from water. With such a building, if a fire does start, it starts in plain sight, remains in plain sight at all times and can be attacked instantly before it has spread; and the water damage will be practically nothing. Fires in plain sight are usually extinguished before the arrival of the fire department.

*A paper by Frank B. Gilbreth, General Contractor, New York City, read before the American Society of Mechanical Engineers.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Some Notes on the History of the Rock Drill.

BY W. L. SAUNDERS.*

The rock drill is an American invention, conceived and developed in the United States. J. J. Couch of Philadelphia took out the first practical patents in 1849. In his experiments he was assisted by Jos. W. Fowle. The Couch drill was a crank-and-fly-wheel machine. Couch and Fowle separated in 1848, the latter filing a caveat in 1849 covering a drill of his own invention and describing the successful power rock drill substantially as it is today. The most important feature of Fowle's drill is that the cutting tool was attached directly to the piston. In other words, the steel leading into the hole was an extension of the drill piston rod. Fowle described this invention in his testimony before the Massachusetts Legislative Committee in his contest with Burleigh in 1874, as follows:

My first idea of ever driving a rock drill by direct action came about in this way: I was sitting in my office one day after my business had failed, and happening to take up an old steam cylinder, I unconsciously put it in my mouth and blew the rod in and out, using it to drive in some tacks with which a few circulars were fastened to the walls.

Abroad, the nearest approach to rock drill invention was the work of the German, Schumann, carried on in 1854. Fowle being without means to develop his ideas they remained in obscurity until Charles Burleigh purchased his patents and produced the Burleigh drill, about 1866. This drill was used in driving the Hoosac Tunnel in Massachusetts, in 1867.

Following Couch, Fowle and Burleigh, came Haupt, Wood, Ingersoll, Sergeant, Waring and Githens. Githens was the inventor of the Rand Drill.

The Ingersoll Drill was invented in 1871. Simon Ingersoll, a modest, ingenious and honest mechanic, came to New York from Connecticut, bringing with him the models of several inventions. He was riding in a New York horse car one day and was describing one of his inventions to a fellow passenger. Another passenger in the car was John D. Miner who overheard Ingersoll's conversation. Miner was a contractor, engaged with a gang of men on some rock excavation in New York City.

Miner broke into the conversation to ask Ingersoll why he didn't invent a rock drill, telling him that he had a gang of men at work striking a steel with a hammer to make a hole for blasting; that they could put in only about 10 ft. of hole per day; and that he did not see why a machine could not be built that would do the work.

Ingersoll said he could make such a machine and would go at it at once if he had the money. Miner gave him $50 and his card, saying that though he had never seen Ingersoll before, he had an honest face and he would trust him to spend that $50 in building a rock drill. "When you want any more," said Miner, "come to me and I'll give you another fifty."

Ingersoll's first rock drill was built in a shop at Second Ave. and 22d St., New York City, owned by J. F. de Navarro, and was managed by Sergeant and Cullingworth.

One day Henry C. Sergeant saw the patterns for Ingersoll's drill. He noticed that the front head was attached to, and was a part of the cylinder. He told the workmen that they should be in two pieces, and proceeded to saw off the pattern. At first point Ingersoll came into the shop. "What are you doing?" he asked. "I'm making this thing practical," said Sergeant, as he finished cutting off the pattern before Ingersoll could stop him. The result was the first row between Ingersoll and Sergeant and it led later to Mr. Navarro purchasing, on Sergeant's advice, all rights and patents held by Ingersoll. The Ingersoll drill was made with the separate front head as used today.

Mr. Navarro organized the Ingersoll Rock Drill Co., investing $10,000 in the concern. Litigation arose with Burleigh, of Massachusetts, who owned the rights of Fowle and others. However, Mr. Navarro's plentiful supply of funds and his liberal nature, brought about a settlement of the suits, and all the patents became the property of the Ingersoll Rock Drill Co.

The business quickly paid back to Mr. Navarro the $10,000 he had put into it, and in later years he sold his interests to Mr. W. R. Chapin for $525,000. Sergeant sold out because of friction with the management, went West, engaged in mining, returned to New York about 1885, and organized the Sergeant Drill Co.

Early in rock drill developments the Rand brothers, Addison C. and Jasper R., had become interested through their connection with the Laflin & Rand Powder Co. Addison C. Rand formed the Rand & Waring Drill & Compressor Co., later controlled exclusively by Rand and merged with the Rand Drill Co., established in 1871 and incorporated in 1879.

J. C. Githens, superintendent of the Rand Drill Co., invented the "Little Giant" rock drill. He was the originator also of many improvements, notably the double-screw column with column arm, which made practical the application of rock drill to mining and tunneling.

The Sergeant & Cullingworth Co., manufacturing the Ingersoll Drill, the Sergeant Drill Co., and the Ingersoll Rock Drill Co., were merged into the Ingersoll-Sergeant Drill Co. Later on, the Rand Drill Co. and the Ingersoll-Sergeant Drill Co. were consolidated in the Ingersoll-Rand Co., today carrying on the business of all these pioneer concerns. The Rand drill from the beginning had been the most formidable competitor of the Ingersoll and Sergeant types. The conjunction of the Ingersoll-Sergeant and Rand companies, therefore, was a combination of valuable patents in rock drills, compressors and general machinery for mining, tunneling and quarrying.

*President Ingersoll-Rand Co., New York, N. Y.

Some Progress Data and Cost of Driving the South Portal Heading of the Elizabeth Tunnel, Los Angeles Aqueduct.

Last week we gave figures of progress and cost for the Elizabeth Tunnel work on the Los Angeles Aqueduct for the five months, October, 1909, to February, 1910, inclusive. Since then we have received from Mr. J. B. Lippincott, Assistant Chief Engineer, complete figures of progress and cost for the South Portal heading of this tunnel for the month of April, 1910. These figures are notable among other reasons for showing a progress of 604 ft. for one month, which is the American record for hard rock tunneling. This tunnel has now set the record three times for America as follows:

October, 1908..... 466 ft.
March, 1909..... 476 ft.
April, 1910..... 604 ft.

The best records on other work are:

Gunnison Tunnel, January, 1908..... 449 ft.
Chicago Water-works, April, 1909..... 468 ft.

The cross-section excavated at the Elizabeth Tunnel is 12 ft. 4 ins. x 12 ft. 9 ins.; at the Gunnison Tunnel the record was made on a heading section of 8x12 ft. Both tunnels were in granite. The Chicago water-works tunnel was in limestone rock and had a circular excavation section 16 ft. in diameter.

The Elizabeth Tunnel is being driven full section by the lower heading method. Work at the South Portal was begun Sept. 20, 1907, with temporary equipment. New equipment was installed in April, 1908, as follows:

1—150 H. P. Fairbanks-Morse Motor Generator Set to furnish current for the lights and locomotive.

3—Westinghouse 33,000-400 V. 125-K. W. Transformers, together with the necessary intermediate transformers, auto starters, switchboards and meters, for handling both the underground and surface work.

1—No. 5½ Root rotary pressure blower of 4,000 cu. ft. capacity, for ventilation, belt driven by

1—30 H. P. Fairbanks-Morse D. C. Motor.

In August a small machine shop equipment

This blank to be used for reporting "Tunnel Excavation," "Tunnel Timbering" "Conduit Excavation—Hand" and "Conduit Excavation—Shovel." Separate reports should be made for each of these classifications and compiled each ten days and monthly.

was placed in one side of the power house, consisting of 1 small lathe, 1 drill press, 1 circular saw, 1 emery wheel and 1 power hack-saw. These handle all the necessary shop work around the plant.

The tunnel was supplied with the following:

1—2400-pound Draw-bar pull Baldwin-Westinghouse Mine Locomotive.
15—40-foot Koppel side dump mine cars.
4—Model 6 Leyner Air Drills, together with all necessary receivers, water tanks, manifolds, hose, etc., to carry on the work.

The folowing buildings were erected on the ground:

1 power house, galvanized iron, 40x80 ft.
1 blacksmith shop, galvanized iron, 40x40 ft.
1 warehouse and office, galvanized iron, 20x60 ft.
1 barn and feed room, 38x64 ft.
1 blower room, 8x18 ft.
1 mess house, 40x64 ft.
3 bunk houses, 20x68 ft.
1 cottage, 4 rooms.
1 cottage, 3 rooms.
1 hospital, 5 rooms, 30x35 ft.
1 oil tank rack, 4x24 ft.
1 powder thawer, 3x4 ft.
1 powder magazine (tunnel).
1 root cellar (half tunnel), 8x12 ft.

The buildings are comfortable and in good condition, the mess-house and three bunk-houses being painted. The camp is supplied with water from a 45-ft. well, lifted 67 ft. by a No. 2 Gould centrifugal pump driven by a 7½-h. p. Fairbanks-Morse D. C. motor to an 8x16-ft. circular concrete tank reservoir, from which place it is distributed through 1,062 ft. of 2-in. main and smaller laterals to all the buildings. A 1-in. centrifugal pump driven by a 5 h. p. D. C. motor forces the water into a cooling tank, from which place it passes into the circulating system of the transformers and compressors. Fire protection is given by four 2-in. plugs fitted with 400 ft. of woven cotton hose.

This original equipment doubtless stands about the same at the present time. Power is supplied from the Castine substation of the Edison Co.'s Kern River transmission line and is carried to the tunnel over a single pole bare wire lines under a pressure of 30,000 volts.

As is quite generally known, the work is being done by day labor and a bonus system of payment is practiced. The base rate in this bonus system is 8 lin. ft. of tunnel per day, or 248 ft. for a 31-day month. For each lineal foot driven in excess of this amount, each man working continuously in the tunnel during the month is paid 40 cts.

Turning now to the records of the work for April, 1910, the formation was a fairly stiff granite on April 1, increasing gradually in hardness until April 20, when a marked change occurred toward softer material in which feldspar predominated. This made it possible to cut down the number of holes drilled, increase their length and decrease the powder charge. Very little over breakage resulted and no timbering was required. The records of progress during the month were as follows:

Date.	Feet.	Material.
1st to 10th	181	Medium hard granite.
10th to 20th	194	Very hard 8 days; soft 2 days
20th to 30th	229	Medium hard granite.

As will be noted, progress is reported in 10-day periods. This practice is uniform for all the aqueduct work, a uniform blank, Fig. 1, being used. The method of reporting total costs for the month is shown by Fig. 2. From this record for April, 1910, we get the following unit costs for excavation:

Item.	Per cu. yd.
Excavation	$2.84
Mucking	2.08
Drainage	0.02
Ventilation	0.03
Light and power	0.83
Engineering	0.06
General administration	0.29
Equipment and buildings (estimated)	1.57
Total	$7.83

The wage schedule for the tunnel work is as follows, an 8-hour day being worked:

Superintendent, per month	$300.00
Foreman, per month	135.00
Shift bosses, per day	4.00
Miners, per day	3.00
Muckers, per day	2.50
Blacksmith, per day	4.00
Carpenters, per day	$3.00 and 3.50
Mechanics, per day	$2.75, 3.00 and 3.50
Electrician, per month	110.00
Laborers, per day	$2.00 and 2.50
Construction clerk, per month	100.00
Storekeeper, per month	85.00

The following miscellaneous data are sent by Mr. Lippincott for the month covered by the above costs:

Total footage to March 31st	9,134 ft.
Footage during April	604 ft.
Total footage to date	9,738 ft.
Required progress for April	240 ft.
Increase over estimate (bonus)	364 ft.
Average daily footage	20.13 ft.
Required daily footage	8.0 ft.
Bonus daily footage	12.13 ft.
Average progress per shift	6.71 ft.
Required progress per shift	2.666 ft.
Bonus progress per shift	4.044 ft.
Bonus rate per shift, per foot, per man.	$0.40
Maximum bonus earned, per man	$48.52
Cost of bonus per foot of tunnel	$3.93
Number of shifts worked (3 shifts daily)	90
Number of men on bonus crew*	16
Shift boss	1
Miners	6
Muckers	9

*One foreman, who is in charge of all three crews, is also included in the bonus list.

Electrical energy used, K. W. H.	78,379
Energy cost at $0.0185 per K. W. H.	$1,450.02
Number of mules (used at heading to switch cars for electric locomotives)	3
Number of holes drilled	1,924
Total footage of holes drilled	16,079
Feet drilled per foot of progress	26.62
Total time drilling heading, hours	324
Average time drilling heading per foot.

Remedies for Landslides and Slips on the Kanawha & Michigan Ry.*

The southern portion of the Kanawha and Michigan Railway, for 93 miles (from Point Pleasant to Gauley Bridge, W. Va.), is located on the east side of the Great Kanawha River. For about one-third of this distance the road is close to the banks of the river, on a hillside location, where there is practically no valley, the mountains rising directly from the stream. Owing to the character of the soil, there is considerable trouble, due to landslides and slips, the term slips being used where the fill, or embankment under the tracks, settles or slips toward the river.

Excessive rains occur during the winter, and small landslides are numerous, but do little damage; in most cases the water rushing from the mountains brings with it one or two uprooted trees and a few yards of earth. There is much more trouble with the larger landslides, that is, where the whole hillside gradually slips down toward the river, pushing the track ahead of it, and giving bad line and surface. At some places the track is not only pushed out of line but raised.

Landslides occur in almost every case where the hill or mountain side has been cleared of all forest. The top soil, or earth above the rock, which varies in depth from 8 to 20 ft., is mucky clay, which holds water in every low place, apparently being impervious. This clay soil soon becomes saturated, soft, and mucky, and, not having any roots or vegetation to hold it in place, and being on a slope, starts a downward movement, slipping on the rock, covering the ditches and ballast of the track, and pushing it out of line. These so-called landslides do not come down at once, but move slowly, thereby causing no immediate danger. In several places reverse curves have to be given to the alinement, in order to keep the track in surface.

At Point Pleasant, where there was a small landslide, the earth, as it came in, was removed by a steam shovel at the toe of the slope. The soil at this point was slipping on an inclined stratum of rock, the top of which was smooth and had the appearance of soapstone.

In cases where it was impracticable to remove the slide, the top-soil drainage system on the hillside above was at first tried, but did not work successfully, as the ditches, due to the slippery soil, soon filled up. It appeared that the small amount of surface water collecting in the low places caused by the roughened surface was sufficient to cause the slipping.

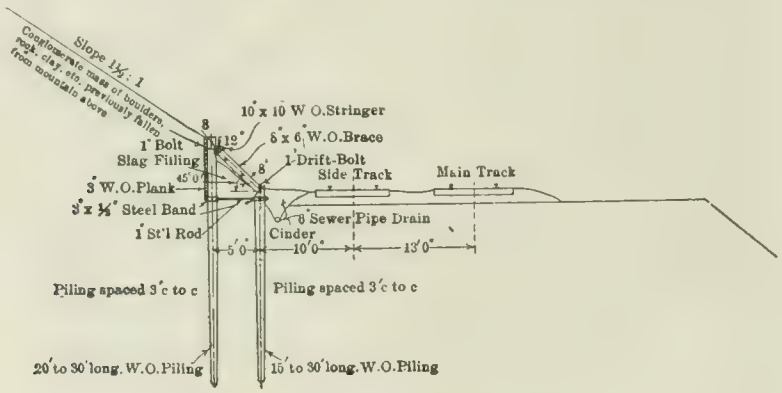

Fig. 1—Pile Brace Against Landslide.

At Leon, where considerable expense was incurred in maintaining the track around a slide, the hillside was removed, and the track, for 2,000 ft., was relocated on the rock bottom, obtained by cutting back to a side-hill location. By this method the entire landslide was removed and the track put on rock bed, thereby doing away with the trouble, at a cost of $20,000.

At Cannelton, where the largest slow-moving landslide occurred, the main track had been pushed out of line. Reverse curves were made, in order to get back to the alinement on either side, but, on account of the continual lining out of the track, the curves became too sharp for operation, and the side track between the hillside and the main track became completely covered. As this slide was of such extent and depth, it was out of the question to remove it in order to get back far enough for a rock sub-grade, as at Leon. The change of line not being feasible, it was proposed to remove part of the landslide, permitting the relocation of the tracks on their original alinement and, after completing this, to protect them from further slides.

A steam shovel was cut in at one end, and removed enough of the landslide to allow the two tracks to be changed to their original location. After the shovel had worked about three days a slide occurred one night, half burying the shovel. Steps were then taken to hold back the hillside before further slides could develop. This was done successfully by driving two parallel rows of piling, 5 ft. apart, about 3 ft. from center to center, as shown in Fig. 1. The upper rows, against the hill, were backed with 3-in. plank, the front rows being driven against this brace in order to aid in supporting the upper row. A 10x10-in. stringer was placed against the upper row, and from this 8x8-in. braces were carried diagonally, at an angle of 45°, to the lower row of piles, and these were sawed off at the ground level. Steel bands, with 1-in. rods to hold the two sets of piling together, were put on about 8 ins. below the top of the brace pile. The depth of penetration of the piling varied from 15 to 30 ft. The piling was selected large white oak, and oak timber was used for the stringers and braces. Moving the shovel ahead about 30 ft., then cutting it back, and driving the piling as shown, constituted a day's operation. The work was completed successfully without further serious landslides. In four weeks about 12,000 cu. yds. of earth were removed, the track was thrown back to its original alinement, and the landslide was stopped. This work cost $16,000.

The upper limit of the slide is about 135 ft. above the track. The slide consists of about 200,000 cu. yds. of moving earth. This work was done in the spring of 1907, and has been successful. At several places, due to excessive pressure, the braces have been embedded in the stringers. The earth from the top of the piling was given a slope of 1½ to 1; at several other points smaller slides have been stopped with one row of piling. The piles were driven 3 ft. c. to c. and cut off 3 ft. above the top of the rail, the ground above being given a slope of 1½ to 1. At one or two places, where one row was not sufficient, the trouble was stopped with brace piling. At points where the single row of piling showed signs of leaning, due to the pressure against that part of the piling above ground, this overturning, apparently due to too much length above ground, was stopped by cutting off the piling 3 ft. above the ground and giving the earth above it a slope of 1½ to 1.

In contending with landslides of this character in West Virginia, all that seems to be necessary is to obtain a good toe hold, which stops the movement of the earth above. The so-called slow-moving landslides on the Kanawha & Michigan Ry. have been stopped successfully by one of these methods.

The term, "slips," as the conventional name indicates, is applied to places where the soil slides into the river. These slips occur when the roadbed is constructed on a fill, ranging in depth from 5 to 10 ft., across narrow flats, between the hill and the river. Due to the constant movement of the earth, no trees grow on the land between the river and the railroad. The ground slips gradually into the river where, from time to time, its toe is cut away by the current.

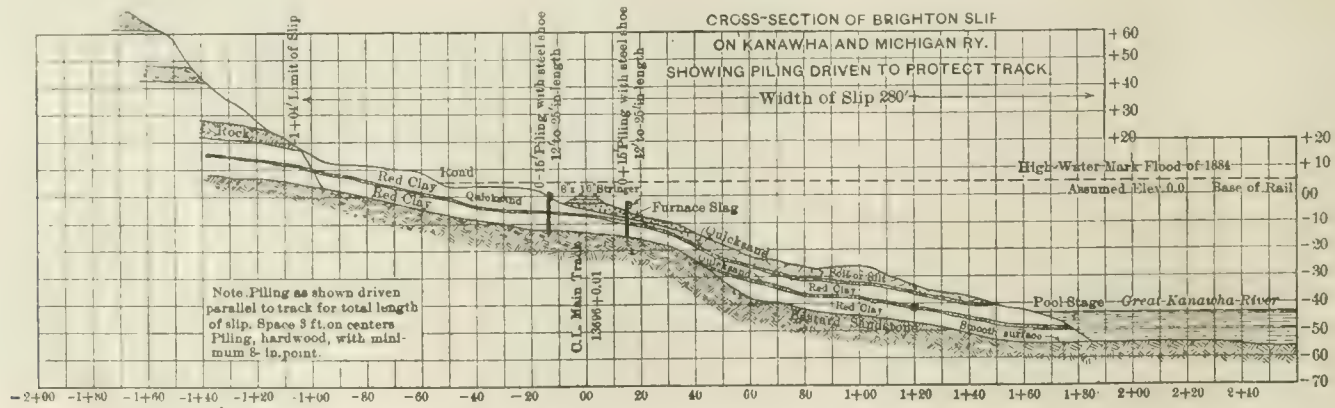

Fig. 2—Cross Section of Brighton Slip Showing Piling Driven to Protect Track.

*A paper by R. P. Black, presented Sept. 7, 1910, to the American Society of Civil Engineers, and published in the "Proceedings," Vol. XXXVI, p. 877.

The peculiarity of these slips is the fact that they may continue for one or more seasons without giving any trouble. Slips are due to high water and not to surface water. A quick rise and fall of the river will not cause the soil to move, but continued high water, or several successive floods, will start the slipping action.

In the spring of 1908, the length of track affected by the slips was 7,600 ft., necessitating, at several different points, the maintenance of speeds ranging from 6 to 20 miles per hour for five months, until the dry season, when this slipping action stopped. In Fig 2 is shown a cross section of the Brighton slip, which gave the greatest trouble. The section is taken at right angles to the track, the information for which was obtained by levels and test rods driven to rock. A stratum of rock, below the earth, slopes toward the river, ranging from 1:0.2 to 1:1. This rock is covered by successive layers of red clay, varying from 3 to 6 ft. in thickness. Immediately above the rock, and in thin seams, from 4 to 8 ins. thick, between the layers of clay, is found a quicksand mixed with fine clay. When the quicksand and fine clay become thoroughly saturated with water, the mixture affords a smooth surface over which the top soil or successive layers of clay slide toward the river. After high water these seams of quicksand can be traced readily by the water seepage. The quicksand is very slimy, and contains no grit. The water must remain over the ground long enough to force its way back into this quicksand and saturate well before the slipping action can take place.

In 1908, in order to keep the track safe, the gangs on four sections were increased from three—the normal force—to ten men each, and these increased forces were maintained for four months. The tracks had to be resurfaced and lined continually. At three different times, it was necessary to put on filling material and ballast in order to keep the track up to grade. This entailed a cost of $4,400 more than the normal expenses for the year. The track over the slips was not only costly to maintain, but dangerous, due to wrecks resulting from derailments on account of rapid settlement of the roadbed.

At Poca, where a trestle was maintained over a slip for about 800 ft., due to the heavy cost of changing the alinement, the trestlework was filled with heavy quarried rip-rap, and the fill was widened so that the stone reached the river's edge. The weight of this stone fill caused settlement, but, after adding stone from time to time for five years, the roadbed became solid. It is thought that the stone fill settled to the rock stratum below the slip, thereby stopping the movement.

For slips at other points where small fills were maintained, several remedies were suggested, one being to construct, at the river's edge, a wall which would act as a toe to hold back the moving soil. Owing to the necessary height of the wall, however, this was deemed too costly. At Brighton and Leon slips, where the alinement could not be changed, the remedy shown by Fig. 2 was proposed, the scheme being to drive two rows of piling, one on each side of the track, with a track-driver, the piling to be equipped with steel shoes for penetrating the rock strata. It was supposed that, with the toe hold in the rock, and the pinning together of the successive moving clay strata, this slipping action in the vicinity of the track would be stopped.

In the spring of 1909, test piling was driven for a distance of 50 ft. in the center of the Brighton slip. Transit observations taken from a base line, showed that the piling did not move any appreciable distance. The track held up well within the limits of the piling where, as on either side, it had been necessary to resurface continually.

The test being successful, two rows of piling were driven during December, 1909, on either side of the track at the Brighton slip, and between its limits, for a distance of 740 ft. The piles were equipped with steel shoes and were driven 3 ft. apart, center to center, on the down-hill side. Continuous 8x16-in. timber bracing was bolted to the piling. The work was done with a self-propelling track-driver. A temporary spur track was constructed at one end of the slip, thus dispensing with the services of a work train. The cost of this work was as follows:

Hardwood piling, 8,075 ft. at 13 cts.	$1,049.75
Steel shoes, 12,690 lbs. at 3 cts.	380.70
Labor	856.35
Fuel, etc.	120.00
Total	$2,406.80

Up to the present time, this remedy has been successful.

At another point, where the rock strata are not at great depth, it is proposed to go down the hillside about 20 ft. from the track, put down holes about every 20 ft., and blast the smooth surface of the rock. Thus, by roughening the surface and destroying the stratification, the sliding of the clay may be stopped.

Annual Convention of the American Society of Civil Engineers.

The following is the program of the annual convention to be held at Chicago, Ill., June 21 to 24, 1910.

Monday, June 20.—An Informal Reception will be held during the evening at the Congress Hotel, in order to enable those who arrive early enough to become acquainted with our Chicago Membership and with each other.

Tuesday, June 21.—10 A. M. First Meeting of the Convention.—John A. Bensel, President, will deliver the Annual Address, at the close of which the Business Meeting will be held. The business to be considered will be as follows: (1) The Time and Place for holding the next Annual Convention. (2) Report of a Special Committee appointed to formulate the general lines which should be followed in legislation affecting the practice of engineers. (3) Report of the Board of Direction in the matter of a proposed Special Committee to report upon the Preservation of Wood.

2. P. M.—Automobile drive through part of the Park System of the City of Chicago, the entire party being guests of the local membership.

8:30 P. M.—Second Meeting of the Convention.—This meeting will be held either in the Florentine Room of the Congress Hotel, or in Fullerton Hall of the Art Institute. Alfred Noble, Past-President, Am. Soc. C. E., will describe the New York Tunnel Extension of the Pennsylvania Railroad, illustrating his description with lantern slides.

Wednesday, June 22.—The day will be devoted to a visit to the new steel plant of the United States Steel Corporation at Gary, Ind., the party leaving Chicago at about 9:30 A. M., either by special train or by steamer. Luncheon will be served during the trip. The steel plant will be inspected, and those who are specially interested will be given an opportunity to inspect the water-works, sewerage and other municipal improvements of this new city. The return to Chicago will be about 4 P. M.

8:30 P. M.—Third Meeting of the Convention.—J. Waldo Smith, M. Am. Soc. C. E., will address the society on the subject of the New Water Supply for the City of New York. The address will be illustrated by lantern slides.

Thursday, June 23.—For this day a number of short excursions to local points of interest will be arranged. Parties will be made up according to individual preference, and will be personally conducted.

The following trips will be arranged for: 1. Excursion to Lockport, to inspect the Regulation Works and Power Plant of the Sanitary Canal. 2. Visit to the Chicago & Northwestern Ry. Passenger Terminal now under construction. 3. Inspection of the plant of the Commonwealth Edison Co. 4. Visit to the new Mail-Order Plant of the Sears-Roebuck Co. This is one of the largest mail-order houses in the world, there being about 8,000 employes. The sanitary arrangements in connection with this plant are especially interesting, as also are the arrangements for filling and shipping orders, which often aggregate 250,000 per day. 5. Visit to the new plant of the Western Electric Co.

8:30 P. M.—Fourth Meeting of the Convention.—An illustrated lecture will be delivered descriptive of the plans recently perfected for beautifying the City of Chicago. After adjournment of this meeting members are invited to a Smoker at the Chicago Engineers' Club.

Friday, 10 A. M., June 24.—This day will be devoted to an excursion. The party will first visit the Army Post at Fort Sheridan, and will then inspect the new Naval Training School at Lake Bluff. Luncheon will be served during the trip, and Ravinia Park will be reached early in the evening. Here dinner will be served and there will be a concert, and probably informal dancing.

Co-Operative Plan of Engineering Instruction Adopted by the University of Pittsburgh.

The trustees of the University of Pittsburgh have adopted a plan of co-operation recommended by the Committee on School of Engineering which is unique and appears to blend most satisfactorily with the engineering environment of this institution. This plan will be put into operation October 1, 1910.

The following is an abstract from the report of the Committee on School of Engineering to the board of trustees:

It has been a matter of common observation in connection with the educating of young men who enter the engineering activities that those who spent their vacations while at school in engineering offices and industrial establishments have been better prepared for entrance upon their life's work than their fellow students of otherwise equal abilities who devoted their time exclusively to school work. The contact with the engineering activities, even in this subordinate way, gives the student of engineering an insight into practical affairs which not only makes him of more immediate use to his employer upon graduation from school, but also fits him to pursue his studies to better advantage while in school.

If the student of engineering is thus benefited by such chance work as he may be able to get during vacation periods, then it is evident that he will be benefited still more by pursuing a systematic course in which the instruction in school is interspersed with suitable outside practical work.

The technical graduate who has taken school work only has no adequate knowledge of the organization which makes it possible for many men of diverse employment to work together as a single unit in the accomplishment of a desired result, or the system that is necessary for tying together inter-related departments for the attainment of economic production; nor does he even know as a beginner how to apply the knowledge at school in a manner altogether satisfactory to his employer.

Because of this unpreparedness of the average technical graduate, a number of large corporations have established student apprenticeship courses for the benefit of such graduates as seek employment with them.

The engineering schools and the companies who employ their graduates are thus working independently in their efforts to prepare young men for entrance upon their life's work. Since both school and future employer have the common aim to fit the young man for efficient service at the minimum of cost in time and money, it is evident that the best results cannot be had by independent action but by co-operation.

The University of Pittsburg, because of its splendid industrial environment, is most favorably situated to apply this co-operative principle to the education of young men who are preparing to enter the engineering industries. Instead of keeping the young man away from the actualities of his life's work for a period of four or more years prior to graduation, as is the general custom of engineering schools, the Committee on the School of Engineering have matured a co-operative plan whereby the student, while spending in school the amount of time usually devoted to instruction in our best engineering institutions will work four terms of three months each in the engineering industries of the Pittsburg district. By this plan the student gets

(Continued on page 529.)

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

The Steam Rolling on Roads, and the Management and Care of Steam Road Rollers.

In Great Britain steam road rollers have been used for many years not only in the construction of new roads, but also in the maintenance of old ones. In Ireland, in particular, much attention is paid to the steam rolling of roads, and practically all of the counties maintain several steam rollers for this purpose. As a result these Irish road engineers have acquired much information regarding the best methods of working road rollers. At the recent Irish Road Congress held at Dublin, Ireland, April 20-22, 1910, the three following papers were read on this subject. In passing it may be noted that in our issue of Sept. 2, 1908, we printed a valuable article on steam road rolling in Ireland, the author of the article being the Mr. Hackett whose paper follows. In our issue of Feb. 16, 1910, we also printed an article giving directions for working steam road rollers and steam traction engines. It should be noted that the costs given in this article have all been transposed from English to American monetary units.

The Steam Rolling of Roads.*

There are very many desirable methods of improving Irish roads, most of which will be discussed at the Congress. Of all these steam rolling is the most effective, and not merely so, but far and away outstrips in importance every other proposed improvement. It is immediate in effect, in many cases gives immediate relief to the rates, and is universally appreciated. It greatly increases the comfort and ease of traveling, enables 25 per cent more loading to be carried, and to greater distances, saves wear and tear on horses and equipment, prevents sore feet in cattle, and is a blessing to farmers, cyclists, and motorists. Besides this it brings other improvements in its train. It searches out weak and badly drained parts of a road, diminishes dust, shows up the evils of sharp corners and of shaded parts of a road, and generally raises the standard of road maintenance. There is now ample proof that steam rolling with the use of proper materials, intelligently and carefully applied, excellent and economical results are obtained. Although steam rolling, properly carried out, will on any road and with any class of materials which has heretofore been used, give better results both from the view of the ratepayer and the traveler than those obtained on the patching system, yet the best results can be obtained only when the other conditions are appropriate.

Slight reflection will enable one to realize the superiority of consolidating stones by a roller over the ordinary patching system. By ordinary patching repairs a smooth surface close in texture cannot be obtained, the result being that water lodges in depressions, eventually soaking into and softening the road and its foundations. With the smooth and nearly impervious surface secured by rolling in the stones the water runs off the road like off the slope of a roof. The greatest practical difficulty met with—before the introduction of rollers—in maintaining roads in good condition, although few people except road surveyors realized it, was not, as is generally supposed, the amount of traffic. This is seen by the fact that on a hill slope or at a cross roads where the traffic is doubled the surface is smooth and sound. The great difficulty was—the tendency of roads to become tracked by wheels. This evil is aggravated by every additional inch in height of the center of the road made for the purpose of throwing off the water; consequently roads made by patching had to be kept comparatively low in the center—too low for effective surface drainage. The cause of tracking is the tendency which horses and vehicles have of following in the track marked by a previous vehicle on a soft and dirty road. With a steam-rolled road the surface is so smooth, hard, and clean, that vehicles leave no tracks on it, and the traffic distributes itself naturally all over the roads, thus doing away with the road-maker's chief difficulty. In addition, it is found that without any danger of tracking the center of the road may safely be raised, thus assisting in the disposal of the water.

A rolled road under any favorable circumstances dries up in half an hour after rain ceases.

Again, it will be found that with stones consolidated by wheel traffic, a large proportion, probably one-third, will be found to have been broken into dust and rendered useless, the surface loose in texture, pervious to water, and composed, when opened up, of a large proportion of mud and small debris of stone.

On the other hand, a rolled surface will be found composed of stones compacted together like a tesselated pavement, presenting a smooth, hard, semi-impervious surface to the traffic and rain.

An observant person will not fail to notice in every county water-channels which have long since ceased to fulfil their original purpose, being now higher than the road which they were made to drain This state of affairs has come not as a sole result, as might at first sight be supposed, of the stones in the road wearing away, but from several other causes.

The inferior original surface permitted the foundations to ooze up and be scraped away in mud. At the same time the traffic on the weak surface caused a grinding action to take place internally in the road, so that there was a wear and attrition of stone going on not only at the surface, but internally. As this latter kind of wear is a novel one to put before a popular audience, it may be stated that it was an unrecognized factor even among engineers until late years. We know practically that a solid foundation was necessary, but till late did not realize why. This wear of stones is of great importance, and accounts, I have no hesitation in saying, in many cases to one-third of the surface wear. With the thick impervious coat of stones put on in rolling, the road becomes so strong and so watertight as to almost entirely prevent the destruction of the stones from percolation of water and internal attrition.

One of the greatest savings effected by rolling is the diminished amount of scraping and sweeping. In practice, under the patching system, it is found that out of every 24 cts. spent on maintenance, 8 cts. to 12 cts. goes in cleaning the road. Such expenditure puts nothing into the road, and is so far waste. With a steam-rolled road this expense is reduced by from 70 to 90 per cent. The importance of steam-rolling in urban districts from this, as well as from a sanitary point of view, is obvious.

From the foregoing comparison of the effects of the two systems one could infer, without experience, that the result of steam-rolling would be superior from every point of view, but it is now desirable to get to actual figures, to see how rolling works out from a ratepayer's point of view. I should, however, interpolate here the necessary explanation that the foregoing remarks and the following figures apply to coating and rolling in a layer of stones about 3 ins. thick all over the road. The system of rolling in patches one stone thick, as represented by the annual supply allotted to the road under the patching system, is one I have tried and do not approve of. It is wasteful under any conditions, as the roller is working three-fourths its time on parts of the road where there are no stones. In winter, with the road soft, it undoubtedly gives a better result than allowing the stones to be beaten in by the traffic, but that condition of the roads does not exist but for short periods even in winter, and when it does not exist the stones are ground to powder.

I now give (Table I) examples of four actual cases of roads steam-rolled in County Tipperary, South Riding, showing how the cost of steam-rolling actually worked out, treating expenditure for that purpose as a financial proposition, and comparing the original price of the road under the patching system with the cost of steam-rolling, and making the assumption that the initial cost of the rolling was borrowed and the money repaid at 3½ per cent, which is the actual state of affairs in my county; the term of repayment corresponding to the life of the road.

The condition of the roads is as follows:

TABLE I.

1. Name of Road.	Ballinlard.	Rathronan.	Racecourse.	Newton Anner.
2. Date when rolled.....	1901.	1901.	1903.	1909
3. Cost per perch under patching system per annum	$0.72	$1.32	$0.30	$1.08
4. Expenditure for rolling per perch	2.80	3.28	2.90	2.76
5. Annual repayment of interest and principal for life of road..	.37	.43	.28	.33
6. Average maintenance subsequent to rolling	.18	.24	.08	.20
7. Totals of Nos. 5 and 6	.55	.67	.36	.53
8. Saving per perch per annum	.17	.65	.00	.55
9. Life in years.....	9	9	13	10

Ballinilard, Rathronan, and Newtown Anner roads are now becoming defective on surface, and throwing up mud. They are, however, much sounder and better than before they were rolled. They should be rerolled within the next year or two, but less materials would now make a good job of them than when they were first rolled.

The Racecourse road is in perfect condition, showing no trace of wear, and perfectly clean. I would not be surprised if its life were 15 to 20 years. On the Motor Reliability Trials last summer the motors passed over this road between Cahir and Cashel; many drivers and passengers will remember its good condition.

It will be noticed, before I pass from this part of the subject, that there is shown by the actual figures a large saving on expensive roads, and that roads costing as low a price as 36 cts per perch can be rolled without money loss. The results far exceed the anticipations which were put before the County Council when this class of work was started.

I now add a few practical remarks derived from my experience: The main streets of urban districts, with a population of 5,000 to 10,000, will have to be rolled every three years, unless a better material than limestone is used, but less materials will be required for the second and subsequent rollings.

Repair, subsequent to rolling, by filling all depressions seen holding water with very small quantities of fine stone, ¾-in. gage or thereabouts—barely enough to fill depressions, and preferably broken stone. For light country roads limestone will give the most satisfactory road, and wears perfectly smooth. For heavier roads use the hardest stone procurable. Subsequent to rolling use sweeping-brushes; a man can cover twice the amount of road and produce cleaner work than he would with scrapers. Sweep, particularly in dry weather, as dust is easier swept than mud. Machine-sweepers are best, as the suitable times for sweeping, viz., very wet, or very dry, are usually limited, and the work cannot be overtaken with hand-brushes.

If gravel be used for steam-rolling, it must contain a fair proportion of broken stone, the

*By E. A. Hackett, County Surveyor, County Tipperary, S. R., Ireland.

more the better. The vibration of the traffic starts round gravel stones, and, following the easiest course, they come to the surface and make it like a cobble pavement. Use as little binding material as possible, and not until the stone is fairly well consolidated. Sand or fine gravel make the best binding, as it will not fly about in the wind and turn into mud, but old road scrapings may be used, and on country roads will do fairly well, but of course they produce mud or dust. Stones to pass through a 2½-in. ring is the happy medium as respects size.

The heavier rollers are the most economical to work, but for narrow streets you must have a roller which has a narrower roller path, 6 to 10 tons, say. Summer work is always the best. Roll until the stones present a smooth surface, but not until the divisions between them are obliterated, as if that be done the stone gets crushed. If necessary scarify road into proper shape before spreading stones, and coat with a layer that when complete gives 3 ins. in thickness. If necessary to put more than 3 ins. roll in two layers. Scarify road lightly in dry weather, or where rolled before. The supply and spreading of stones may be done by contract, but it is more successfully done by direct labor.

After all is said and done, success depends more than anything else on the personality of the county surveyor—his knowledge of the work and his capacity for administration, particularly his capacity for selecting subordinates. If a council is wise it will interfere as little as possible. I am glad to say I am in that happy position myself.

Steam Rolling in County Antrim.*

The method of applying and consolidating broken stones on the roads by steam rolling had been in operation on a small scale in County Antrim for several years previous to 1903, when, after seeing the results, the ratepayers generally began to recognize the benefits which they might expect to reap if a more extended system of steam rolling were adopted.

In the last quarter of the financial year 1903-4, proposals to raise sums varying from $243 to $2,430 in the following year for steam rolling were brought forward and approved of by all the Rural District Councils. A total of $14,700 was then allocated for steam rolling work.

As the number of rollers available on the hire system was limited and the tendered rates for rolling somewhat high, the County Council decided to purchase five steam rollers, so that they might be in a position to ascertain for themselves, on undisputable evidence, the relative merits of the "hire" and "purchase" systems.

A loan of $15,000 for the purchase of rollers was applied for and sanctioned by the Local Government Board, repayable within 10 years.

If the $15,000 to be raised by loan were made a county-at-large charge, the County Council considered it would not be right that the rural and urban districts should contribute in proportion to their respective valuations to the repayment of the loan, because (1) the rural districts would probably not use the rollers equally, and this method would make the expense bear hardest on those using them least; (2) it would probably be necessary to hire additional steam rollers, and the districts so hiring would have to pay the full price of the hired rollers, and also their proportion of the cost of the purchased rollers, which would manifestly be unfair; (3) the urban councils, who would receive no benefit under the scheme, might be obliged to contribute their proportion, and would thus have a serious grievance. For these reasons it was decided to fix a price per day for the use of the rollers, based not only on the actual working expenses, including repairs, etc., but on the annual payments in redemption of the loan, and to debit this price against each Rural Council for the actual number of hours the rollers might be used by it, the price was fixed at $1.08 per hour for roller and full gang based on the following rates:

	Per hour
Hire of roller plant, including fuel, stores, etc.	$0.54
Wages of driver	.12
Wages of flagman	.08
Wages of two sweepers	.12
Wages of carter and horse for water cart	.14
Wages of overseer	.10
Total	$1.08

A steam roller account was opened in the county books crediting it at above rates with the total number of hours actually worked by the rollers and debiting it with the working expenses, including repairs, insurance charges, and repayment of loan.

Two rollers, with outfits complete, including scarifiers, watering carts, and sleeping vans, were purchased in March, 1904, one roller 10 tons, and the other 12½ tons in weight. Two more rollers, with accessories, were purchased in March, 1905, one 12½ tons, and the other 15 tons. A fifth roller, 15 tons in weight, with outfit complete, was purchased in March, 1908.

A special assistant to the County Surveyor was appointed in 1904 by the County Council to supervise steam rolling work, etc.

The five rollers have been kept constantly at work since their arrival, except during frosty weather and when being overhauled or undergoing repairs; the actual tonnage of broken stones rolled in has averaged annually for the 10-ton roller, 9,000 tons; for the 12½-ton rollers, 10,500 tons, and for the 15-ton rollers, 12,000 tons, the stones being rolled in at the rate of about 3½ tons per hour with the 10-ton roller, 4½ tons per hour with 12½-ton rollers, and 5½ tons per hour with 15-ton rollers. The cost of rolling per ton, therefore, to the various districts using the rollers works out at 31 cts., 24 cts., and 20 cts. for the 10, 12½, and 15-ton rollers respectively, based on the chargeability of $1.08 per hour for the time worked by each roller; the actual cost per ton for rolling done up to date has been considerably less than the above—taking the first two rollers, which have now completed six years' work, the roller account stands as follows:

The total chargeability or earnings at $1.08 per hour for time worked by the two rollers in the various rural districts for the 6 years ended the 31st of March, was $31,200.

The actual cost of working the two rollers during this period, including wages, fuel and all stores, repairs and renewals, insurance charges and repayment of principal and interest on loan, was as follows:

Working expenses, including wages of men, coal, tools and minor repairs	$21,728.64
Insurance of workmen, third parties and boilers	267.14
General repairs and renewals	1,127.52
Repayment of principal and interest on loan	4,519.80
Total working expenses for 6 years	$27,643.38

which leaves a credit balance on the first six years' working of two rollers at the rate of about $292 per annum per roller.

The rollers at the end of five years were each overhauled thoroughly, one driving wheel on a 12½-ton roller had worn so thin that it required steel plating, the working parts of both rollers which required tightening up or repairing were forwarded to the makers, and at the same time a boilersmith was engaged, taking out boiler tubes, cleaning same, and replacing defective ones, while a fitter was engaged facing up slide valves and other repairs which could be carried out on the ground. The total cost of this overhauling of the two rollers was $1,001.52, including $92 for steel plating one driving wheel. The only other items of important expenditure were the renewal of main driving axle, which fractured on two occasions, and the renewal once of a crank shaft. In the former case the makers supplied the replace axles free of charge.

The rollers at the present time, after six years' wear, are in fair working order, but no doubt new driving wheels and other renewals will become necessary during the remaining four years of their assumed life. However, I venture to say that the market value of the rollers, at the end of this time, might balance the cost of their upkeep in the meantime.

The cost of steam rolling by contract previous to 1904 was $1.24 per hour for the hire of roller and accessories, with the full working gang previously referred to, or about 30 cts. per ton, but since the purchase of county plant, the contractors have reduced their tendered rates to 90 cts. per hour, or 24 cts. per ton, and during the last few years from ten to fifteen hired rollers have been engaged in addition to the five county rollers, as provision is now made by the District Councils for steam rolling 180,000 tons annually, or about 75 per cent of the total stone supplies.

As the chief object in steam rolling when surfacing roads with broken stones, is to obtain a solid, durable and smooth surface, it follows that the best materials available must be used, combined with the best workmanship, to insure the best results. The broken stone selected should be hard and tough, and at the same time durable under wear and tear and the other agencies to which it will be exposed. On roads subject to heavy traffic excellent results may be obtained if broken approximately cubical to a uniform gage of from 2¼ to 2½ ins. On roads subject to light traffic, stones broken to a smaller gage of from 1½ to 2 ins. gave a smoother wearing surface. In both cases, if uniformity of size is adhered to, the surface will wear uniformly, provided the road foundation be strong enough to resist the pressure applied by the traffic without crushing or permanent set. The stone used in County Antrim is principally basalt, varying in structure from columnar to amorphous, and the best selected qualities fulfill approximately the requirements mentioned. The next item of importance is the binding material used in rolling. The ideal binding material is one which will hold the stones firmly in position, and eliminate internal friction, so that the stone will wear on the exposed surface only until it becomes as thin as a coin. With ideal binding material it should also be possible to make the road surface practically impervious to water. The application of tar or a tar compound as a binding material, when used properly, seems to give the nearest approximation to these requirements, but the cost on a large scale is prohibitive. The material used for binding in County Antrim is old road detritus, freed from impurities, by a lengthened exposure to rain, frost and sunlight. This may be well effected by heaping the road scrapings when consolidated, against the face of road fence at intervals along roads which are to be rolled. This can be done so as not to look unsightly by building up the material about 6 ins. wide and as high if necessary as the bank of fence will admit. In the opinion of many road experts, with this class of binding material it is possible to obtain a better bond and more durable surface than with either fine stone screenings or loamy sand. Any binding material should be very sparingly used.

The practice of steam rolling as carried out in County Antrim under the supervision of the writer during the period under review, has been as follows: When a length of road has been selected for rolling, before materials are laid down, the road is thoroughly cleaned by scraping, etc., the margins trimmed to give if possible a uniform width for the working surface, which is to be steam rolled, including in most cases the two side channels. When ready for rolling operations, the surface is scarified if worn unevenly, provided the crust is considered strong enough. The stone coatings usually applied vary in depth from 2½ to 6 ins., according to the strength of existing crust and the class of traffic to which it is subject. The greater part of the stones are run out from the recesses or sidings adjacent on wheelbarrows, but occasionally the supply for spreading has to be supplemented by horse work where the distance of recesses from point of spreading exceeds a barrow run. Two of the most skillful men are selected for spreading, as in the art of good spreading the result of the rolling in a great measure depends, especially in the case of unscreened hand broken stones, which contain a considerable amount of fine material. When filled into barrows or carts, the fine material

*By J. F. Beatty, A. M. Inst. C. E., Assistant Surveyor, County Antrim, Ireland

shakes to the bottom, and when the load is tipped up on the road, the fine material remains separate from the coars. A good spreader applies the stones so that the fine material is scattered over the coarse, while a careless spreader may cover one square foot with coarse stones and the next with fine ones, or perhaps leave all the fine ones where they were dumped, and simply level them by pushing over the top stones with the back of the shovel point. A skillful spreader draws back the shovel deftly from under the stones, causing them to spread and drop in the required position. An unskillful spreader tilts the shovel over and allows them to slide off without spreading them, and to this practice may be attributed in many cases the uneven wear of a steam rolled coating.

After stones are spread to the desired cross section on a short length and to as great a width as possible, after allowing a clear space for the passing traffic, the roller can proceed to follow up the spreaders, commencing at side of road with one driving wheel and gradually working up to the center of road, shifting only a few inches each time the roller returns. The number of times that the roller has to be passed over depends on the weight of the roller, the nature of the foundation and materials, and also on the thickness of the coat to be rolled. If the road on which the stones are spread is dry and hard, watering has to be resorted to at the commencement. With machine broken stones screened to a uniform gage, after the first rolling, sufficient half inch tone chippings are applied to fill up the interstices, and the cross sweeping, watering, and rolling is then proceeded with until the road presents a mosaic like surface, with the stones well wedged together and the flat sides up. When loose stones are crushed by the roller instead of being forced into the road, binding material well mixed to the consistency of thick cream is applied in small quantities sufficient to fill the voids, and the necessary consolidation will be attained when the creeping motion of the stones ceases, as they will then have been forced into contact and interlocked. Any surplus binding is then swept off the surface and the rolling is completed.

Last season several experimental lengths of rolling were done, using tar as binding material, and the best results were obtained in dry weather by first cleaning the road thoroughly, and tar spraying the surface before applying the ¾-in. in stones was then applied on the top of this layer, and after depth of tarred stone chippings, the coating of 2½-in. broken being thoroughly sprayed, almost at once settled into position without creeping appreciably under the weight of the 15-ton roller used. Stone chips were then applied and worked into the interstices by cross sweeping and rolling. After this the surface was again sprayed and covered with very fine stone screenings free from dust, and the traffic turned on.

The Management and Care of Steam Road Rollers.*

Owners of steam road rollers cannot give, in the writer's opinion, too much attention to the management and care of their road rollers, and the author therefore thinks it advisable to give a few suggestions on this subject.

First of all, a steady and reliable man should be secured to take charge, as a good driver will add years to the "life" of a steam road roller and save the owner considerable expense in repairs.

The boiler should be insured with a good company, as they will have it inspected periodically by their own inspector. These inspections will cause little inconvenience. They can be made when the boiler is being washed out, which should be done every 14 days, or even more frequently, if dirty feed water has been used.

The Boiler.—Insist upon having clean water used to feed the boiler. Unclean water is liable to injure the boiler plates, cylinder, slide valve, starting valve, and any other surface over which the steam from dirty water passes.

If a leak is noticed from the boiler have it stopped immediately; this is very important.

Special attention should be given to washing out the boiler, which should be done when the boiler is cold.

If a pressure of water cannot be obtained for this purpose use a force pump to remove all sediment which will accumulate in the boiler. All mud-hole covers, or plugs, and the man-hole cover should be removed before washing out is commenced, and the inside of the boiler carefully inspected before they are replaced.

Scale should not be allowed in the boiler. As a preventive, pure caustic soda used judiciously has been found to be most effective. The proper amount is, for very hard water, 1 oz. to every 5 gals. of water, and for water of medium hardness, 1 oz. for every 10 gals., and for fairly good water, 1 oz. for every 15 gals. In using caustic soda the blow off cock should be opened every night after work, when pressure is in the boiler, until the water in the gage glass has been reduced by about ½ an inch.

The tubes should be drawn and cleaned every three years and carefully examined. If there are any tubes badly grooved or pitted they should be replaced with new ones.

Leaking tubes should be tightened with a suitable expander, the rollers of which should not be allowed to go beyond the tube plate.

The rollers should be driven on rising ground so as to keep the crown of the fire-box well covered with water. In case the boiler through accident or neglect becomes short of water, the fire should be drawn, until the proper amount of water has been put in the boiler.

If at any time the fire has to be drawn, a cover should be placed on the top of the funnel to prevent cold air passing through the tubes. The ashpan lid should also be closed. If cold air is allowed to pass through the tubes they may leak, owing to the sudden contraction. It is also injurious to the fire-box.

The inside of the fire-box should be frequently scraped and brushed with a wire brush, especially the seams and screwed stay heads, also the smoke-box tube plate and smoke-box.

If the roller is to be laid aside for any length of time, it is advisable to grease the plates of the fire-box and smoke-box after cleaning.

Grease or oil should not be allowed inside the boiler.

The fusible plug should be examined frequently and kept free from dirt, and the fusible metal renewed at least every six months, or whenever it shows signs of leakage.

The lagging on the barrel of the boiler should be removed every three years, the plates well cleaned and painted with red-lead paint, composed of 88 per cent of red lead and 12 per cent of raw linseed oil. This is the most efficient of all paints in protecting iron from rust.

It is necessary to examine the water gage fittings every day and to keep the passages free from sediment. The feed water fittings on the boiler should be examined and cleaned when the boiler is washed out.

The Tender.—The water tank of the tender requires cleaning out frequently, as dirt will accumulate in it from various causes, which if not removed will pass into the boiler. It is important to keep the bolts which hold the axle boxes, tender, and horn-plates together, perfectly tight.

Feed Pump.—If the feed pump refuses to act, this is usually due to bad vacuum, caused by an imperfectly packed gland, or a badly-made joint of the suction pipe, or perhaps leaking check valves from the boiler. These points should therefore be carefully examined. A pet cock is usually fitted, which if used properly will in most cases allow any air or steam in the barrel of the pump to escape. The passage into the boiler must be kept free from any obstruction.

The Injector.—If the injector fails to act, it may be due to hot water, or dirt in the tank. Small pieces of wood or waste will often give considerable trouble if allowed inside the body of an injector. It is therefore well to take the injector to pieces if trouble is experienced.

Steam Pressure Gage.—It is very important to have the steam gage in thorough working order. It is wise to have it tested from time to time. A steam roller should not be worked without one in perfect order.

Getting Up Steam.—The fire must not be lighted until the specified amount of water is clearly shown in the water gage glass. The necessary pressure of steam should be obtained gradually; it is injurious to the boiler to raise steam too quickly.

Safety Valves, which are usually fitted on the top of the cylinder casting, must be kept in thorough working order and allowed to blow off at least twice a day when at work.

Cylinder.—The joint between the cylinder foot and the boiler should be kept perfectly tight; if an escape of steam is noticed, it is always better to re-make the joint.

The piston should be drawn from time to time, the rings examined and tried in the cylinder to ascertain if they are a perfect fit, which is essential to make the piston when at work steam tight.

The slide valve should be kept steam tight, and accurately adjusted to insure the engine working economically.

The starting valve, which allows steam to enter the steam chest from the boiler, should be absolutely steam tight, and properly adjusted; this is most important; if any steam passes this valve, when it is assumed the steam is shut off, the engine is liable to start and might cause some serious accident.

It is necessary to keep the exhaust passage and pipe free from obstruction. They should be examined at least once every three months. Oil and dirt frequently accumulate here, causing considerable back pressure and loss of power.

Glands.—Special care is required, when packing a gland, to make it steam tight and to give the least possible resistance.

Packing should be obtained of the correct size for each stuffing-box. The piece of packing nearest the steam pressure should be renewed frequently. This piece will collect a considerable amount of grit, which will damage the rod if allowed to remain too long in the stuffing-box. When screwing up the gland the stud nuts should be given the same pressure so as to keep the gland parallel with the rod.

Link Motion and reversing gear must be kept in thorough working order to obtain good results and economical working of the engine. If play is allowed in any of the joints the power of the engine will be greatly reduced, and any defect should therefore be repaired at once.

Bearings should be properly adjusted from time to time; knocking should not be allowed in any bearing. Studs which hold caps of bearings should be frequently examined to ascertain if they are properly secured in the brackets; the threads of the studs and nuts also require careful inspection. Threads of studs are often fractured when a bad knock is allowed in a bearing.

Lubrication.—It is advisable to use the best quality of oil for lubricating the moving parts of a steam roller; and although the cost of such lubricants may be high, they will be found the cheapest in the end.

Syphons made of fine brass wire and worsted should be fitted in all oil cups; the worsted should rest on the bottom of the oil cup and pass down the pipe with the wire, to below the bottom of the oil cup. The oil cup of the connecting rod big end should have the worsted projecting only half an inch out of the oil pipe, as the oil will be thrown over the pipe every revolution of the crank shaft. Have the worsted renewed frequently.

Traveling.—When traveling from one part of a country to another, a steam roller should not be driven at a greater speed than at the rate of three miles per hour. If the driving rollers slip on a frosty road, stone sets, or a steep hill, a little sand, ashes or small pieces of wood will generally, if thrown under the driving wheels, get over the trouble.

If the ground is soft and the roller sinks, it

*By Wynnd Eddison.

is far better to have it lifted up with a screw-jack, and timber placed under the wheels, than to allow it to force itself out.

When passing through towns and villages the roller should be driven slowly and no steam allowed to escape. The ashpan lid should be closed when passing thatched buildings, stacks, or other combustible material.

When the roller is stopped to take in water, or for other reasons, the driver should examine all bearings and see that all nuts and set screws are perfectly tight, and that no split keys are missing.

Laying Up.—If it is necessary to lay up a roller for any length of time, the back cover of the cylinder should be removed, and the inside of the cylinder well greased; the steam-chest cover and the stop-valve cover should also be removed, and the faces well greased to prevent corrosion. At all times the roller is better in a dry shed. In the summer months the water may be left in the boiler, if the boiler is filled up to the filling hole, but the water should be renewed every two months. In the winter months it is better to drain all the water out of the boiler and pipes.

The following is a summary of Acts of Parliament which relate to road rollers:

First: When traveling the flagman shall precede the roller on foot by not less than 60 yds., and shall carry a red flag constantly displayed, and shall warn the riders and drivers of horses of the approach of such locomotive, and shall signal the driver thereof when it shall be necessary to stop, and shall assist horses and carriages drawn by horses passing the same.

Second: The driver of a road roller shall give as much space as possible for the passing of other traffic.

Third: The whistle of a roller shall not be sounded for any purpose whatever, nor shall the cylinder taps be opened within sight of any person riding, driving, leading or in charge of a horse upon a road; nor shall the steam be allowed to attain a pressure such as to exceed the limit fixed by the safety valves, so that no steam shall blow off when the locomotive is upon a road.

Fourth: The roller shall be instantly stopped on the person preceding the same, or any other person with a horse, or with a carriage drawn by a horse, putting up his hand as a signal to require such locomotive to be stopped.

Fifth: A road roller must carry two efficient lights to be fixed conspicuously—one at each side on the front of same—between the hours of one hour after sunset and one hour before sunrise.

A long span masonry arch has recently been completed on the Bellegarde-Chizery Ry. in France. The main arch is 262 ft. 9½ ins. long and springs from one side to the other of a rocky gorge 215 ft. deep at the elevation of the structure. The arch is 4 ft. 11 ins. thick at the crown and 8 ft. 2 ins. at the springing lines. The main arch carries eleven spandrel arches supporting the roadway. In order to construct this arch three timber towers 133 ft. high were first erected and then a system of braced centering was built out from them, the whole calling for nearly 264,000 ft. B. M. of timber and about 30 tons of steel. The total cost of this structure is given as only about $90,000.

The Nevada Copper Belt R. R. Co. has moved its headquarters to Mason, Nev. Work on the extension at Wabuska to the smelter site of the Mason Valley Co. is well along.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Method of Constructing Submerged Pipe Line Under the Kaministiqua River, Fort William Ontario Water Supply.*

The river at the point of crossing is 330 ft. in width and only one sounding revealed a greater depth than 25 ft. At this time the draft of boats operating beyond the proposed crossing to the coal docks of the Canadian Northern Ry. did not exceed 17 ft., but before the work was completed the erection of a grain elevator and the establishment of a rail dock by the Grand Trunk Pacific Ry. developed a large traffic by ships drawing as much as 21 ft. of water. This traffic was still further increased by tugs hauling scows to the dumping ground in the lake from the dredges working on the upper reaches of the river. The river has frequently a considerable current, and usually carries a quantity of alluvial matter in suspension. The water is naturally of a dark brown color, owing to its passage through the muskegs and swamps that abound at the head waters of the river. As a result fifty candle power lights can only be seen through it as a beacon at a short distance, and are of no value as an illuminant.

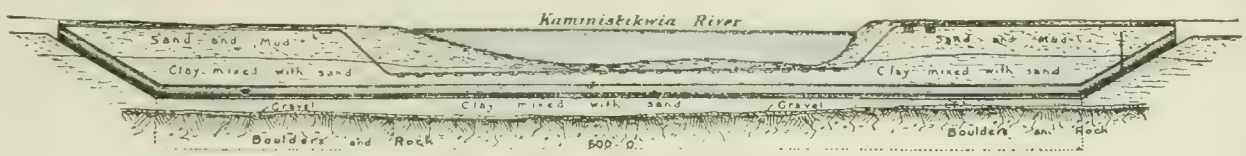

Fig. 1—Submerged Pipe Line and Proposed Tunnel.

The bed of the river is covered by several feet of alluvial deposit and sand, overlying a bed of blue-gray clay, itself containing a small percentage of fine sand. Solid rock of uncertain character is found at a depth of from 55 ft. to 58 ft. below water level. Overlying the rock is a bed of from 2 to 5 ft. in thickness of gravel and small boulders, bearing water under a head that rises in the boring tubes some 4 or 5 ft. above the surface of the river.

The question of a tunnel through the clay bed under the river was seriously considered, but it was decided that pipe lines would be sufficient for many years, and that this expenditure could be deferred until the growth of the city enabled it to bear the cost with less difficulty. Owing largely to an incomplete knowledge of the nature of the material to be encountered, this cost was originally thought to be much greater than will actually be necessary. It was also anticipated that pipe lines could be laid in a much shorter time, and the much needed temporary water supply more quickly obtained.

It was the writer's original intention, when the pipe line had been decided on, to dredge two channels and lay a duplicate main of hub and spigot pipe, with a flexible joint at every fourth joint, as sufficient until such time as a tunnel became necessary. The majority of the board of commissioners objected to the flexible joints and also to the ordinary lead joint for use under water. They wanted every joint under water to be a flanged joint, and were quite willing to bear any additional expense incurred by this method of construction.

The material for this work was ordered by the city from the D. Y. Stewart Co. of Glasgow some weeks prior to the award of the contract.

A special Y-connection was made with the pressure main on the south bank of the river, and two lines of hub and spigot pipe carried at a diverging angle of 45° with the center line until the ends were 100 ft. apart; 45° bends then carried the two pipe lines parallel 100 ft. c. to c. to the bank of the river, where they dipped by a one-eighth bend at an angle of 45° to a grade line 28 ft. below the normal water level of the river. This grade was matained for 300 ft. on both lines, at which point 45° bends were used to bring them to the surface, where a duplication of the arrangement on the south bank connected them at a second Y with the 18-in. main leading to the city. Every joint under water was a flanged joint. The flanged pipes were 12 ft. long, of standard specifications, ⅞ in. thick, and weighing not less than 2,000 lbs. per length. The flanges were ⅞x3 ins., supported by ribs, and provided with 12 ¾-in. bolts on a bolt circle of 22¾ ins. diameter. Corrugated copper gaskets were used for all flanged joints, after the turned faces had been thoroughly cleaned and lightly smeared with "manganesite" paste. Concrete cut-off walls were built around the pipes lying on both sides of every bend, as a support for the vertical bends and to resist the thrust tending to move the horizontal bends. Two 18-in. valves with spur gearing were placed close to the south Y and two laid flat with bevel gearing close to the north Y.

For the purpose of protecting the pipe at the water line from frost and from the danger of contact with boats two 50-ft. piles were driven 6 ft. c. to c., 18 ft. from the points where the pipes emerged from the river, 6 ft. nearer the shore, and 12 ft. c. to c., two more piles were driven, and two additional piles, 18 ft. c. to c., were driven close to the shore line. All these piles were securely tied together and into the bank with 8x12-in. walings and 12x12-in. internal cross bracing. Any tendency to slide into the river was overcome by attaching the whole structure to four ¾-in. wire ropes anchored to dead men 50 ft. from the river bank. A second line of waling was sunk on the inside of the piles at a depth of 6 ft.; 3x10-in. sheet piling was then driven on the inside of the walings around the frame thus formed, and the inclosed space backfilled to an elevation 3 ft. above the top of the pipe.

The specifications allowed the contractor considerable latitude as to the method to be adopted in laying this pipe. The essentials were that it be laid to grade on a solid bed: that it should bear a test pressure of 200 lbs. per sq. in.; that the contractor should bear all loss from breakage or damage, until the final acceptance of the work, and the method of laying adopted was to be entirely at his own risk. He was also to provide all necessary appliances for laying the pipe, drive all necessary piling and furnish a satisfactory and permanent support for the pipe.

This somewhat indefinite clause was almost forced on the writer by the very short time available for the production of the specifications and lack of time and opportunity to test some of the unknown factors in the problem.

Deferred delivery of the pipe delayed the commencement of this section until late in

*Extract from a paper by H. Sydney Hancock, Jr., presented to the Canadian Society of Civil Engineers

the summer. A sub-contract was let to the Great Lakes Dredging Co. of Port Arthur, the only company in the district at that time possessing the necessary dredges, scows, and diving outfit, and it placed an experienced diver foreman in charge of the work. The original soundings indicated that the solid clay foundation would be secured at the required depth. Two trenches 15 ft. in width were dredged across the river to a depth of 28 ft. below water level. The bottom of the trench was carefully prepared by a diver, assisted by careful measurements, and a firm level clay bed reported. Four lengths of pipe were then bolted together on the bank and lowered into a position by a hoist operating over the leads of a scow pile driver. Thus every fourth joint was made by a diver under water. Before the first pipe line was completed the writer contracted typhoid fever and tests were deferred until his recovery. Some of the bends had failed to arrive before winter set in, for which the contractor was not responsible, and it was necessary to extend the time of completion to the spring. The west pipe line had, however, been laid across and the most elementary tests proved it to be defective. The sub-contractors objected to doing any work during the winter, claiming, with justice, that the city had failed to supply pipe within the time contemplated by the contract. They finally, however, got their diver working, and just before the ice broke up, got east pipe line, three lengths at a time, care being taken that the joints that had been made under water should not be disturbed until they had been examined on the bank. This bank inspection revealed the fact that the previous diver, in his efforts to stop the leaks, had driven wood wedges between the flanges, forcing the copper gasket into the center of the pipe.

There being no effective hydraulic dredge on Thunder Bay and the dipper dredges in service only working to a depth of 29 ft., it was impracticable to lower the grade line for the purpose of securing a firm bed, and it was decided to support the pipe throughout its length. The obvious solution was to drive a double row of piles and support the pipe on the caps joining the two rows. Suitable materials and equipment for this form of construction were, however, not available, and the following was adopted in lieu of it:

Concrete blocks, 1x3x5 ft., were cast on the bank, reinforced with four bars of ½-in. round steel each way. Two ¾-in. inverted U-pieces of iron, with the points of the U hooked around the reinforcement, were placed in each block, so that when set two loops were exposed at either end of the block for the reception of the hooks of the hoisting chain. These blocks were laid at 12-ft. centers, supporting the center of each pipe. Often large quantities of silt had to be removed from the trench in order to reach clay. An 8-in. centrifugal pump was first used, with little success. Finally, two No. 4 Edson diaphragm pumps, attached to two lengths of hose, were found to work admirably.

Further assistance was furnished by a 2-in. hose with ¾-in. nozzle, supplied with water from the reservoir at 125 lbs. pressure. The diver directed the ends of the hoses and nozzle. When solid clay was reached and a bed leveled by excavation, a block was lowered and leveled by means of a 20-lb. plumb bob. If the final elevation of the block was more than 1 ft. below grade, a second block, 4 ft. in length, was laid on the first, leaving a 6-in. step. In three cases, three blocks were necessary to raise from solid clay to within 12 ins. of the grade line. The elevation of the top block was then carefully measured, and a piece of flat, slaty rock of the necessary thickness was laid on the block to act as a temporary support for the pipe. A single pipe was then sent down and bolted up. A rich concrete of fine gravel was lowered in long sacks and worked between the pipe and the top of the block. The ends of the sack were padded up, so that when the concrete had set the pipe was supported by a cradle formed to the shape of the pipe. A blind gasket of ⅜-in. boiler plate was bolted to the open end of the pipe, and the whole line up to that point tested. A small hand force pump was the only pump available, and it refused to do better than 120 lbs. per sq. in. Ninety pounds was, however, easily secured after the pipe became full, the pump leaking badly above that pressure. If there was any fluctuation in the time required to raise the pressure, the last joint laid was carefully gone over until the best test was secured within the capacity of the pump, this capacity being checked on four lengths bolted together on the bank. Every joint was in this way tested under water. When the line was completed, a ¼-in. pipe from the pressure main was led through a blind gasket at the shore end of the river pipe. With the cock slightly turned, the river pipe held the same pressure, during a 24-hour test, as the pressure main on the shore side of the gate valve at the same elevation, or approximately a pressure of 125 lbs.

As concrete blocks were not considered in the original contract, an extra was allowed the contractor for this portion of the work. The personnel of the gang was as follows:

Foreman, at $8.00 per day	$ 8.00
Diver, at $10.00 per day	10.00
2 Helpers, at $3.50 per day	7.00
Hoistman, at $4.00 per day	4.00
6 Laborers, at $2.50 per day	15.00
1 Diving Suit, at $10.00 per day	10.00
1 Scow and Hoist, at $15.00 per day	15.00
Total per day of 10 hours	$69.00

A record was kept of the time spent in excavating for and placing the blocks, and resulted in the city paying the contractors $747 in addition to supplying the blocks. Thirty-five blocks were laid on this line under the horizontal 300 ft. of pipe on the river bottom, and as each block cost $4, the charges for material and labor amounted to $887, or $2.95 per foot.

The large river traffic greatly increased the cost of the work. The pipe lines were located at a bend in the river where light boats in a wind were swung over a wide range, and during the work in the middle of the river the passage of every boat meant a cessation of operation and the hauling of the scow well toward the shore line. This feature alone probably doubled the time spent on the work.

Fig. 2—Details of Submerged Pipe Line and Tunnel.

the line in such shape that the loss could be approximately measured as not less than 2,000 gals. per minute at a pressure of 125 lbs. Immediately after the ice had left the river they made further attempts to improve the line by tightening the joints. The failure of their force pump and the impossibility of procuring another, led, pending its repair, to the use of the pressure from the reservoir for temporary testing. One of the joints on the banks invariably blew out under this treatment, and some weeks were consumed in fitting a sleeve on this joint. When this had been fixed, gages on opposite sides of the river showed a pressure loss in the crossing of 3 lbs. and it was quite obvious that the joints under water were so badly made that the whole pipe line must be moved to effect a closure. The contractors were therefore notified that the pipe line must be taken up and relaid. They then took the position that the material supplied by the city was defective and that a tight joint could not be made with copper gaskets. This latter statement was easily refuted by an object lesson on the bank. The sub-contractors were in a rather strong position, as they owned the only available equipment within a large radius. However, after several weeks of acrimonious negotiation it was arranged that the chief contractors were to take over the work from the sub-contractors and that the latter would supply the necessary equipment at an agreed price per day. The chief contractors then arranged for the writer to directly handle the work, they to pay all costs.

Examination by an independent diver revealed the fact that, contrary to the report of the sub-contractors' diver, a clay bed had not been secured, and that there were holes filled with unsatisfactory material in the trench, varying from 1 to 3 ft. below grade, and in some cases extending over three or four pipe lengths. There was a slight deflection either up or down at each joint made under water, and some bolts were missing and others very loose. Work was commenced by raising the

The summer was drawing to a close when the first line was completed and put in operation. It was therefore deemed advisable to defer the relaying of the second line until the river was frozen over. Work could then be conducted from the ice and the delays due to navigation avoided, these advantages promising to more than offset the difficulty of working in very cold weather.

Prior to recommencing the remaining portion, however, a settlement was effected between the contractors and the city, by which the latter took over the work for an allowance of $2,500, its estimated cost, exclusive of blocks. When about half completed in January, 1908, the Dominion government announced its intention of dredging the river to a depth of 25 ft. and a width of 500 ft., in the course of a five-year programme. In view of this, the advisability of abandoning the pipe line and driving a tunnel was seriously considered. However, the low position of municipal bonds in the market at that time indicated that it would be sound finance to complete the pipe line and drive the tunnel at some future time within the five-year limit set for government operations, when the financial conditions would probably be more favorable. The second line was then completed at a total cost, including blocks, of $3,180. A slide at the north bank and an unexpected accumulation of sunken logs caused much trouble, but the cost only slightly exceeded expectations.

It is probable that a tunnel will be driven next year. While the main reason for this step is the contemplated widening of the harbor, it has become more necessary because of the rapid approach to a population of 30,000, foreshadowing the necessity of additional pipes, and to the fact that all large boats, in making this bend in the river, drag anchors if there is any wind, thus placing the pipes and cables (light and telephone) in constant danger.

Injury to the power cable seriously crippled

the work on the Loch Lomond tunnel, and in November last a boat dragging a large fluke anchor picked two lengths of pipe from one of the lines and carried them up the river. Both pipes were broken close to a flange, the remainder of the line remaining intact. The pipes carried away were Nos. 5 and 6 from the south bank. The flanges between pipes 4 and 5 were left, but the flanges between pipes 6 and 7 were carried away. Pipe 5 was replaced by an ordinary flanged pipe, and pipe 6 by one with a flange at its junction with No. 5 and spigot end to join 7. The joint between 6 and 7 was then made by a special sleeve, 24 ins. long, grooved and leaded and caulked under water with shredded lead. The pipe line is apparently as good as ever, having been in continuous operation since its repair.

The tunnel is to be 8 ft. internal diameter, lined with three rows of brick. Three concrete benches, 2 ft. wide, will support each 12-ft. length of the first double line, either 18 or 24 in. pipe. A second double line can be laid above the first when necessary on a steel staging. Conduits for cables will be placed in the benches, and additional racks provided above the pipe. The Kaministiquia Power Co. expects to carry its cables in the same tunnel in order to furnish power to the Grand Trunk Pacific Ry. terminals and elevators.

As a protection against accident, large notice boards were erected on both sides of the river warning navigators not to drag chains or anchors. Similar boards warning navigators of the presence of the pipe were placed 400 yds. up and down stream from the crossing. All boards are illuminated at night by red and white lights.

The cost to the city of the river crossing was as follows:

City Expenditure on River Crossing:

On pipe for river crossing	$ 5,317.00
Valves for river crossing	628.00
Gaskets for river crossing	134.00
Labor on second line pipe	2,676.00
Labor on second line—blocks	892.00
Cost of blocks, extra pipe, etc.	584.00
Pile driving and bank protection	415.43
Total	$10,640.43

The New Sewerage System of Louisville, Ky.—General Description of the System.

The city of Louisville, Ky., is constructing a $4,000,000 sewer system. This work, begun two years ago, will be finished two years hence, and will, when completed, provide one of the most complete sewer systems in the country, and from a standpoint of workmanship, one of the very best.

History.—Before outlining the sewer system itself, it will be necessary to take up a little of the history of Louisville which leads to the present work. Early sewer constructions in this city consisted in building storm drains, in what is now the business section. The primary object of these was the relief of the streets and adjacent property during heavy rains. As the city grew and a water system was introduced, these drains began to be used by the people as sewers. They were extended from time to time until 1870, when Gen. I. M. St. John, then City Engineer, made a careful study of the immediate and future needs of the city and recommended the building of a number of large trunk sewers. Several of these were begun by General St. John, and his successors in office have recommended and built others, both large and small, as the necessary funds were available.

The insufficiency of this sewer system, to serve the various parts of the city as well as the inadequacy of certain sewers to drain the districts for which they were built, was early recognized, but funds were not provided in sufficient amounts to keep up with the growth of the city, to say nothing of supplementing the system where found too small. Since 1890, very little sewer work had been done at all and in 1906 the old system consisted of about 113 miles of sewers. In many districts the system was outgrown; rains caused the flooding of many localities and sewage running in the gutters was a common sight.

After several propositions for issuing bonds were defeated in the elections of 1902 and 1904, the legislature of Kentucky, early in 1906, passed an enabling act, creating the Commissioners of Sewerage and authorizing, subject to ratification by popular vote, the issuing of bonds amounting to $4,000,000. This commission was immediately appointed and began work at once by appointing a Board of Engineers. This board prepared a report which was submitted to the General Council and which outlined several schemes, one of which was approved by the council and was ratified by popular vote in November, 1906.

The first topographical map of the city for the study of the Board of Engineers was prepared under the supervision of the Geographer of the United States Geological Survey, and through an arrangement by which the topographers were furloughed from this organization and employed by the Commissioners of Sewerage. About this time Mr. Samuel M. Gray, of Providence, R. I., and Mr. Harrison P. Eddy, of Worcester, Mass., were selected as consulting engineers. These men, with the Chief Engineer, Mr. J. B. F. Breed, constituted the Board of Engineers and the new sewer system for Louisville has been designed and is being constructed entirely under the supervision of this Board. The engineering force has been gradually increased from the beginning and the complete organization is shown by the accompanying diagram, Fig. 1.

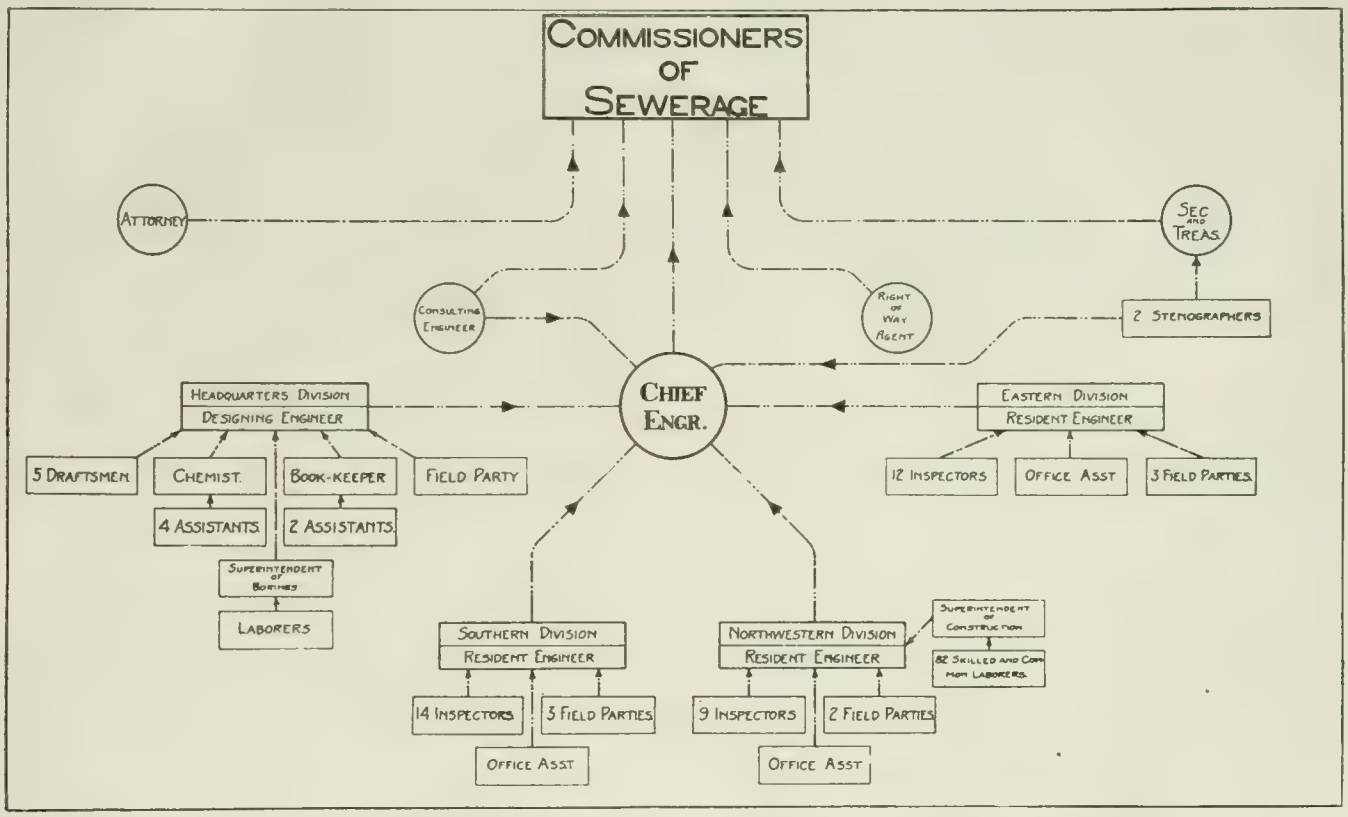

Fig. 1—Diagram Showing Organization of Engineering Department, Louisville Sewer Commission.

Topography.—The Ohio River flows past the city forming its north and west boundary lines. The river runs over a ledge of rock at Louisville, upon which it forms a series of rapids or low falls, the total fall of 28 ft., taking place in a distance of about 5 miles. When the river is high, however, this fall is not 28 ft., but is sometimes less than 1 ft. Thus below the falls the fluctuation is much greater than above them. A movable dam, built by the Government at the head of the falls, keeps the river at a depth of 9 ft. above that point. A large portion of the city is built upon a very level plateau which extends from Beargrass Creek west to the river. This plain is covered by a shallow layer of soft alluvial clay, below which is found a coarse sand, and in some places, considerable gravel. This gravel deposit is a reservoir for water which has been drawn upon for domestic and industrial supplies since the earliest days. Throughout the city are many wells on street corners, which were formerly the only means of supplying water for the city. The natural

outlet for this ground water is through the high banks of the river below the falls. Here are found large springs which run at all times during the season of low water in the river, but which are submerged when the river is high. Thus the ground water level rises while the river is in flood and falls during the low water season. This is especially true near the river bank. A peculiarity in the city topography is shown in the way in which most of the creeks find their way to the river. They all parallel the river for a considerable distance before finding a way to join it. This peculiarity was originally true in all cases, but has been changed in the case of Beargrass Creek which is now diverted by an artificial embankment and flows straight-away to the Ohio.

That part of the city east of Beargrass Creek differs widely in topography from the western portion of the city. From Beargrass Creek the land rises rapidly and is cut by several valleys having steep slopes. The soil is mostly clay, beneath which is a very irregular limestone ledge.

Improvement of Beargrass Creek.—A question in connection with the work of building sewers in Louisville, which has also been taken up and reported upon by the Commissioners, deals with the improvement of Beargrass Creek: This stream, which has three branches, drains an area of about 65 square miles and has for years been used as an open sewer. It is crossed by many bridges which obstruct the flow in times of high water. The districts near its banks have been inundated from time to time and enormous damage has been done. At times families were compelled to vacate their homes, and have even been taken from them at night by the Fire Department on account of a rapid rise in the stream.

The main line of the Louisville & Nashville Railroad which parallels the creek for about a mile, has been submerged so that trains were required to move very slowly, and at times, traffic has been entirely suspended. Manufacturers along the creek have suffered inconvenience and loss at intervals of increasing frequency. The bed of the South Fork of the creek is in places so high that several of the existing sewers do not have a free outlet even at times of low water, and at times of small freshets they are entirely submerged. This is a condition which is remedied by the Beargrass Intercepter, described later.

Since the time the city first built sewers discharging into the creek, the sewage has increased to such proportions that the stream has become a source of filth and very offensive and dangerous to the health of people living near it. The South Fork has been more troublesome by far, than either of the others because of its overflow, because it receives more sewage than the others, and because it has been the most subjected to encroachment by the erection of embankment and buildings, by the construction of a concrete channel 300 ft. long. The general scheme for the improvement will provide adequately for all flood waters in the creek. The Ohio River floods, however, will probably continue to cause overflows for short periods, but this is a condition which cannot be provided for at a reasonable expense.

Plan of Sewers.—The sewers outlined in the present plans, Fig. 1, constitute a comprehensive system. The old sewers will be intercepted, except in one or two minor cases, and provision made for taking care of the entire city and the outlying districts. It is intended to complete the main sewers first and devote the balance of the $4,000,000 to building the lateral sewers. This plan has been followed quite closely and at the present time most of the trunk sewers are completed or are nearing completion and many laterals are under construction. The main trunk sewers in the western part of the city are the Southern Outfall, the Northwestern Intercepter, and the Western Intercepter.

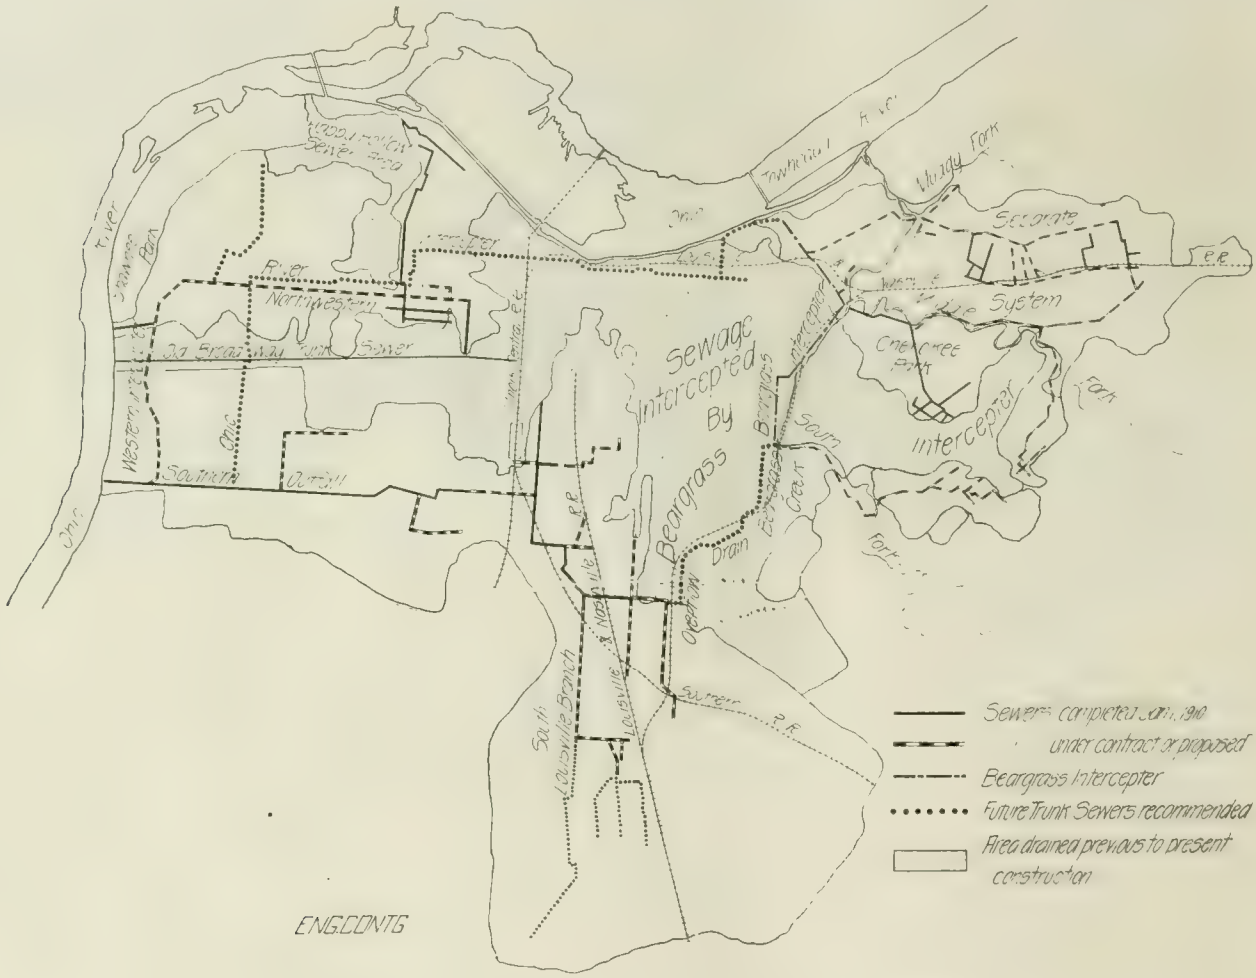

Fig. 2—Map Showing Plan of New Sewer System for Louisville, Ky.

The Southern Outfall is the largest trunk sewer in the city. It is about 5 miles long and is horseshoe shaped in its largest section being 15 ft. 6 ins. in horizontal diameters and 15 ft. 2 ins. in height. It will drain, when first put to use, about 7,000 acres, most of which is now improved land.

The crown of the sewer at its outlet is 378 ft. above sea level datum and, after the 9-ft. stage is established in the river below the falls, it will be below the surface of the water at all times. The 9-ft. stage will be at an elevation of about 383. The banks of the river here are high and the last section of the sewer is on a very steep grade, and of reduced section. This part is founded on concrete piles carried to solid rock. The extreme end of the outlet structure is founded on solid concrete carried down and into the bed rock for a depth of 4 ft. This was done on account of the tendency of the river banks after heavy rains, to move toward the channel. In the center of the invert on this outlet structure,

there is a channel 3 ft. wide and 2 ft. 10 ins. deep, the bottom of which is lined with a half section of vitrified sewer pipe. This channel is used for the dry weather flow, which will have a very high velocity—the grade here being about 37 per cent. The vitrified pipe was used rather than brick because of the absence of longitudinal joints at which sewer inverts on steep grades usually show the greatest amount of erosion, and for the great wearing qualities of the pipe. Above the outlet structure and drop chamber, the grade is flattened to 1 in 2,000 for almost the entire length. The sections of the sewer are reduced at different intervals and at the upper end the diameter is 7 ft.

The South Louisville Branch Sewer is designed to drain about 2,000 acres in the southern suburbs of Louisville, and empties into the Southern Outfall and has a diameter of 10 ft. at the junction point. The section of the city which this sewer drains will eventually be developed and improved to such an extent that the run-off from storms and the amount of sewage will be large at times as to tax the capacity of the Southern Outfall. For providing relief the Overflow Drain to Beargrass Creek was designed. In this way, it is intended that in times of severe storms the overflow from nearly 2,000 acres of one of the upper watersheds of the Southern Outfall, will be diverted to the Beargrass Intercepting Sewer, to be described later. In times of dry weather and also of moderate storms, the weir arrangement at the junction of the Southern Outfall and the Overflow Drain, will cause the flow to the Ohio River to be by way of the Southern Outfall.

The Northwestern Trunk Sewer has its outlet in the Ohio River at Shawnee Park. It is so designed, however, that the dry weather flow will not empty into the river at the park, but will be carried to the Southern Outfall sewer by an intercepter. The topography and other conditions at the outlet of the Northwestern Trunk Sewer are very similar to those at the outlet of the Southern Outfall and the design is, therefore, quite similar, except that as this sewer will discharge only storm water, the outlet has not been placed so low and no special dry weather flow channel has been provided. This sewer is designed to be high enough to discharge into the Western Intercepter and also, that it may pass under the intersecting streets at a suitable depth, it was necessary to make its height come within a 9-ft. limit. The sections are therefore wide where the largest areas are required. The largest section is 13 ft. 6 ins. wide by 9 ft. high and the reductions are gradual, the smallest section being 6 ft. wide and 6 ft. high. The lower part of the sewer from the point where the Western Intercepter takes the dry weather flow, to the river, has a length of about 1,900 ft. and passes under a hill which is parallel to the river. The deepest cut required here is about 41 ft.

The Western Intercepter already mentioned is designed to intercept the sanitary flow of the Northwestern Trunk Sewer and also that of the old Broadway sewer and carry their flow to the Southern Outfall. The Broadway sewer has its outlet, at present, in the Ohio River at the foot of Broadway and this point is now entirely unsuitable for the outlet of a sanitary sewer on account of the location of the park and the proximity of the residence district. The location of the Western Intercepter is in a valley, called Paddys Run, which parallels the river and is only about one-half mile from it. This valley is a part of Shawnee Park and heretofore the odors from the waters of the Run have been very objectionable. The sewer is 5 ft. in diameter from the Southern Outfall to Broadway and from there to the Northwestern Trunk Sewer it is 42 ins. in diameter.

The Beargrass section of the city is the eastern part, the topography of which has already been described. The Beargrass Intercepter is a trunk sewer designed to intercept all sewage formerly emptying into the several branches of Beargrass Creek. The sewage from about 7,829 acres will be discharged into the intercepter. In determining the quantity of sewage to be provided for by this sewer, the tributary area was divided into districts of three classes, residential, manufacturing and mercantile. A study was made of the topography and other conditions which will affect the nature of the future development of the city and it was decided that it was reasonable to expect that 7,141 acres would be devoted to residential, 622 acres to manufacturing and 66 acres to mercantile purposes. It was assumed that the sewage from the residential districts would average 100 gals. per person per 24 hours. From the manufacturing districts provision was made for 24,000 gals. per acre per 24 hours, and in the mercantile district allowance was made for 30,000 gals. per acre per 24 hours. Added to this was an allowance of 1,960 gals. per day per acre of leakage of ground water into the sewers. In the residential districts tributary to the Northeastern Trunk and Middle Fork Sewers, the population was estimated to become 25 persons to the acre and the remainder of the residential territory was estimated at 40 persons to the acre. In computing the sizes of sewers, it was assumed that the maximum rate of flow would be double the average rate, and the intercepter has been designed to carry this quantity when running full. The largest section is 6 ft. 6 ins. in diameter.

The branches of the Beargrass Intercepter follow, in a general direction, the three branches of the creek. They are the Northeastern Trunk Sewer, the Middle Fork sewer, and on the South Fork the sewer is called the Beargrass Intercepter. The outlet into the Ohio River is at a point near the foot of Tow Head Island and is so placed as to be about 3 ft. below the ordinary 9 ft. stage of the Ohio River.

The Northeastern sewers are designed as a separate system. Most of the sewers are small and the storm water is carried away in its own system of pipes. The sanitary sewage is carried under the main channel of Beargrass Creek by means of an inverted syphon and passing under the diversion embankment follows the old bed of the creek until its junction with the main sewer. The land near the old bed of the creek is low and marshy. Tests were made here for determining the bearing power of the soil, and it was found advisable to drive piles for the support of the sewer. Three rows are driven, one row in the center of the sewer and one row under each of the side walls. The top of the sewer here is generally above ground. In carrying out the idea of a separate system for this sewer, it was found advisable to carry the structure for each sewer on the same foundation piles and (this is a concrete sewer) it was designed so as to have the sanitary sewer directly above the storm sewer, both being part of the same structure. The storm drain, however, flows east in an opposite direction to the other, and the grades are so arranged.

The foregoing text outlines the general plan and scope of the work which will be described in more detail with data on construction, methods and costs in several future articles. With few exceptions all the work is being done by contract. The organization for carrying on the work has already been mentioned. One feature deserving further notice, however, is the close record of the work which is being kept.

A complete system of determining the costs to the contractor is being kept by the inspectors on all work. These costs are turned in each week by the Resident Engineers and are compiled by the cost keeper. The expenses of the contractor are divided into three items, namely, cost of plant and equipment, materials of construction, and labor. A loose leaf system is employed for the use of the inspectors, there being several forms to fill out each day. Copies of these forms were shown in ENGINEERING-CONTRACTING for Nov. 7, 1909.

The men in charge of the work in Louisville are Mr. Harrison P. Eddy, Consulting Engineer; Mr. J. B. F. Breed, Chief Engineer; Mr. J. H. Kimball, Designing Engineer; Mr. F. C. Williams, Resident Engineer of the Southern; Mr. Harrison P. Wires, Resident Engineer of the Northwestern, and Mr. Howard S. Morse, Resident Engineer of the Eastern Districts. We are indebted to these gentlemen for assistance in securing information from which this article and those which will follow have been prepared.

(Continued from page 521.)

the usual theoretical course and in addition twelve months of practical work, all in the space of four years, the school work being arranged so that successive groups of students will furnish continuous service to the employer.

As compared with the engineering student who takes the school work only, he will be the gainer in the following respects:

1. Because of the opportunities to observe in detail the methods of production and the conduct of business, and the results of his contact with the men who are carrying on our engineering industries, he will be able to do his school work more effectively.

2. For the same reasons, he will upon graduation be of greater use to his employer. Indeed many graduates will find good positions where they have done practical work on this co-operative plan, which they can fill satisfactorily from the start. In this regard the graduate who takes his course on the co-operative plan will possess a distinct advantage over the graduate who has taken school work only.

3. The money consideration received for this practical work will be ordinarily sufficient to meet the tuition expenses for his entire course at the university. In all cases the student of engineering will be materially benefited by thus early learning from actual experience the viewpoint of the wage earner; and the money received will be to many students an item of no small importance.

Courses in civil, mechanical, electrical, chemical and sanitary engineering are offered by the School of Engineering of the university, in all of which there is incorporated the principle of co-operation. These five courses are arranged so as to be identical for the first three terms. This permits of developing the student to a certain extent along the lines which are common to all engineering before requiring him to choose the specific course he is to pursue. These first three terms are looked upon as a probationary period in the sense that the nature of the work done by any particular student during this period will determine in the judgment of the faculty whether or not he is to be advised to continue in the School of Engineering.

Work in the Engineering Industries of the Pittsburg District.—This work is conducted under actual commercial conditions and covers four terms of three months each, distributed through the middle of the student's course at the university.

The purpose of this work is to give the student of engineering an understanding of the conditions and methods of the practical side of the profession which he expects to follow after graduation. This can only be obtained by actual contact with the engineering industries, and should be acquired at the earliest possible date. The student works side by side with other employes, and gets an insight into labor conditions. He has the opportunity to observe in detail the methods of carrying on engineering work and the conduct of business from the productive standpoint, and learns much of value in his formative years which cannot be had from either his professors or books.

While the university has made special arrangements with a number of our local concerns for the benefit of its engineering students, and will co-operate with the management of these concerns in every way possible, yet the student will be considered as a direct employe of the concern. He will serve as a regular employe for six regulation working days each week for which he will receive the regular wages of a student apprentice, and shall be expected to observe strictly the rules and regulations of the company, and shall work under existing labor laws and conditions, including those pertaining to liability for accidents.

This industrial practice will be arranged so that the student will have an opportunity, as far as practicable, to engage in work pertaining to any phase of engineering in which he may be particularly interested.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Methods and Appliances Employed in Erecting the Chicago, Milwaukee & St. Paul Railway, Missouri River Brigde at Mobridge, South Dakota.*

In extending the Chicago, Milwaukee & St. Paul Ry. to the Pacific Coast in 1907 and 1908, the first great river to be crossed was the Missouri, which was intersected where the river sweeps through a flood plain one mile in width, twelve miles west of Glenham, South Dakota. On the bluff near the edge of the flood plain cut out by the river, a town site was located and named Mobridge on account of its situation. It was decided to construct a high bridge at this point, and the structure which was determined upon is shown in outline by Fig. 2, and is located as shown by Fig. 1. The bridge was designed and constructed by the Bridge and Building Department of the C., M. & St. P. Ry. under the direction of Mr. C. F. Loweth, Engineer and Superintendent of Bridges and Buildings.

The grade of the track was made at an elevation of 65½ ft. above the low water in order to allow for a clear headroom of 50 ft. above ordinary high water, as required by Act of Congress. At the site of the bridge the low water channel is 1,450 ft. in width, and the width of the high water channel is 100 ft. greater. The bridge over the main channel, as shown by Fig. 2, consists of three 420-ft. through pin connected truss spans, approached from the east by one 125-ft. deck span, and from the west by 283 ft. of steel trestle connecting to a long frame trestle, which has since been partially and will ultimately be entirely replaced by an earth embankment.

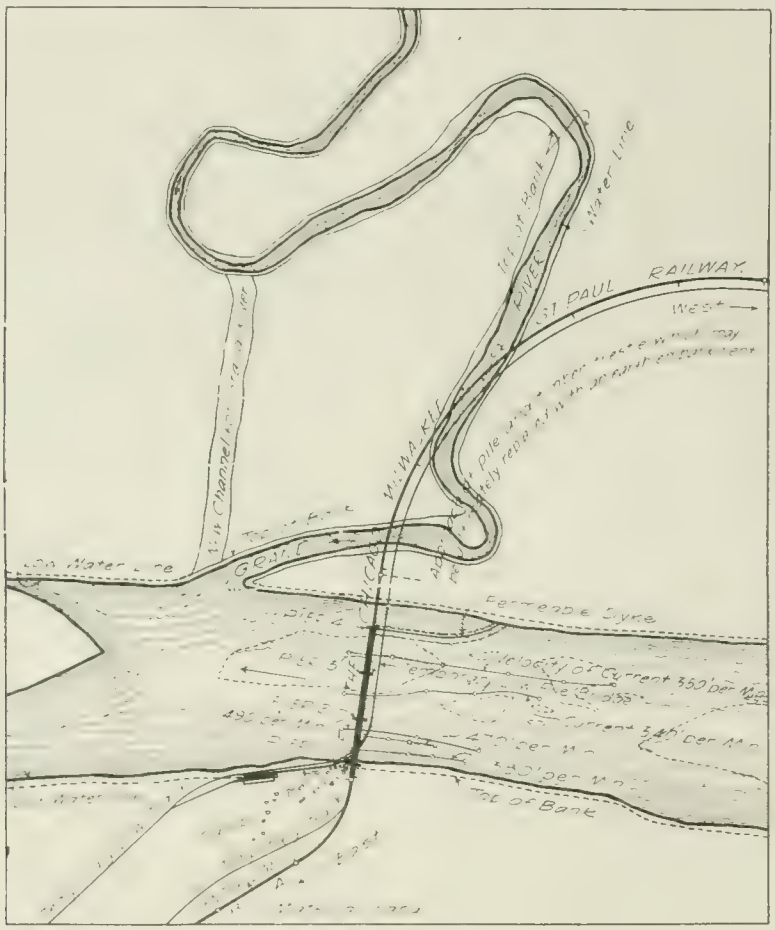

Fig. 1—Location of Bridge and Approaches at Mobridge, S. Dak.

The abutment forming the east end of the bridge is set back a safe distance from the water's edge, Fig. 2, and the trestle at the west end is protected by a permeable dyke and woven willow mattress and stone riprap, located as shown in Fig. 1.

ERECTION.

The 125-ft. deck truss at the east end and the 420-ft. main channel spans were erected on false work shown by Fig. 3, but no false work was used for the erection of the steel trestle at the west end.

A temporary pile bridge which was situated 90 ft. up-stream from the permanent bridge, as shown by Fig. 1, was driven across the river, carrying a track 13½ ft. above the low water. This bridge was put in, first to get construction material across the river for construction of the railroad during the interval in which the permanent bridge was under construction and second, to serve the construction work on the permanent bridge, although not most conveniently located for this second purpose. This pile bridge was in continuous use from the time the foundations were started until the main channel spans were swung clear of the falsework.

The main channel spans were erected on false work by means of an ordinary bridge traveler. The details of the false work for the main channel spans are shown by Fig. 4. The details show the false work to consist of pile bents *A* extending 19½ ft. above low water and supporting frame bents *B* 36 ft. 8 ins. in height, which in turn support the stringers *J* carrying the traveler track *F* and also the stringers *I* carrying the pony bents *C* which support the railway main track *G*. Bents *A*, *B*, and *C* are the several stories in the main bent *D*, which supports the truss at the panel points. Main bent *E*, located midway between panel points, carries the traveler and railway track only, and is of somewhat lighter construction, but consists of three stories similar to bent *D*.

Such of the pile bents *A*, which formed the lower story of the false work, as were driven in the ground from *E* to *F*, Fig. 3, which was above water and dry during their construction, were driven by a track driver running on a temporary track which was laid on the bents already driven, the track driver driving one bent in advance, piles being cut off and capped, and stringers and ties placed on the cap to permit the pile driver to move forward.

The piles for the false work, from *F* to *G* and *G* to *H*, Fig. 3, were carried out on the temporary pile bridge Fig. 1, on push cars and rolled off into the stream at a point opposite where they were to be driven. The pile bents *A*, Fig. 4, from *F* to *G*, were driven by a pile driver mounted on a scow located as shown in Fig. 6. On one side of the scow a longitudinal timber *A*, Fig. 6, was attached at a distance from center of the leads which would give the correct spacing of the piles from center to center of pile bents. The scow was placed with this timber bearing against the piles in the last bent driven, and the pile *B*, in the new bent driven. The driving of the remaining piles in the new bent followed, the scow being allowed to float down stream each time a distance equal to the spacing of the piles. The scow was moved down stream the proper distance each time and held in its true position by a rope *C* running from the winch head on the engine to the temporary pile bridge, and also by a rope *D* running from the winch head on the opposite side of the engine through a sheave on the deck of the scow and then to one of the piles in the last bent driven. This served to hold the scow tight against the pile bent last driven and prevented its rotation in the current.

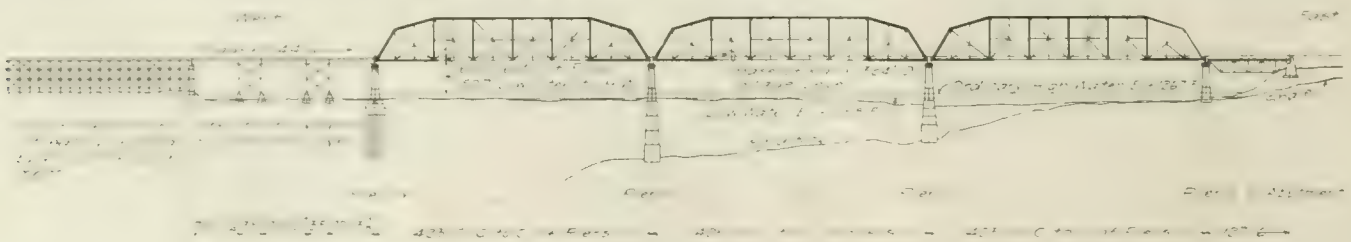

Fig. 2—Elevation of Bridge at Mobridge, S. Dak.

As shown by Fig. 4, the frame bent *B*, consists of nine 12x12-in. posts, the four outer

*Extracted from a paper by J. H. Prior, Assistant Engineer, Bridge Department, C., M. & St. P. Ry., presented to the Western Society of Engineers.

posts on each side being braced as a unit and in such a manner that these four posts could be lowered from the track on the completed bents *A* with a derrick car and braced back to the finished portion of the false work so as to support the stringers and track, thus completing a panel of false work. The half-bents mentioned, consisting of four outer posts together with their bracing, were assembled to a template on a platform on shore, the platform being near enough to the track to be within reach of the derrick car, and were then picked up by the derrick car and carried out and put into place.

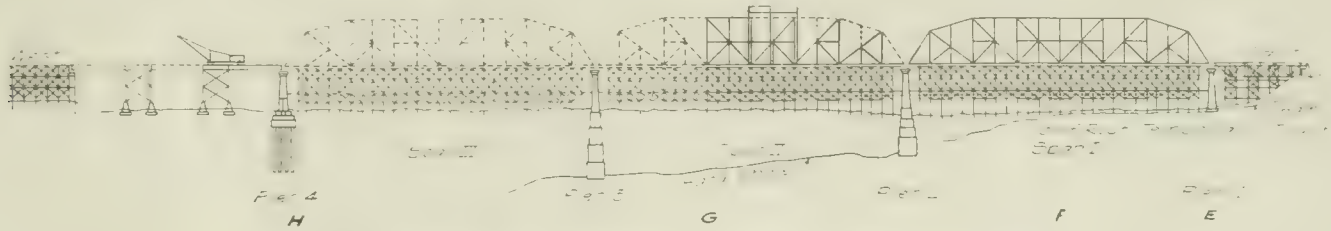

Fig. 3—Elevation of Falsework for Bridge at Mobridge, S. Dak.

The piles for the falsework bents from *G* to *H*, Fig. 3, were driven from a scow in the manner just described, but the frame bents *B* for this portion of the false work were assembled in a horizontal position on top of the pile bents and then erected into position by the derrick car one panel at a time in advance of the completed portion of the falsework, the derrick car operating from the railway track which rested on the steel floor beams and stringers. In order to permit the derrick car to operate from the railway track, it was necessary to carry on the erection of the steel floor fast enough to place the floor beams and stringers next to the end of the false work structure as soon as the bents upon which they rested were erected. As soon as erected, the bracing of Fig. 5 was placed giving stability to the bent. The pony bents *C*, Fig. 4, were not used in this portion of the falsework, the derrick car being carried by the steel floor beams and stringers, each panel of which was placed as soon as the frame bents were raised into position. Although Fig. 5 is not a sketch of this portion of the false work, it shows at *D* how the steel floor was placed from which the derrick car was operated. The material for this portion of the false work was that which had been previously used in span *I*, Fig. 3, and was now available as span *J* had been erected and swung clear of the false work.

The traveler which spanned the truss, Fig. 7, moved longitudinally on the traveler track *F*, Fig. 4, and Fig. 7. The railway main track *G* was supported by the pony bents *C*, Fig. 4, Fig. 5 and Fig. 7, until the erection had proceeded to a point where the pony bents *C*, together with the stringers which they support, were removed, and the track placed with the steel stringers and floor beams of the permanent bridge as shown at *D* and D^1, Fig. 5.

As shown in Fig. 5, the bents detailed in Fig. 4, are placed 15 ft. centers. This permitted of the use of the Railway Company's standard bridge material to a great extent without cutting, and made the second-hand timber from the bridge only slightly less valuable than new material. It was possible to make the intermediate bents *E* of lighter construction than the bents *D* at the panel points as they carry only the traveler and the railway track, the dead load of the trusses being carried by bents *D*.

The traveler used in erecting the 420-ft. spans is shown by Fig. 7, and consists of three bents 85 ft. high, made long enough to erect one full truss panel of 60 ft., or two sub-panels of 30 ft. each, without moving, and extending 3 ft. beyond the panel point at each end, in order to afford a platform for the men while making the connections at three separate panel points.

The traveler was supported by a runway on each side consisting of two rails marked traveler track F, shown by Fig. 7. A runway of two rails instead of one gave a wider platform for the engines, increased the stability of the traveler, and afforded a place for the men to stand while driving the pins and a place for them to work when the main track *G* was loaded with cars. Figure 7 shows an outline of the traveler. The detail drawings for this traveler from which the material was ordered and the traveler was framed were made in advance, but as in a device of this kind, it is not practicable to make a scientific frame structure with determinate stresses without a greater expenditure than is justified by its purpose, the details are not reproduced in this article.

As shown by Fig. 7, the traveler consists of three bents which support the stringers *D* which in turn carry the tie beams *K*, *L*, etc., from which is suspended the tackle by which the loads are handled b means of a U-bolt shown at *E*. The maximum load for which the traveler was designed, was a top chord section which weighed 52,000 lbs.

The general arrangement of the traveler lines is shown by Fig. 7. The traveler power was furnished by four 30 H. P. hoisting engines on the platforms, two on each side. Each engine had two drums and three spools as shown by Fig. 7, in a diagramatic manner. Tie beams *L*, *M* and *N* are similar to the tie beam *K*. Tie beam *K* is carried by the stringers *D*, and has passed through it a U-bolt *E* which carries the blocks *a* and *b* which are rove with six parts of ⅝-in. diameter steel cable, the lead line *ab*, of which passes through a snatch block *d* at the top of the traveler, thence to the snatch block *e* at the bottom of the traveler and thence to the forward hoisting drum *q* of the engine. From the tie beams *L* and *M*, Fig. 7, are suspended four part tackles, a^2-b^2 and a^2-b^2, and are suspended in a similar manner to the tackles from the tie beam *K*, the lead lines a^3-b^3 and a^2-b^2, of which pass through the snatch blocks *d* and *f*, respectively at the top of the traveler, thence to the snatch blocks *e* and *h*, respectively, at the bottom of the traveler, and thence to the rear hoisting drums *p* and *r* of the engines, respectively. The blocks b^1 and a^1, suspended from tie beam *N*, have similar lines arranged as shown by Fig. 7.

The tie beam *K*, in addition to transmitting the load in the tackle to the stringer *D*, acts also as a strut and prevents the lateral pull of the tackle when hanging at an angle with the vertical, from overturning the stringer *D* or pulling it laterally from its true position.

There are two runner lines from each engine which were used to raise some of the lighter members; such as the line *m*-*n* at *T*, Fig. 7, which passes from the load which it is supporting to a sheave *m* through a sheave *n*, through a sheave *t* and thence to the winch-head *X* on the engine.

In making the drawing Fig. 7, some minor details of the traveler were slightly changed to simplify the drawing. One two-sheave blocks being shown at points *D* and *N* instead of the two one-sheave blocks used at these points on the traveler.

The runner lines run out to about the points shown by Fig. 7, but were shifted some to suit conditions. The traveler was only used for the erection of trusses, the floor system and bottom laterals having been put in with a derrick car. Figure 7 shows the heavy top chord section being placed in its final position. The chord was run out on a flat car *H* to a point opposite its position in the truss. The tackles *a*-*b* to a^3-b^3 from the tie beams *K*, *L*, *M*, etc., were attached to the chord by a chain sling. The lead lines on all tackles were hauled in until the chord was lifted clear of the car. By increasing the velocity of haul of the lead line of the tackles in position *u* over those in position *y*, the load is given a considerable lateral movement bringing it to the position *W* at a low velocity but remaining under control

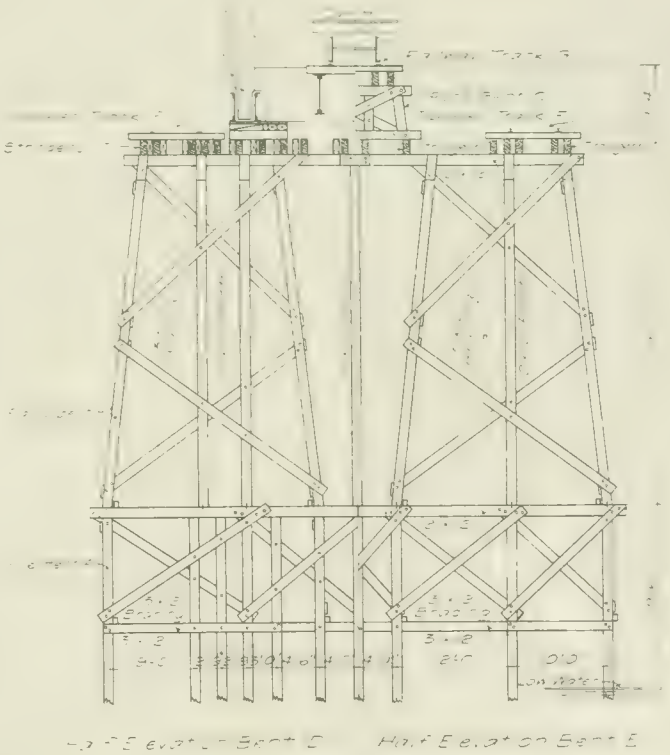

Fig. 4—Detail of Falseworks Bent.

of the tackle *y*. This makes it impossible for the load to swing laterally with a velocity which would injure the traveler if the lateral drift of the load were not controlled. After reaching position *W* it was lowered into place, connections made and pins driven.

The lighter members were raised as shown at *T*, Fig. 7, by means of a tackle from one side of the traveler only and when raised from the car were prevented from swinging laterally with any great amount of force by the snub-line *l*, which was snubbed around some timber in the traveler and played out under control, thus governing the lateral motion of the member.

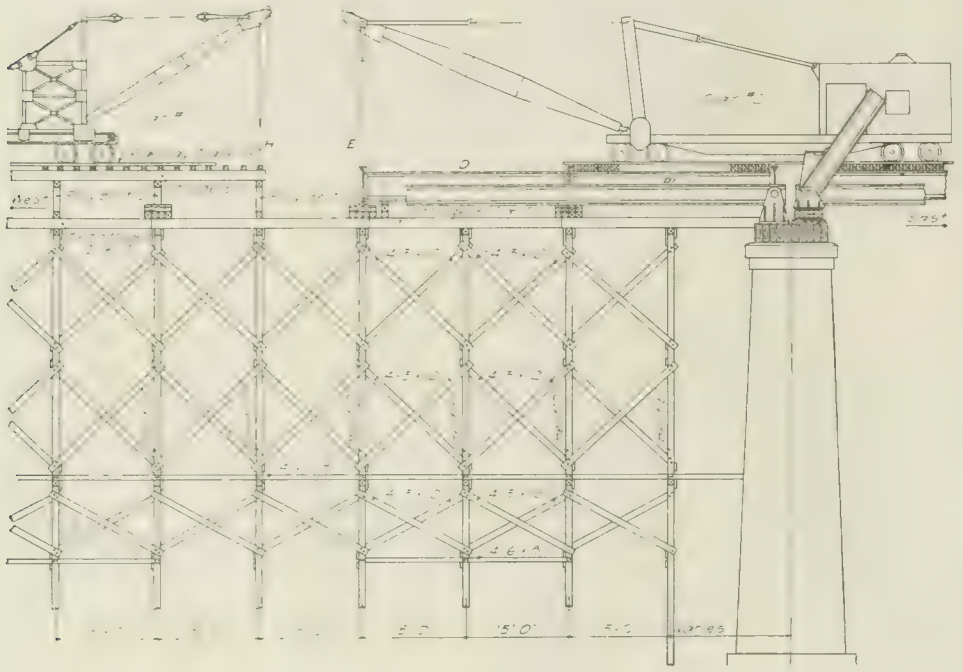

Fig. 5—Sketch Illustrating Method of Erection from E to G, Fig. 3.

The traveler received its motion on its runway longitudinally from one end of the span to the other by means of a line having its ends fastened to the piers at the ends of the span and containing enough slack to permit its being wound when required three or four times around one of the spools of the hoisting engine, as shown at *Z*.

Each bent of the traveler was framed in six sections on a platform on shore. These sections were carried out to a point on the false work where the sills of the traveler had been previously placed and bolted together. The three bents were placed partly one above the other as shown by Fig. 8, the feet of the bents being chained in their true position to the sills of the traveler, which in turn were fastened to the false work. The first bent was raised by means of auxiliary bent, *Z*, 42 ft. high, Fig. 8, by means of the seven-part block and tackle, one end of which was fastened to the top of the traveler bent and the other end of which rested on the top of the auxiliary bent, the lead line of which passed over the top of the auxiliary bent, thence down to a snatch block fastened to the false work, and thence to a spool on the engine of the derrick car. The end of the tackle nearest the auxiliary bent was a three-sheave block held by a double 2-in. manilla pendant rope passing over the top of the auxiliary bent and fastened to the false work. The bent was raised into position by hauling on the lead line, which caused the tackle to pull on the top of the traveler bent until it was revolved through the angle *A* to a vertical position. The second and third bents were raised in a similar manner except that the traveler bents already erected were used instead of the auxiliary bents.

The material yard was located as shown by Fig. 1, about one-quarter mile from the east end of the bridge. The steel was shipped to the material yard from the shops in gondola cars as fabricated and was unloaded by a derrick car. It was sorted and piled in the material yard as it was unloaded. The heavy material was unloaded on the temporary track at *C*, Fig. 1, and the lighter material was strung through a distance of a mile from *A* to *B* and beyond on both sides of the main track.

The 420-ft. spans from points *E* to *G*, Fig. 3, were erected on the bents shown in Fig. 4, on which the pony bent *C* was used. First, on account of their great weight, the shoes built up bottom chord sections and posts L^2-M^2, were erected with the traveler, the material being carried out on flat cars running on the railway track *G*, Fig. 4, which rested on the pony bents *C*, then lifted from the flat cars and placed in their proper location by the traveler tackles *a*-*b* to a^3-b^3, Fig. 7, in the manner similar to that previously described for the top chord. Following this the floor system and bottom laterals were put in by a derrick car in the following manner. In order to place bottom laterals and floor beams, the pony bents *C* and stringers *L* of Fig. 5, just in advance of the portion of the floor already placed and occupying approximately the position of the steel floor beams and stringers about to be erected, were removed by derrick car No. 1, Fig. 5, which had been backing away from the portion of the structure already erected. This derrick car No. 1 removed the temporary floor in advance of the portion of the steel work about to be erected and placed the material from the temporary floor upon the falsework alongside, where it could be picked up and carried off the structure when the floor was connected. After derrick car No. 1 had removed the panel of temporary floor immediately in front of it, it moved backward and picked up the next panel of floor to the west. Simultaneously with this, derrick car No. 2, Fig. 5, had been operating as follows: A load of floor beams and stringers were pushed out on a flat car in front of the derrick car and unloaded on the false work alongside of the track as near as possible to their final position longitudinally. The flat car in front of the derrick car was then pulled out and the derrick car returned and placed the floor beams and stringers, which it had just unloaded, in their final position.

During the entire time that the floor system and bottom laterals were put in by a derrick car, the gap or the break in the track between points *H* and *E*, Fig. 5, was open. After the floor beams, stringers and bottom laterals were placed, the track was restored and all material erected from this stage in the erection onward was brought out under the traveler on cars and erected by the traveler.

The steel floor having been placed, the end connections of the floor beams formed a convenient support to which all vertical posts could be fasteend and be made secure without much guying. These posts, together with the other web members and the remainder of the bottom chord, were next erected in the following manner. Enough material for one full panel of bottom chord and web members was run out at one time on flat cars on the railway track *G*, Fig. 7 and Fig. 4, and erected by the traveler. Pins were then driven, except top chord pins.

Starting then with the center of the span and working to the east end, the top chord sections, batter posts and top struts were put in, the pins being driven as the several panel points were reached. The traveler was then started back to the center of the span putting in the top laterals and completing the sway bracing of the span which it had just erected. The movement of the traveler continued past the center of the span to the west end, erecting the remainder of the top chord, batter posts and bracing. The pins were driven with a steel ram 6 ins. in diameter by 16 ft. long and weighing 1,600 lbs., suspended from the top of the traveler and operated by men working from whichever platform in Fig. 7 was just below the pin to be driven.

All bottom chord splices were riveted before the span was swung, and all other connections were riveted after the span was swung. Two crews of nine men each were used in the traveler, one crew on each side. An average of about 14 days was required to erect each span, counting from the time that the first work was done in placing the shoes until the span was swung clear of the false work.

The portion of the bridge from *G* to *H*, Fig 3, was erected in a similar manner to the portion from *E* to *G* except that in this portion the false work pony bents *C*, Fig. 4, and Fig. 5 were omitted, the steel floor beams and steel stringers being placed on the falsework stringers *I*, Fig. 4 and Fig. 5, and the track laid on top of the steel stringers. The laying of the ties and rails on top of the steel stringers completes the track in the panel so that the derrick car can run out on this portion of the track which rests on the erected portion of the steel floor and erect in a similar manner the floor beam and stringers another panel ahead of the completed portion of the structure as shown in the right hand portion of Fig. 5.

On acocunt of the danger of the approaching high water, the erection of the steel followed closely on top of the erection of the false work, from the point *G* to *H*, Fig. 3.

One derrick was either employed in upending the frame bents *B*, Fig. 4, which were assembled on tops of the pile bents *A* below or else was employed in placing the stringers. As soon as the panel of falsework had been completed, this car moved back to pick up and place the steel floor beams and stringers necessary to complete the panel. In this way the erection of the false work and the erection of the steel upon it were carried on practically simultaneously.

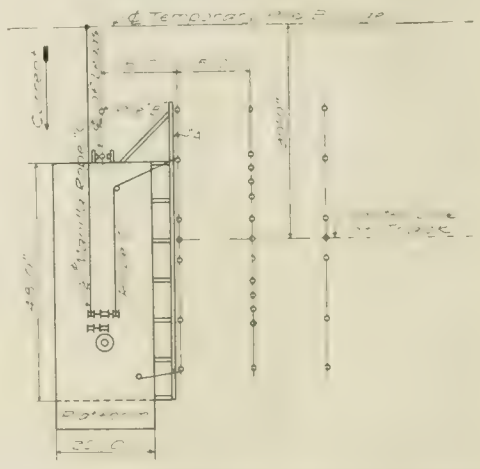

Fig. 6—Sketch Showing Method of Driving Piles for Falsework.

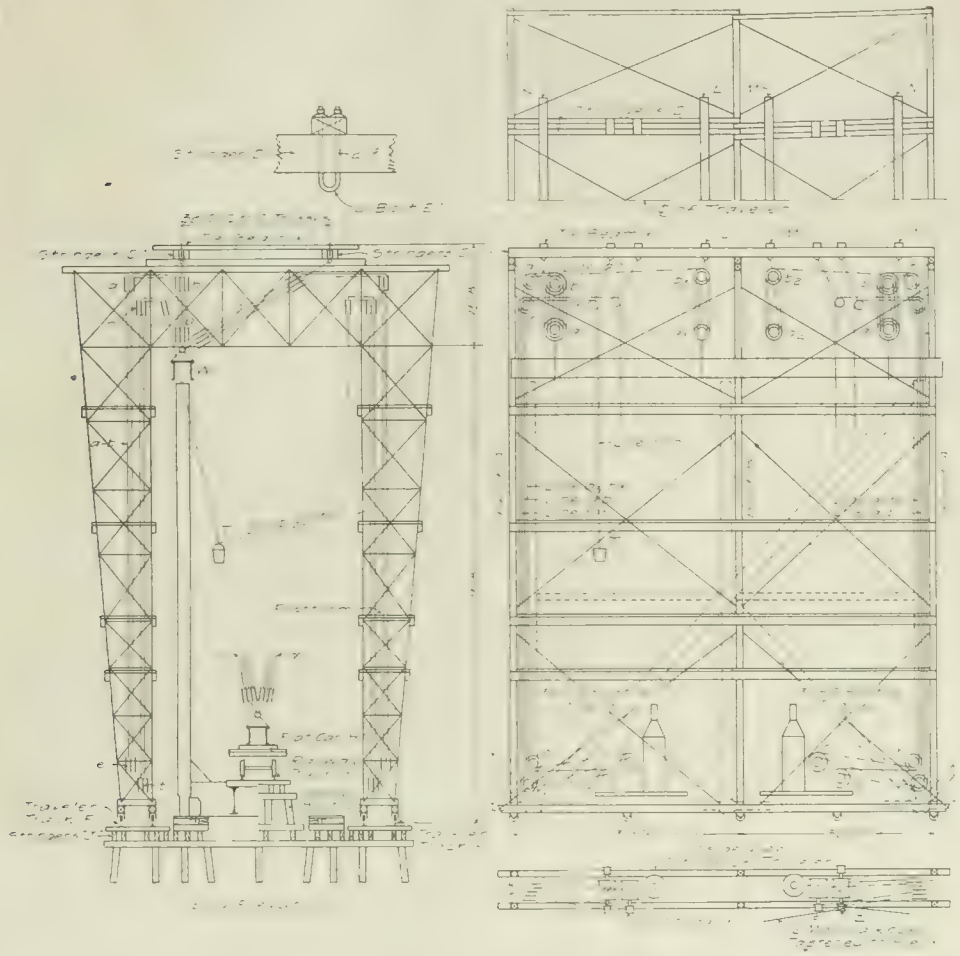

Fig. 7—Traveler for Erecting 420-ft. Spans.

The end posts, or the end top chord section, at one end are the last members of the truss to be erected as previously described. This is due to some features of camber blocking shown in 13, 14, and 15 of Fig. 9. In 15 in full lines at B is shown an outline of the truss when subjected to the dead load of its own weight. In dotted lines at C is shown to an exaggerated scale an outline of this truss when resting on the camber blocking, each panel being distorted as is shown in dotted lines and to an exaggerated scale at D in such a manner as to make the diagonal distance b less than the diagonal distance c and less than the true fabricated length of the member which will be located in the diagonal b. It is a simple matter to give each panel the shape shown at A be means of camber blocking as the rectangle, the top and bottom of which are formed by the top and bottom chords respectively and the sides of which are formed by the posts, approximates a four-sided figure each side of which consists of a stiff member but which is hinged at the corners. As the length of the diagonal distance b is less than the member occupying this position, by decreasing the amount of camber blocking, the panel at A can be brought toward a position shown by light lines E in which the distance center to center of end pins on diagonal b is exactly equal to the distance center to center of end pins of the member which occupies this position in the structure, allowance is, of course, made for the conditions of sag, temperature, etc., under which the member is being erected. This use of the camber blocking permits making the necessary adjustments so that all members of the truss can be erected except the closing side. If the center section of top chord 13, Fig. 9, is chosen for the closing member, any error between the fabricated length of the top chord and the space left for it in the truss in amount equal to e would make it necessary to alter the elevation of truss by the amount d equal to $\frac{f \times e}{g}$, but if the end post is chosen as a closing member the total amount of vertical movement required for a similar error of like amount is shown in 14, Fig. 9, to be $\frac{f \times e}{g}$ or about three-fifths of the foregoing. An advantage is also obtained through the pin connection at either end of the end post which permits of the use of the large force available from a pilot nut driven by a ram to force the last member into position.

The steel trestle approach at the west end, Fig. 3, for which no false work was built was erected as follows: As the bridge was erected from the east toward the west, it was necessary to carry the material for the steel trestle through the 420-ft. spans. As the portals and the transverse bracing for these spans limited the clear head room, it was impossible to bring out columns for the steel trestle suspended from the boom of the derrick car, without fouling the transverse bracing of the trusses. Two columns, therefore, were loaded on a flat car which was pushed out ahead of the derrick car to a point near the west end of span III, Fig. 3, adjoining the trestle approach. The columns were then lifted from the car by the derrick car boom, one column being placed each side of the track resting on the floor beams, as there was sufficient room to store these in this position for a few hours. Following this, two panels of transverse bracing for one bent and laterals for one girder span were loaded on a flat car in the same manner, pushed out and unloaded on a few temporary timbers laid from the top flange of the stringers to the bottom chord of the truss. The lateral bracing for one girder span which had been placed on the same car with the transverse bracing for the bents, was unloaded by being merely thrown from the car onto the track between the rails, members being light and containing no large projecting gusset plates, their position between the rails did not affect the clearance for cars moving over them.

The flat car was then pulled in the clear, the derrick car returned and picked from its position one column to the top of which had been fastened longitudinal and transverse guy lines. The derrick car moved forward with the column at the end of the boom on the portion of the structure already completed, the length of the boom, 80 ft., permitting it to place the column a full span in advance of the completed portion of the structure. The remaining column of the same bent was placed in a similar manner and the two upper panels of transverse bracing were placed by being carried out on the boom of the derrick car and lowered by runner line into place. When the connection of these two upper panels had been bolted and driven the column was stable transversely, and longitudinal guy lines made it also stable longitudinally.

This completes any panel to the situation shown by the position of the derrick car by

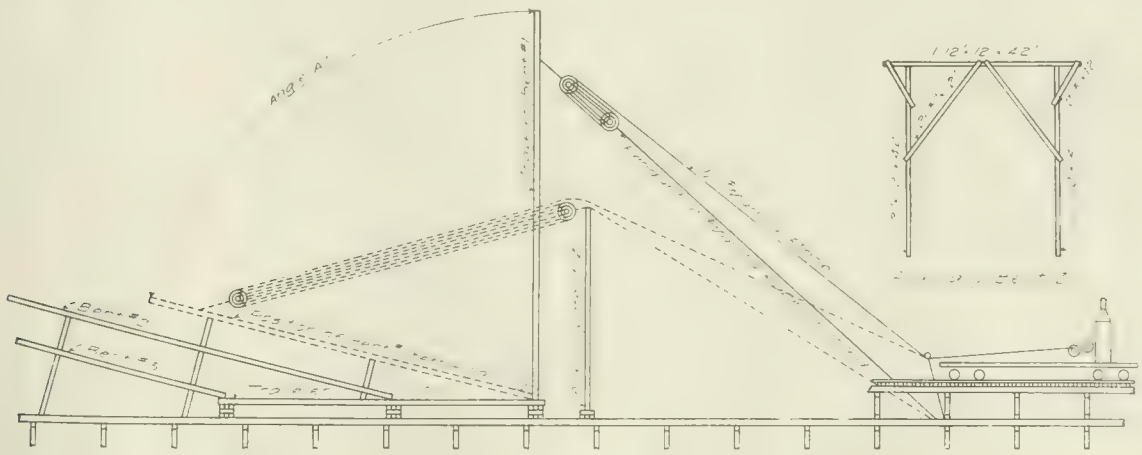

Fig. 8—Sketch Showing Method of Raising Traveler Bents.

Fig. 3. As shown by this figure the girder was then brought forward on the boom of the derrick car and lowered into position, being held by the tackle until the ends were bolted and until the nearest end of the girder had been guyed. The second girder of the span was then placed in a similar manner. The girder cross frames were then placed with a runner line from the boom of the derrick car, and the top and bottom laterals were placed by hand and bolted to the lateral plates which had in turn been bolted to the girder before it was lifted from the car. Next the derrick car returned to shore and brought forward, suspended from the boom, ties for the girder

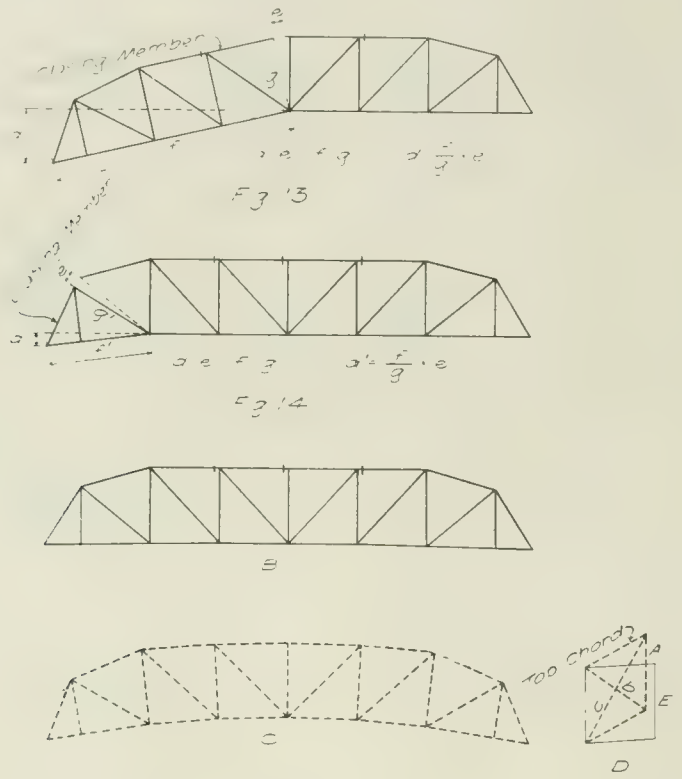

Fig. 9.

span. These ties were lowered to the deck and simultaneously the bridge carpenters commenced separating the ties and laying the track rails while the iron men were placing the longitudinal tower bracing with the boom. This operation completes the erection of the bridge.

Material for this article was obtained by the writer in his work as assistant engineer in charge of the drafting room of Bridge and Building Department of the C., M. & St. P. Ry.

The Universal Portland Cement Co. has recently adopted an accident relief plan for the benefit of its employes, corresponding to one which has been made operative among all the subsidiary companies of the United States Steel Corporation. Under this plan an employe injured in the performance of his services is paid weekly a fixed proportion of his wages, determined on terms of service and whether he is married or single. In case of permanent disablement stated sums based on wages are paid for stated injuries, and in case of death stated sums, also based on wages and on the number of those dependent on the worker, are paid to the family. The money for this fund is to be furnished entirely by the company. This plan will be tried for one year and its operation studied for future action.

An aeroplane flight from Albany to New York city, a distance of 137 miles, was made on May 29, 1910, by Glenn H. Curtiss, in the time of 2 hours and 32 minutes, giving an average speed of 54.06 miles per hour. One stop of about an hour was made at Poughkeepsie, N. Y.

The Average Car-Mile Cost of Operating Seventy-Five Electric Railways in New York State, Second District.

All steam and electric railways in New York State report to one of two public service commissions. The commission in charge of the "first district" receives the reports of all railways in the city of New York. The commission in charge of the second district receives the reports of railways operating in New York State outside of New York City. The commission's report for the second district for the year ending Dec. 31, 1908, includes an itemized statement of the operating expenses of each of 75 electric railways. Very few totals or averages, however, are given in this report, but the data are so important that we have expended no slight amount of labor in ascertaining the totals for these 75 railways, from which we have deduced the average operating expenses, using a Thatcher cylindrical slide rule for the latter purpose.

Of the 75 electric railways reporting, 72 had a total of 85,445,439 car miles; the other 3 did not report their car mileage for the year 1908, but from previous reports we are able closely to approximate their car mileage, and thus find that the grand total was 85,642,000 car miles for the 75 railways.

The average operating expense during 1908 was as follows per car mile:

	Cents per car mile
Maintenance of Way and Structures:	
1. Track and roadway	1.502
2. Electric line	0.453
3. Buildings and fixtures	0.091
Total Maintenance of Way, etc.	2.046
Maintenance of Equipment:	
4. Steam plant	0.060
5. Electric plant	0.068
6. Cars	0.765
7. Electric equipment of cars	0.609
8. Miscellaneous equipment	0.039
9. Miscellaneous shop expense	0.125
Total Maintenance of Equipment	1.669
Operation of Power Plant:	
10. Power plant wages	0.345
11. Fuel for power	0.176
12. Lubricants and waste	0.023
13. Miscel. supplies and expense	0.039
14. Hired power	2.463
Total Operation of Power Plant	3.046
Operation of Cars:	
15. Superintendence of transportation	0.335
16. Wages of conductors	2.507
17. Wages of motormen	2.579
18. Wages of miscel. car service men	0.250
19. Wages of car house men	0.448
20. Car service supplies	0.124
21. Miscel. car service expense	0.324
22. Hired equipment	0.045
23. Cleaning and sanding track	0.125
24. Removal of snow and ice	0.109
25. Undistributed expense	0.063
Total Operation of Cars	6.901
General Expense:	
26. Salaries of general officers	0.333
27. Salaries of clerks	0.281
28. Printing and stationery	0.046
29. Miscel. office expense	0.064
30. Store expenses	0.046
31. Stable expense	0.033
32. Advertising and attractions	0.138
33. Miscel. general expense	0.344
34. Damages	0.985
35. Legal expense due to damages	0.048
36. Miscel. legal expense	0.072
37. Rent of land and buildings	0.050
38. Rent of tracks and terminals	0.197
39. Insurance	0.208
Total General Expense	2.845
Grand Total Operating Expense	16.498
Taxes Accrued	1.222
Total Operating Expenses and Taxes	17.720

There were 4.108 passenger fares collected per car mile, the average rate being 5.692 cts. per passenger, making a passenger revenue of 23.39 cts. per car mile. Additional revenue from operating (express, freight, advertising, etc.) brought the total operating revenue to 24.742 cts. per car mile. Hence the operating ratio (16.498÷24.742) was 66.7 per cent.

The track mileage was as follows:

	Miles
First track	1,784
Second track	598
Total trackway	2,382
Switch, sidings and car house	147
Grand total track	2,529

The rolling stock was as follows:

Passenger Cars:	
Closed	1,809
Open	1,240
Combination	50
Semi-convertible	621
Combined with express	40
Total Passenger Cars	3,730
Other Cars:	
Baggage	12
Express and freight	155
Miscellaneous	4
Total Other Cars	171
Service Cars:	
Snow plows	173
Sweepers	49
All others	348
Total Service Cars	570
Grand total	4,591

The 3,931 revenue cars are equivalent to 1.65 cars per mile of trackway.

The following statistics are per mile of trackway (2,382 miles of first and second track):

	Per mile of trackway
Car miles	35,953
Operating expense	$5,932
Operating revenue	8,899
Maintenance of Way and Structures:	
1. Track and roadway	$576
2. Electric line	127
3. Buildings and fixtures	33
Total Mn. of Way and Strs.	$736

The number of car miles per mile of trackway (35,953) is less than half the number on the average steam railway in America, the latter being 78,540 car miles per mile of trackway (see Gillette's "Handbook of Cost Data," 2d edition, page 1,460).

There were 3,931 revenue cars, and they averaged as follows per car:

	Per car
Car miles	21,783
Maintenance of Equipment:	
6. Cars	$167
7. Electric equip. of cars	131
9. Miscel. shop expense ($90,000)	22
Total Maintenance	$320

We have prorated the item (9) of miscellaneous shop expense.

It will be seen that the maintenance of each operating car cost $320. This is almost exactly the same as the average maintenance cost for the electric cars of all the railways in Massachusetts (Gillette's "Handbook of Cost Data," page 1449), whose first cost averaged $4,000, and half of which cars were open cars used only in the summer. About 40 per cent of the electric cars in this second district of New York state were open, and it is

highly probable that the average first cost was about the same as in Massachusetts. This would indicate that 8 per cent of the first cost of cars is annually spent in maintenance; but, as nearly half the cars are idle at any given time (the open cars not running when the closed cars are in use, and vice versa), it would appear that the annual maintenance would approach 16 per cent of the first cost if all cars were in service throughout the year.

The number of car hours is not reported for all the roads of the second district, but an average of more than half the car mileage shows 8.7 car miles per car hour. This is a rather high schedule speed, and accounts largely for the fact that conductors' and motormens' wages aggregate only 5.077 cts. per car mile, as contrasted with 6.962 cts. for the New York City Ry. Co. lines (see ENGINEERING-CONTRACTING, May 4, 1910), whose average schedule speed was 7.56 miles per hr.

In studying the operating expenses it will be noticed that only a small percentage of the electric power was generated by the railway companies. Unfortunately the number of kilowatt hours used is not reported. In this, as well as in several other respects, the reports made by the Commissioners of the First District is much more satisfactory. The reports of neither district give the average weights of equipped cars, which is an exceedingly important factor in judging the economy of operation. The old railroad commission of New York State used to require reports of the *maximum* weights of cars of each class, but this was futile, for it is the *average* weight that determines the resistance to acceleration, which is often the main resistance encountered in operating street cars. The average weight also makes it possible to estimate the first cost with considerable accuracy, and the first cost largely determines the cost of maintenance.

It is to be hoped that future reports of the Public Service Commission of the Second District of New York will give the number of employes of each class and their respective wages. With these suggested additions, the report will be entirely admirable and hardly susceptible of much improvement until an appraisal shall be made of the physical property of the electric railways. This must inevitably be done, for without such an appraisal no precise interpretation of the maintenance costs is possible, to say nothing of the impossibility of a scientific determination of the reasonableness of rates.

The Street Railway Association of New York has distributed the following compilation of operating statistics (for 1908), relative to the 75 electric railways under consideration:

Maintenance of way and structures	$ 1,754,505
Maintenance of equipment	1,422,599
Cost of power	2,608,755
Conductors and motormen	4,351,391
Other transp. and traffic expense	1,558,187
General expense, incl. insurance	1,551,335
Damages and legal expense	884,625
Rentals	214,567
Taxes	1,046,913
Interest	1,270,515
Total	$19,663,342
Operating revenue	$21,194,486
Surplus	$ 1,531,144

This statement would show a low surplus, or true profit, if the item of interest, $4,270,515, were known to be a fair rate of interest on the actual cost of reproducing the property. This interest, however, amounts to $1,792 per mile of trackway, which capitalized at 4½ per cent, is $39,825. The question then remains whether a less amount than $39,825 would reproduce a mile of trackway and its equipment. There is not the slightest doubt, as we shall show in a subsequent issue, that such trackway (with its 1.65 cars per mile and its corresponding power equipment) could be reproduced for less than $30,000 per mile, or about 75 per cent of the $39,825. Hence if we deduct 25 per cent of the $4,270,515 interest and add it to the $1,531,144 surplus, we shall have $2,598,800, which is approximately the true profit, and this is 12¼ per cent of the gross operating revenue. This is not an enormous profit—probably less than the average derived from sales in mercantile or manufacturing businesses.

As shown editorially in our issue of May 25, this method of viewing profits as a percentage of gross receipts is the only rational one, but it necessitates a knowledge of the money invested or the cost of reproduction. The interest (4½ per cent or thereabouts) on the invested capital should be regarded as a part of the actual cost of producing any article, whether it be a cubic yard of concrete or a car mile of transportation. Having deducted this interest, operating expenses and taxes from the gross operating revenue, we have left the true profit, which should be rated as a percentage of the gross operating revenue, in order to make equitable comparisons not only with other public service corporation profits but with the profits of other classes of business entirely. We have previously pointed out that it is fundamentally fallacious to fix the profits of a public service corporation as a percentage of the cost of reproduction, for this is merely an invitation to extravagance of construction and a tax on those who, by inventiveness or otherwise, are able to accomplish the same result with a less expensive plant.

Advices from Goldfield, Nev., state that $5,000,000 of capital has been secured in Europe for the construction of the proposed railroad between Goldfield and a connection with the Nevada Northern. On the southwest it is planned to make a connection with Tonapah & Tidewater R. R. C. B. Zabriskie, 100 William St., New York City, President of the Bullfrog Goldfield R. R. and Secretary of the Tonapah & Tidewater R. R., is reported to be head of the new line.

A bill has been introduced in Congress to extend for 18 months the time for the construction of the East Washington Heights Traction R. R., Central National Bank Bldg., Washington, D. C. This additional time is granted with the provision that the track extension from the present eastern terminus to Branch Ave. be completed within six months.

Method of Constructing Two Public Comfort Stations in Small Cities with Some Costs of Construction and Operation.*

PUBLIC SANITARY STATION, BROOKLINE, MASS.†

This structure was built during 1909 and is located on public land in Village square, through which several lines of street cars to and from Boston pass at the rate of one per minute in both directions during the rush hours. It is also located in the most densely settled part of the town, at the junction of several main avenues on which there is much teaming. The location would therefore seem to be as nearly ideal as anything of the sort could be in a town of about 27,000 population.

The details of the design are shown by Figs. 1 and 2, by which it will be noted that a room

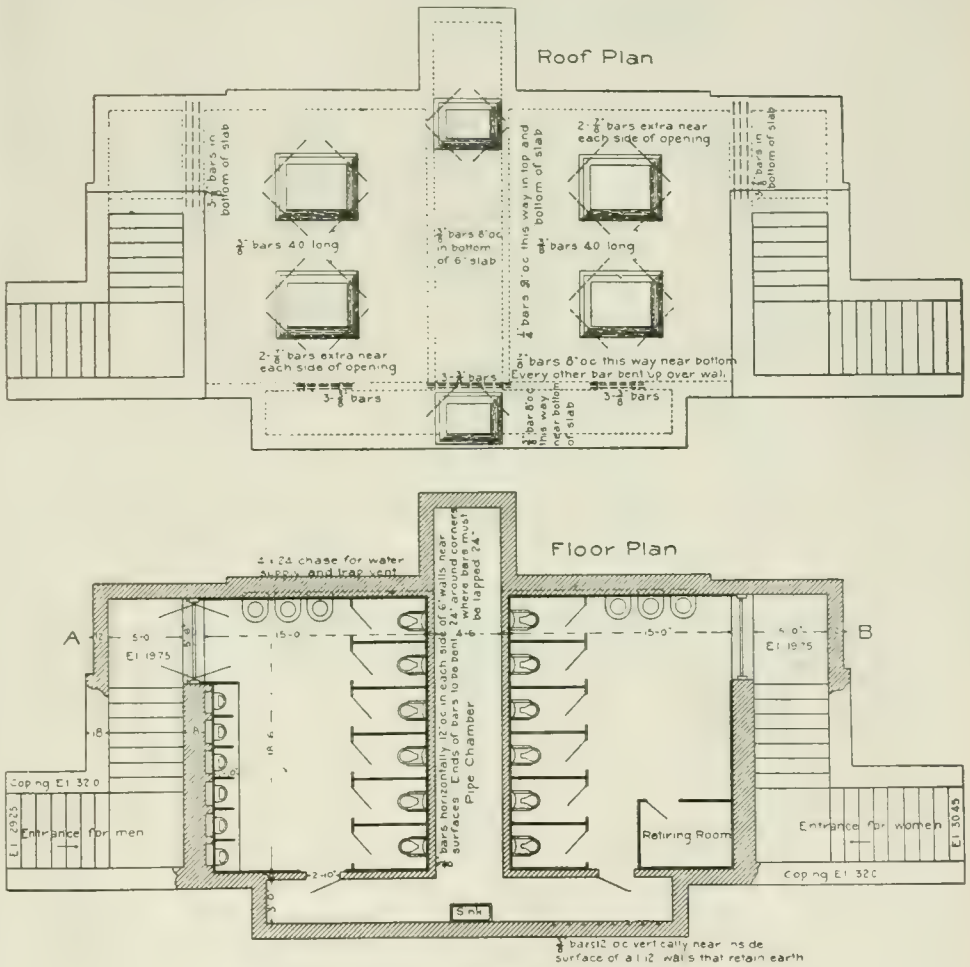

Fig. 1—Plan of Public Comfort Station, Brookline, Mass.

15x18.5 ft. in dimensions, with 6 water closets, 6 urinals, 2 lavatories and a bubble drinking fountain is devoted to men, and a room of the same size containing 6 water closets, 2 lavatories, a bubble drinking fountain and a small retiring room is designed for women.

The structure is built of Portland cement concrete mixed in the proportion of 1:2½:5, reinforced as shown by the drawings. The floor of the men's side is placed 9 ft. below the walk, the ceiling is 8.5 ft. high and a roof covering with from 2 to 3 ft. of loam, the entrances and grading so designed as to render the sanitary as inconspicuous as possible. It will be noted that the entrances are designed with covered vestibules and right-angle turns in the stair cases, thus securing the maximum of privacy. The ground over and adjoining the sanitary has been planted with shrubbery.

The sanitary is well lighted during the day with six light shafts arranged as shown, in which are placed 2¾-in. luxfer prism sidewalk

*Condensed from papers read before the Boston Society of Civil Engineers and printed in the Journal of the Association of Engineering Societies for April, 1910.

†Alexis H. French, Town Engineer, Brookline, Mass.

lights spaced 4 ins. on centers. During dull weather and at night it is lighted by electric lights controlled by suitably arranged switches.

The roof and walls are waterproofed by the application of a heavy coat of roofer's pitch and also with five layers of roofer's felt combined with hot pitch for a distance of 2 ft. below the roof and by the use of three layers of felt to a level of 4 ft. below the roof. No special precaution was taken to waterproof the bottom, as the level of ground water was much below that elevation.

On account of its non-absorbent character and freedom from stain, the gray Tennessee marble was used for the water closet partitions, urinal stalls and wainscoting, the height being 6½ ft. in the case of the water closets and 6 ft. elsewhere. White vitreous 3x3x½-in. tiles were used in the main rooms on account of their non-absorbent character and great durability.

A feature of the design which it is expected

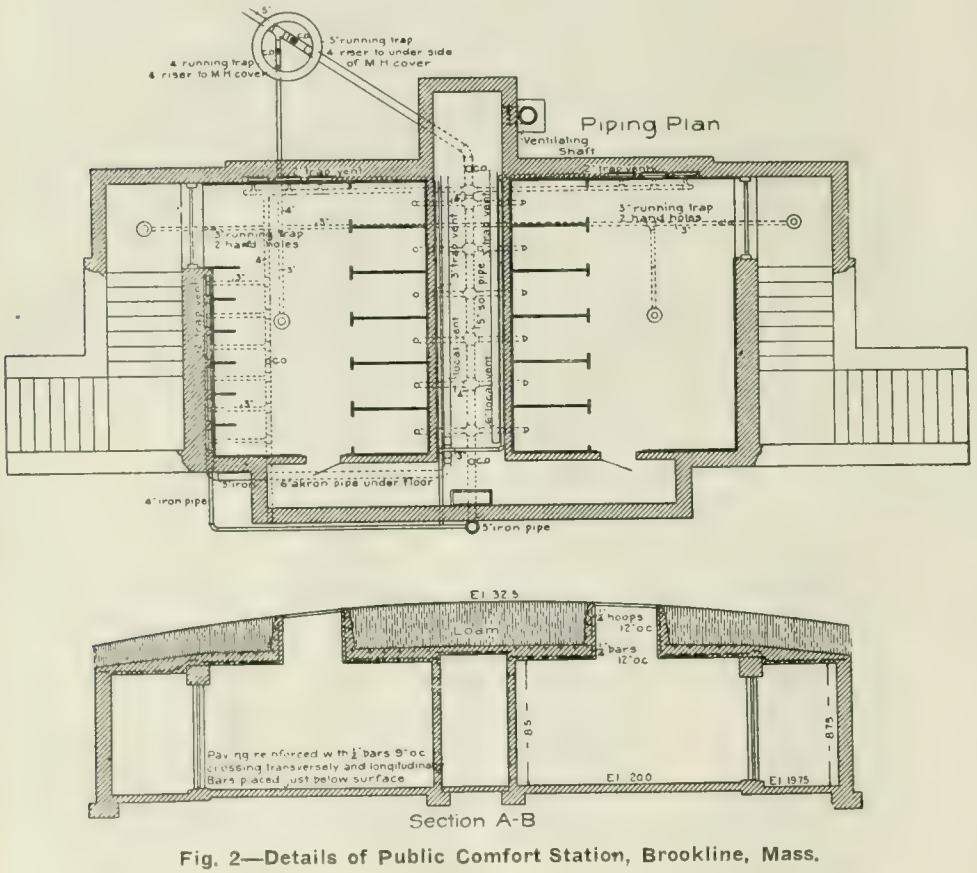

Fig. 2—Details of Public Comfort Station, Brookline, Mass.

will work well in operation is the pipe chamber and passageway, in which are located the main soil pipe with its branches and cleanouts, the trap ventilation, water closet tanks and connections, ventilating fan and conduits, slop sink and space for the storage of supplies. Such pipes as are placed below the floor of the main rooms are made accessible by cleanouts with brass cleanout screws.

Brass floor drainers are placed in the vestibules and in the center of each main room, with waste pipes connected with the main drain below the main trap in the manhole, so that a stoppage of this trap will not cause the sewage to set back into the sanitary.

The type of water closet adopted is the "Sanitas Keystone" for the men's side and the "Sanitas Keystone Hygic" for the women's side, both designed and made by the Sanitas Manufacturing Company of Boston. They are syphon jet closets and are especially well adapted for a public sanitary because of the form of the bowl and its rim, and the unusually large water area. The exterior of the closet is commendable from its simplicity and in that it does away with the space behind the bowl, which too often serves as a hiding place for dirt. The closet is also provided with an unusually large local vent.

The water closets are so designed that each closet contains a bowl and a push button device for operating the tank that has been satisfactorily used at the south terminal station in Boston for ten years, modified to meet modern plumbing requirements. These also have a large local vent connected with a copper ventilation pipe placed in the wall behind the urinals and leading to the ventilation fan.

A system of ventilation has been adopted, but not yet installed, consisting of an electrically operated fan to be placed in the pipe chamber near the ventilation shaft, with ducts leading to each closet and urinal, so that the air in the sanitary can be exhausted through these fixtures at the rate of once in fifteen minutes. It is believed that this will be ample to keep the air good under the worst conditions.

The building is heated from the hot water system in the fire station plant, only 10 to 15 ft. away, and is designed on the basis of 1 sq. ft. of radiation for each 40 cu. ft. space to be warmed. In addition to this, a 9-ft. radiator is placed in each light shaft to aid in the warming and to keep the snow melted in winter.

PUBLIC SANITARY STATION AT LAWRENCE, MASS.*

For a long time agitation for a public station for both sexes had been carried on in our city, and in 1907 its construction was made possible by a vote of the city council authorizing the park commission to spend $12,000 for what the order termed a "comfort station," and the city engineer was directed to prepare plans for it.

Considerable opposition to its construction developed after the order appropriating the funds was passed, especially when the yearly expense of running it was considered, which expense would amount to considerably more than half of the usual appropriation for the maintenance of our public parks. There are probably now many prominent citizens who, if they expressed their opinions, would be opposed to its continuance. One man, a would-be mayor, told me would make a swimming pool of it if ever he had a chance; and another, an ex-mayor, said he would fill it in if he should happen to again occupy the mayor's chair. He had an idea that no decent woman would visit it. I told him that it was not used much by the so called foreigners, but that nicely dressed women, apparently of the English speaking races, used the station largely, and it was with a good deal of pleasure that we could refute the charge that only foreigners would use it, and say that it was really a convenience station to all classes of our citizens. The attendants tell me that the women's side is used by a better class than the men's. I mention these things to show that no matter how good a piece of work may be, how much it may be needed, or how economically it may be carried out, there is always adverse criticism if the public has to foot the bills, and I presume these conditions prevail not alone in Lawrence but are common to most municipalities. The staion in Lawrence was opened to the public on December 30, 1907, and within a week it was estimated that between five and six hundred persons used the station daily. On special days and Sundays the place is visited by four or five thousand on each side, and its necessity and value have been proven beyond the possibility of contradiction.

The attendants examine every closet after it has been used and the station now is in as perfect condition as when first constructed. Not a dollar has been expended on repairs, and no plumber has been called in to remove any obstructions or remedy any defects.

The interior of the building was made as white and as spotless as possible, so that no dirt could exist there without being plainly seen. The interior walls are of brick and all exposed surfaces are built of white enameled brick, with a base of three courses of chocolate colored enameled brick. The closet bowls are set in the usual open plumbing style; the urinals are of solid porcelain and run to the floor, so that the smallest boy can use them properly; the water closet and urinal partitions are of white Italian marble, said to be harder and less absorbent than any marble quarried in the country; the floors are of terrazzo, made of bits of stone embedded in cement, the prevailing color being white, with a neat mosaic border, all on a foundation of concrete; the ceiling is of concrete, painted white with one coat of "Bay State Brick and Cement Coating," followed by a coat of "enamel" of the same brand. It would have been better to have put on two coats of the first, as the ceiling did not come out quite as white as was desired.

The main toilet rooms are lighted by day by two skylights in each, 3x4 ft. in size, and at night by electric lights inclosed in Holophane globes. The effect of the whole is bright, fresh and clean. The electric lights are divided into five circuits, which are regulated from a switchboard in the main pipe room. These circuits are men's room and light at foot of stairs, women's room and light at foot of stairs, the transparency on men's side, the transparency on the women's side, and the attendant's room and pipe room.

The station has also a "Gamewell Police Signal Box," which serves as a call box for the officer on that beat during the hours the station is open. This box connects only with the police station and, aside from that, the station has no telephone.

The general plan of the station includes the two main toilet rooms, about 15x25 ft. in size, with a 9-ft. post. Each of these rooms contains six water closets. In addition to the closets the women's room has three lavatories and also a long seat built against the wall. The closet slips are 2 ft. 10 ins. by 4 ft. 10 ins. in size from center to center of the marble partitions. The men's room has two lavatories and eight urinals. The two radiators in each of the toilet rooms are inclosed in white marble, with white porcelain enameled registers to allow the circulation of the air. A man would not be likely to try to spit through the registers and he certainly cannot spit behind the radiators.

In addition to the main toilet rooms there are two attendants' rooms and two pipe rooms. The main pipe room, 5 ft. wide, with its floor grade 3 ft. below that of the toilet rooms, runs through the center of the structure. This main pipe room should have been at least a foot wider, for unless the plumber utilizes every inch of width, as he did not in

*Arthur B. Marble, City Engineer, Lawrence, Mass.

our case, and carefully sets the heaters, there will hardly be room enough for a man to get by the large heater into the space beyond. In this main pipe room are all the pipes, flush tanks and vents connected with the water closets, together with a Gurney heater, which in the winter heats the rooms and the water for the lavatories; also a small jacket heater for heating water and maintaining ventilation in summer. The small heater is run continuously all summer and burns two tons of coal. A total of about 8 tons of coal is used in both heaters for the year. Directly in front of the heaters (the door from the attendants' room opening between the two) is the coal bin, with a capacity of 6 tons. The bin is fed through a coalhole in the roof. On the side of the men's room back of the urinals is another pipe room, with its floor 2 ft. below that of the toilet room, in which are located the flush tanks and piping for the line of urinals. There are four flush tanks in this room, one for each two urinals, and they discharge automatically at intervals of about two minutes.

The ventilation of the station is secured entirely through the water closet seat vents, which are about 13 sq. ins. in sectional area and pass through the wall back of the closets to the main galvanized iron vent pipe, which is connected with a cylinder that surrounds the smokestack and reaches the open air near the top of the copper ventilator that stands on the roof of the station and extends to a height of about 15 ft. above the ground.

The seats of the closets are of wood, entirely cut away in front. We at first thought of having a porcelain seat, but they were said to be very unpleasant to sit on, so we adopted the kind described.

The attendants' rooms are 7x12 ft. in size, with a quartered oak wardrobe filling the entire width at one end. These rooms are large enough for one or two chairs and also a couch, which we thought might be needed in case of any sudden illness. These rooms furnish a convenient place for the attendant to sit apart from the general toilet room, and is so located as to command a view of nearly that entire room. There is a door leading into the pipe room from both attendants' rooms, so that in case of a disturbance on the women's side the male attendant can be called in without his having to pass around on the outside. With the door locked on the women's side the protection for that side is as perfect as though there were no door there. The attendants' rooms are ventilated each by a window hinged at the bottom, opening into the stairway landing. The men attendants of course do the heavy work, caring for the heating apparatus, taking out the ashes and shoveling snow in winter. They receive $14 for a week of seven days. The women receive $10.50 for a week of the same length. Both the male and female attendants keep the brass work polished on their respective sides.

The structure was built underground so as not to disfigure the Common, and also to avoid the expense of exterior architectural ornamentation. Nothing appears above ground except the copper covered ventilator and smokestack, which is rather ornamental, and the stone parapets with the wrought iron fences which inclose the entrance stairways. Over each entrance is a wrought iron arch carrying a transparency bearing on one the word "men," and on the other, "women." These transparencies show milk white glass letters by day and are illuminated at night.

The outside walls of the structure are built of concrete and the roof is a flat slab of reinforced concrete, both walls and roof being covered with Warren Brothers' water-proofing material. As the walls are lined with brick inside, an air space was left between the outer and inner walls, and this air space would probably have kept the interior walls dry without any water-proofing. The excavation was somewhat wet as we neared the floor grade, and two broken stone drains were laid across under each toilet room floor, terminating in an open pipe laid through the wall into the main pipe room. The main pipe room is drained of ground or surface water into the trap of the main drain. With these drains and the bed of cinders under the concrete floors, no dampness ever shows on the terrazzo. To further protect the walls against dampness they were backed up with cinders.

The interior of the station can be washed out with a hose, if desired, and the floors are drained into a cesspool in the center of each toilet room, and in the landing at the foot of the stairs. The last named cesspool also takes the rain water which finds its way down the stairs.

In addition to the conveniences sure to be found in such a station, paper and liquid soap are furnished free of charge. The paper is delivered from two Springfield paper holders in each toilet room. The paper used costs about $7 per month and the soap about $25 per year. A roller towel was at first hung up in each toilet room and nickel plated rollers were attached to the walls for them to run on. Of course they never should have been even thought of, but the Park Commission was impressed with the idea that the popular demand required them. However, they were soon discarded as unsanitary, and the material was cut up into individual towels, and given to the attendants, who take care of them and let them out for 1 ct. each. The attendants have the proceeds. After this toweling is worn out it is intended to let the attendants furnish and care for the towels and have, as now, what they make out of them, the Park Commission regulating the price charged for their use.

One closet on the men's side is reserved as a pay closet, but it does not amount to very much. In the first four months after the station was opened this closet was used but once. A charge of 5 cts. is made for the use of this closet, and this charge includes a towel. The men's side of the station is open from 7:30 in the morning to 11:30 at night, and the women's from 8 to 11. Two men and two women are employed as care takers, and the annual expense for maintenance is about $3,200.

Bids were received for building the convenience station ranging from $9,776 to $15,324; bids for plumbing, heating and marble work, from $2,997 to $3,933; and for electrical work, from $160 to $317. The totals of the actual cost were as follows:

C. E. Trumbull Co., contract for general building work	$ 9,776.00
Extras	224.38
Merrimack Supply Co., plumbing, etc., heating and marble work	2,997.00
Extras	71.73
Geo. D. Fitts, electrical work	160.00
Inspector	312.00
Water Department, piping	43.97
Blue prints	47.86
Police signal box	150.00
Incidentals	104.89
Total	$13,897.83

Personals.

Purdy & Henderson, civil engineers, have removed their engineering office from 609 Crary Building to 1142 Henry Building, Seattle, Wash.

Mr. William S. Twining has resigned his position as Chief Engineer of the Philadelphia Rapid Transit Co. and will be associated with the firm of Ford, Bacon & Davis of New York City.

Mr. Charles E. Perkins, for the past eighteen years Chief Engineer of the Public Works of the State of Ohio, has opened an office at Akron, O., where he will engage in the practice of Civil Engineering. Mr. Perkins retired from the state work on May 21.

The U. S. Civil Service Commission, Washington, D. C., will hold an examination on July 13-14, to secure eligibles from which to make certification to fill vacancies as they may occur in the Reclamation Service in the positions of assistant engineer at salaries of $1,500 per annum and upward, and junior engineer at salaries of $900 and upward.

The New York State Public Service Commission, Albany, N. Y., will hold an examination on June 25, to fill the position of civil engineer on grade crossing work with the Public Service Commission, Second District, at a salary of $2,000 to $2,400. An examination will be held at the same time to secure an Engineering Draftsman at $4 to $5 per day.

Mr. Robert H. Fuller, for the past four years Secretary to Governor Hughes of New York, has been appointed a member of the New York State Water Supply Commission, succeeding Dr. Ernst Lederle, who resigned from the commission in January to become health commissioner of New York City. Mr. Fuller before becoming Secretary to the Governor was engaged in newspaper work.

Mr. J. P. Forde, for a number of years Resident Engineer for the Canadian Pacific Ry. at Rebelstoke, B. C., has been appointed supervisor of construction of the Canadian Northern R. R. in the province, by the British Columbia government. In view of the fact that the government guaranteed the bonds of the Canadian Northern R. R. for the line that will be built in British Columbia, it is the intention, through Mr. Forde, to closely watch construction work, and it will be his duty to see that the standards of grading and tracklaying stipulated in the agreement are lived up to.

Mr. W. D. Hodge, heretofore connected with the Engineering Department of the Kansas City Southern Ry., has been appointed Chief Construction Engineer of the Denver, Laramie & Northwestern and will superintend an extension of that road into the Northwest.

The firm of Grossmann & Proskauer, Engineers, Old Colony building, Chicago, has been consolidated with the Central Engineering & Construction Co., 75 Monroe street, Chicago, and will continue to do a general engineering business under the last mentioned name.

C. D. Purdon has been appointed Chief Engineer of the Cotton Belt (St. Louis Southwestern) R. R., with headquarters in St. Louis. He succeeds M. L. Lynch, retired. Mr. W. T. Eaton, heretofore assistant Chief Engineer, has been appointed Chief Engineer for the Texas lines of the Cotton Belt, with headquarters at Tyler, Tex.

Franklin Clement Robinson, a leading chemist and health authority, died May 25 from Bright's disease at the Maine General Hospital at Portland, Me. Prof. Robinson was born at East Orrington, Me., in 1852, was graduated from Bowdoin College in 1873 and for two years studied chemistry in Harvard. He was professor of chemistry at Bowdoin and State Assayer. He was formerly president of the American Public Health Association and was an author of several standard text books.

Mr. A. W. Buel, until recently associated with Mr. Virgil G. Bogue, M. Am. Soc. C. E., of New York City, has opened offices at 15 William street, New York City, where he will engage in a civil engineering practice, making a specialty of bridges and structural work. During the greater part of the past year Mr. Buel has been absent from New York engaged in revising the design and completing plans for the two steel travelers for "Ohio River Bridge No. 1," Allegheny Co., Pa., a cantilever bridge of 750 feet span. Plans for the bridge are now completed, but Mr. Buel is still retained as consulting engineer for the contractors on erection.

John Stoughton, Erection Superintendent for the Dominion Bridge Co., of Walkerville, Ont., died May 31 at his home in Detroit, Mich., of apoplexy. He was the builder of the Victoria bridge over the St. Lawrence River at Montreal, and had supervised the erection of the majority of bridges both on this side and on the Canadian side of the water passes that separate the United States from the Dominion. Recently he returned from Victoria, B. C., where he had been planning and constructing bridge work. He was about to retire from active business, and several months ago purchased a large farm between Birmingham and Pontiac, Mich. He was 67 years of age.

Mr. Arthur E. Morgan, formerly Supervising Engineer of U. S. Drainage Investigations, and Mr. L. L. Hidinger, formerly Drainage Engineer U. S. Drainaeg Investigations, have organized the Morgan Engineering Co., of Memphis, Tenn., and will engage in the practice of hydraulic and drainage engineering with special reference to the reclamation of swamp lands. Associated with the firm are Mr. C. F. Brown, of Salt Lake City, Utah, formerly Drainage Engineer of the U. S. Drainage Investigations; Mr. Otto Kochtitzky, of Cape Girardeau, Mo., Chief Engineer of the Little River Drainage District; Mr. Gerardo Immediato, of Mont Clair, N. J., who has had charge of important hydraulic developments in Mexico and South America, and the Abbott Bros. of Ferriday, La., the latter having for the past twenty years been engaged in the development of rice lands and in the design and installation of pumping plants. The consulting staff includes Mr. S. M. Woodward, Professor of Hydraulics at the Iowa State University, formerly Supervising Engineer of the United States Drainage Investigations.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Jeffrey Conveying Machinery.—Paper, 3½x6 ins.; 24 pp. The Jeffrey Mfg. Cofifi Columbus, O.

Illustrations of conveyor belts, bucket conveyors, grab buckets and other installations by the company named.

Russell Cars.—Paper, 10¾x7¾ ins.; 8 pp. The Russell Wheel & Foundry Co., Detroit, Mich.

Illustrations and descriptions of heavy duty dump cars.

Drafting Tools.—Several folders. D. T. Kelsey, 77 Livingston St., New Haven, Conn.

Illustrates and describes several useful novel tools for the drafting room.

Antihydrine.—Paper, 6x9 ins., 4 pp., folder. The Antihydrine Co., New Haven, Conn.

A list of applications of this waterproofing material with directions for use.

Lifting Jacks.—Paper, 4⅛x9¼ ins.; 100 pp. The Joyce-Cridland Co., Dayton, O.

"Lifting Jacks" is the title of an attractive 100-page catalog just issued by this company. Besides listing their complete line of jacks for all purposes, the catalog also contains discussions of the construction and recent improvements in this line of jacks. It discusses the relative merits of various types of jacks, such as hydraulic, lever, automatic, automatic geared, screw, telescoping, etc., for different classes of service and recommends the most suitable jack for the different lines of work. The catalog contains complete information concerning the dimensions, weight, price, etc., of the various jacks, and should be on file with anyone who is interested in the purchase of jacks for any purpose.

Electric Cranes.—Paper, 12x9 ins.; 70 pp. Shaw Electric Crane Co., Muskegon, Mich.

An excellent and complete catalog which is fully illustrated with half tone engravings of different sizes and classes of electric cranes. A table of capacities and spuds of standard cranes is given.

Case Road Roller.—Paper, 9x12 ins.; 28 pp. J. I. Case Threshing Machinery Co., Racine, Wis.

A good catalog devoted to steam rollers and Troy dump wagons.

Sewage Treatment.—Paper, 5⅜x8⅞ ins.; 24 pp. Merritt & Co., Camden, N. J.

Reprint of a report by Geo. T. Hammond dealing with the features and efficiency of machinery in pumping stations connected with sewerage systems. Contains the results of investigations.

Brick and Cement Coating.—Paper, 5x7 ins.; 16 pp. Wadsworth, Howland & Co., 82 and 84 Washington St., Boston, Mass.

A booklet on the Bay State Brick and Cement Coating, a substance composed of a cement base carried in volatile oils, used both to resist dampness and as a decoration on the interior and exterior of the above named classes of walls.

Drawing Tables.—Paper, 4⅜x7¼ ins.; 8 pp. R. E. Kidder, 35 Herman St., Worcester, Mass.

An illustrated catalog on a drawing table, which has many advantageous improvements.

Centrifugal Pumps.—Paper 8¾x5¾ ins.; 40 pp. Lawrence Pump & Engine Co., Lawrence, Mass.

A complete catalog on "Vortex" Centrifugal Pump, with tables of hp. and tables of prices.

Portable Crushing Plants.—Paper, 8¼x10⅜ ins.; 16 pp. Catalog No. 66.

Sturtevant Newago.—Paper, 8¼x10⅜ ins.; 32 pp. Catalog No. 77. Stationary Screening Machinery.

Sturtevant Ring Roll.—Paper, 8¼x10⅜ ins.; 32 pp. Catalog No. 79. Grinding Machinery.

Sturtevant Crushers.—Paper, 8¼x10⅜ ins.; 28 pp. Catalog No. 62. Jaw Crushers.

Laboratory Machinery.—Paper, 8¼x10⅜ ins.; 12 pp. Catalog No. 67.

Sturtevant Rolls.—Paper, 8¼x10⅜ ins.; 22 pp. Catalog No. 65.

Emery Mills.—Paper, 8¼x10⅜ ins.; 20 pp. Catalog No. 64.

The Sturtevant Mill Co., 140 Clayton St., Boston, Mass.

The above named catalogs are from a set gotten up by the named company and each treats separately of machinery connected with the different lines of crushing and screening stone and ores.

Starrett Tools.—Paper, 5¼x7½ ins.; 232 pp.

New Starrett Tools.—Paper, 5¼x7½ ins.; 32 pp.

The L. S. Starrett Co., Atheol, Mass.

A very complete catalog with supplement on fine machine tools, measuring tools and tools for drafting. Prices are given.

Hardware.—Cloth, 7½x11 ins.; 186 pp. Wiebusch & Hilger, Ltd., 106-110 LaFayette St., New York.

A complete catalog of American and foreign hardware and cutlery.

Good Roads.—Paper, 6x9⅛ ins.; 24 pp. The American Asphaltum & Rubber Co., 600-614 Harvester Bldg., Chicago.

A description of the various products of the above company, especial reference being made to the waterproofing of macadam roads.

The government of Venezuela has entered into a contract with Dr. Ildefense Aguerreverre of Caracas to build the steel dock at Puerto Cabello. It will cost $193,000 and be completed by July 5, 1911. It must also be modern and will be divided into five sections, with a capacity of 4,000 tons. Work will begin soon.

Engineering-Contracting Monthly Review Index of Civil Engineering Literature.

A classified index and review of the civil engineering papers, articles, reports, pamphlets and books published during the month just passed is given in the succeeding pages. The literature indexed and reviewed—with the exception of books—relates solely to civil engineering. In the section devoted to Book Reviews all books in all branches of engineering are listed as received and such of them as seem worthy are reviewed as fully as due regard for conciseness will permit. In choosing books for review rigid selection is exercised. Next to careful choice of books for review timeliness of review is sought. All books are reviewed within a month of their receipt. The same statement is true of the articles and papers that are indexed. Also, as in choosing books for review, the choice of articles and papers for indexing is based on merit. Numerical strength in "titles indexed" is not sought; excellence of selection is sought.

The purposes of the Monthly Review Index are: First, to inform civil engineers and contractors of the articles and papers of merit that are published each month, in such a way as will give a clear idea of their character and scope; second, to supply the user with the date and place of publication, the length of each article and the cost at which it can be secured. The name, adopted abbreviations, place of publication and price per number of each periodical examined for civil engineering articles are given in the list immediately following. The other information is given in the index proper for each article separately.

Books reviewed will be sent post paid on receipt of price by the Book Department of ENGINEERING-CONTRACTING; periodicals, etc., containing articles indexed should be ordered direct from the publishers.

LIST OF PERIODICALS INDEXED.

American Architect (Am. Arch.), New York, N. Y.; w; 7x10 in.; 15 cts.
American Builders' Review (Am. Bldrs. Rev.), San Francisco, Cal.; m; 7x10 in.; 50 cts.
American Carpenter and Builder (Am. Car. & Bldr.), Chicago, Ill.; New York, N. Y.; m; 7x10 in., 20 cts.
American Engineer and R. R. Journal (Am. Engr. & R. R. Jl.), York, N. Y.; m; 7x10 in.; 20 cts.
American Gas Light Journal (Am. G. L. Jl.), New York, N. Y.; w; 10x13 in.; 10 cts.
American Institute of Electrical Engineers Proceedings (Am. I. of E. E. Proc.), New York, N. Y.; m; 4x7 in.; 50 cts.
American Machinist (Am. Mchst.), New York; w; 7x10 in.; 15 cts.
American Society of Civil Engineers Proceedings (Am. Soc. C. E. Proc.), New York, N. Y.; m; 4x7 in.; 75 cts.
American Society of Mechanical Engineers Journal (Am. Soc. M. E. Jl.), New York, N. Y.; m; 4x7 in., $1.
Annales des Ponts et Chaussees (An. P. & C.), Paris, France; m.
Applied Science, Toronto, Ont.; m; 6x9 in.; 20 cts.

ROAD AND STREETS.

Suggestions for a Rational Formula for Street Pavement Crowns.—Eng. News, May 5, 1910. 2⅓ pp.

Compares analytically the several formulas for pavement crowns and from the analysis works out a rational formula with empirical constants. A notably interesting article.

Up-to-date Roads.—By R. O. Wynne Roberts. Surveyor, May 13, 1910. 6 pp.

A valuable article dealing with the problems which confront the modern road engineer. A new formula for the camber of hanging roads is given and one of the theories of the transmission of pressure imposed by loaded wheels on the road surface to the subsoil is discussed. The use of bituminous binders is also dealt with and a number of simple working tests for testing tar are given.

Wood Block Creosoting.—Mun. Jl. & Eng., May 25, 1910. 1½ pp.

Gives in a handy tabular form a comparison of the specifications for creosoted wood block of 14 cities of the United States.

A Few Remarks in Regard to Surface-Spraying of Roads With Tar and Making in Situ Tar-Macadam.—B. T. Aitken. Surveyor, May 20, 1910. 1¾ pp.

A brief discussion of the main points which go to make an efficient treatment of the surfaces of road with prepared tar and tar compounds. The author also describes the methods particularly formed by him for the condition of tar macadam.

Standardization of Tar for Paving Purposes.—Eng.-Contg., May 25, 1910. 2⅔ pp.

Describes the means employed in Edinburg, Scotland, to secure a standard tar for paving processes.

Sand-Clay Road Construction in Kansas and Some Data on Its Cost.—Eng.-Contg., May 18, 1910. ¾ p.

An excellent article describing the methods to be followed in constructing sand-clay roads. Figures of costs are given.

Method of Resurfacing Worn Out Macadam Roads in New Jersey.—Eng.-Contg., May 18, 1910. ½ p.

Describes the method of resurfacing worn out macadam roads which after experiment has given the best results in New Jersey.

Road Repairs and Maintenance Work on the Metropolitan Park Commission of Massachusetts in 1909.—Eng.-Contg., May 11, 1910. ½ p.

Gives a statement of the summary of cost of road repairs and maintenance for the Metropolitan Park Commission of Mass. The costs are itemized.

Methods of Constructing Bituminous Macadam Roads to Resist the Destructive Action of Heavy Motor Traffic.—Eng.-Contg., May 11, 1910. 1¾ pp.

This article is an outline of the various methods that have been employed for constructing roads to resist heavy motor traffic. Conclusions are given summarizing the relative advantages and disadvantages of the methods described.

Methods of the New York State Commission of Highways for Testing Stone Used in Road Construction.—Eng.-Contg., May 4, 1910. ½ p.

This article describes briefly the methods employed by the above named commission for testing road stone.

Paving Roadways Having Steep Gradients.—Eng.-Contg., May 4, 1910. ¾ p.

Presents a table showing grades of various streets paved with granite blocks and gives arguments showing that this type of paving is most satisfactory for steep grades.

Experimental Concrete Road.—Cem. Era, May, 1910. ½ p.

A description of the methods and materials employed in the construction of an experimental piece of concrete road in New York State. A table of detailed costs of the construction is given.

SEWERS.

Sewage Disposal Plant at Lancaster, New York.—Eng. Rec., May 7, 1910. 1 p.

Shows general plans and describes main structural features of grit chambers, septic tank and contact beds for a filter plant for a city of 4,000.

The Disinfection of Water and Sewage.—Eng. Rec., May 14, 1910. 1¼ pp.

Discusses results obtained from chemical disinfection in a number of cities with estimates of cost of disinfection with chloride of lime. Some useful data.

Removal of Organic Matter From Sewage by Screens and Tanks.—Eng. Rec., May 21, 1910. 2 pp.

An excellent summary of practice and results in screening sewage.

Sewage Purification Results at Plainfield, N. J., 1909.—Eng. News, May 5, 1910. ½ p.

Briefly describes the plant and gives tabular summary of monthly average results of chemical and bacterial analyses of raw sewage and effluent.

Separation of Sewage Solids.—Mun. Jl. & Eng., May 25, 1910. 1 p.

Describes several methods and appliances for removing from sewage the coarser suspended matters. Several of the appliances used are new to this country. The matter is taken from a paper read before the Royal Institute of Public Health of Great Britain.

Leicester Sewage Work.—By E. George Mawbey. Surveyor, April 29, 1910. 3 pp.

A description of the sewage works of Leicester England. The system consists of classification by sedimentation tanks and single contact beds and final purification by broad irrigation on heavy clay land. The method of operation and the results obtained are given in some detail.

The Massachusetts State Board and Slate Beds.—By W. J. Dibdin. Surveyor, May 13, 1910. 2 pp.

A reply to certain statements in the "Review of 21 years experiments upon the Purification of Sewage at the Lawrence Experiment Station" at Lawrence, Mass., as to the priority of the use of superposed plates in a tank for the preliminary treatment of sewage.

Some Data on the Quantity and Cost of Bleaching Powder for Disinfecting Sewage or Effluent.—Eng.-Contg., May 11, 1910. ⅓ p.

Gives data on the amount of bleaching powder required for sewage disinfection and presents estimates of cost of operation of a plant for disinfecting sewage.

WATERWORKS AND HYDRAULICS.

Hydroelectric Plant of the Central Georgia Power Company.—Eng. Rec., May 14, 1910. 2½ pp.

General description of the 18,000 k.w. capacity plant with a head of 100 ft. The chief structural features are a concrete dam 1,070 ft. long and from 35 to 127 ft. high. Drawings of dam and power house details are given.

Deoxidizing Water to Prevent Corrosion of Steel Mains.—Eng. Rec., May 21, 1910. 1½ pp.

Describes character of corrosion of Coolgardie steel pipe line and outlines the remedial measures proposed. Plan proposed to prevent internal corrosion is to deoxidize water. Alternative plans are discussed and one plan is recommended and described. A notably interesting article.

The McCall Ferry Hydro-Electric Plant on the Susquehanna River.—Eng. Rec., May 28, 1910. 6½ pp.

An extended general description of the structures forming this 135,000 h.p. plant, with illustrations of special features of the construction plant and steel forms for concrete dam and a general outline of construction methods.

A Deep Well Sunk by Caisson.—Eng. Rec., May 28, 1910. ¾ p.

Illustrates caisson used and describes method of sinking it for a well 11 ft. in diameter and 72 ft. deep.

The Progress of the Los Angeles Aqueduct.—Eng. Rec., May 21, 1910. 3¼ pp.

General review of the work which has been done up to date on this 217-mile water supply conduit, with views along the work.

Curved Masonry Dams in New South Wales.—Eng. News, May 19, 1910. 3⅔ pp.

Describes designs of 13 curved dams of various sections with plans and tables of details and gives notes on behavior of these dams in respect to cracking and movement.

Water Filtration in Theory and Practice. By Geo. C. Whipple. Can. Engs. May 6, 1910. 8 pp.

An address given before the under-graduate society of Applied Science at McGill University.

The Western High-Service Reservoir of the Water Works at Baltimore, Md.—Eng. News, May 26, 1910. 3⅓ pp.

The reservoir has a capacity of about 210,000,000 gals. General description of structure and methods of construction with sections of embankment.

Water Softening at McKeesport.—Mun. Jl. & Eng., May 25, 1910. 1½ pp.

An abstract of a paper read before the American Water Works Association by Mr. Alexander Potter, the designing and constructing engineer for the plant. The plant has to overcome unusual hardness and acidity in the water. Some data as to the results obtained, and the amount and cost of chemicals used are given.

Concrete Pipe at Toronto.—By Francis F. Longley. Mun. Jl. & Eng., May 25, 1910. 1½ pp.

Describes the construction of 36 in. to 72 in. concrete pipe lines at the filtration plant at Toronto, Ont. The methods of handling the pipe, securing flexible water tight joints with tar and burlap, and constructing manholes are described.

The Electrically Driven Water Works Plant at Mattoon.—By H. W. Clark. Mun. Eng. Mag., June, 1910. 2 pp.

A description of the electrical installation for pumping water at Mattoon, Ill. The supply is obtained from nine 10 in. tubular wells, 65 ft. deep, and is pumped into a receiving reservoir and from there into the stand pipe and distributing systems. This is one of the few plants in this country which uses electricity for pumping water.

Experience With and Results for Municipal Water Softening.—Alexander Potter. Mun. Eng. Mag., June, 1910. 6 pp.

An interesting paper dealing mainly with the operations and results obtained at the municipal water softening plant at McKeesport, Pa.

Toronto Filtration Plant.—By Francis F. Longley. Mun. Jl. & Eng., May 18, 1910. 6 pp.

A description of the plant installed for the city of Toronto, Ont., for purifying lake water. The plant is to have a capacity of 6,000,000 gallons per day. Interesting features of the article are descriptions of the method of draining the site during construction, a novel central drain, and the sand handling equipment. Drawings showing details of sand workers and sand bins are given.

The Los Angeles Aqueduct.—By Edward P. Bailey. Mun. Jl. & Eng., May 11, 1910. 4 pp.

General descriptive article on the equipment now under construction to supply the city of Los Angeles with water from the Owen river. A number of illustrations are given of typical features of this work.

Equipment and Cost of a Fire Service Water Supply System at Winnipeg, Manitoba.—Eng.-Contg., May 25, 1910. 1 p.

Describes the construction of a fire service pumping plant and distributing mains and gives general itemized costs of the system.

Method and Cost of Constructing a Water Supply Tunnel Through Rock by Day Labor With Costs of Supplementary Structures.—Eng. Contg., May 25, 1910. 6⅓ pp.

Describes the method of constructing a tunnel nearly 5,000 ft. long for water supply, gives details as to power and plant employed, and complete costs of excavating the tunnel.

Method and Cost of Constructing Two 18-in. Cast Iron Water Mains by Day Labor for the Fort William, Ontario, Water Supply.—Eng.-Contg., May 18, 1910. ⅔ p.

Gives itemized cost of constructing 10,200 ft. of supply main and some 12,000 ft. of pressure main, both of cast iron pipe 18 in. in diameter.

Day Labor vs. Contract Work on the Los Angeles Aqueduct.—Eng.-Contg., May 18, 1910. 1¼ pp.

This is an article by the assistant chief engineer of the work named, comparing the cost of day labor work with the bidding prices received from contractors for the same work.

Experience With and Results From Municipal Water Softening.—Eng.-Contg., May 11, 1910. 2 pp.

Describes the water purification and softening plant at Keysport, Pa. Results obtained are given and a tabular statement is presented showing the character of water treated, amount of chemicals used, and cost of treatment.

The Los Angeles Aqueduct: Structural Details, Economic Studies, Working Organization and Service Constructions.—Eng.-Contg., May 4, 1910. 4½ pp.

This article outlines the main structural features of the Los Angeles Aqueduct; describes the working organization and the various service lines and plants constructed for the work.

Keokuk Hydroelectric Plant.—Elec. Wld., May 19, 1910. 2 pp.

A description of the power plant and dam now under construction on the Mississippi River 140 miles above St. Louis.

Rebuilding Dam at Hauser Lake, Mont.—Contr., May 1, 1910. 4¼ pp.

A description of the construction of a dam across the Missouri River in Montana which is to replace a dam which was washed away two years ago.

Some Extracts From and Notes Upon a Recent Report on the Purification of the Water Supply of Sacramento. Can. Engr. May 27, 1910. 1½ pp.

A short summary of the report of Prof. Hyde in favor of treating the water of the Sacramento River by sulphate of alumina coagulation, rapid mechanical filtration, and disinfection by the use of calcium hypochlorite.

DRAINAGE AND IRRIGATION.

Field Work in Locating Irrigation Ditch and Canal Lines.—Eng. News, May 26, 1910. ¾ p.

Outlines sequence of operations and methods of making locating surveys for ditch lines.

Some Experiments on the Durability of Cement Drain Tile.—By Prof. W. H. Day. Mun. Eng. Mag., June, 1910. 2 pp.

A description of tests conducted at the Agricultural College at Guelph, Ont., regarding the solubility of cement and the probable durability of cement drain tile.

Method of Lining an Irrigation Canal With Cement Plaster, With a Discussion on Cement Plaster Versus Lime and Cement Plaster.—Eng.-Contg., May 18, 1910. 1½ pp.

This article describes the method of lining an irrigation canal by plastering it with cement mortar. A discussion is presented of the relative advantages of cement mortar and of cement and lime mortar for the purpose named.

Method and Cost of Lining Earthen Channel With Concrete.—Eng.-Contg., May 4, 1910. ⅔ p.

Illustrates section of lining of covered channel for the Los Angeles Aqueduct. Describes the method of construction and gives complete unit costs. Illustrations of the form and of the method of handling it are shown.

Laying 12 Miles of Pipe in Colorado.—Cem. Era, May, 1910. 3 pp.

Showing the method of building concrete pipe lines in a rough mountainous country.

Absorption Tests of Drain Tile.—Con. Rec., May, 1910. 1½ pp.

Giving a description of the methods of the tests and a table showing the results. Tests were made on cement tile and on clay tile.

RIVERS, HARBORS AND CANALS.

Construction of the New York State Barge Canal Through Little Falls.—Eng. Rec., May 7, 1910. 5⅓ pp.

A general descriptive article on the special prism and lock work at the city named where a change in level of 40 ft. occurs. Plans of locks are features of most value.

The North Shore Channel of the Sanitary District of Chicago.—Eng. Rec., May 14, 1910. 4½ pp.

A good general description of the route, channel section and structural features of this branch of the Chicago Drainage Canal which is now under construction. General methods of excavation are outlined and maps and views of the work given.

The Scoop-Wheel Pumping Plant at Schellingwoude, Holland.—Eng. News, May 19, 1910. 3 pp.

Describes and illustrates pumping plant consisting of 6 scoop wheels 27 ft. in diameter with test data.

The Problems of Winter Navigation on the St. Lawrence River. By H. T. Barnes. Can. Engr. May 13, 1910. 2 pp.

An illustrated article showing the difficulties and methods of overcoming them, of navigating the St. Lawrence in winter.

Preparing Foundation for a Big Dam. Contr May 15, 1910. 2 pp.

A description of the contractors' work on the Missouri river near Helena, Mont.

The Behavior of a Stream Carrying Sand and the Effect of Sand on the Measurement of Bottom Velocity.—Eng. News, May 19, 1910. 1⅓ pp.

A discussion of the effect on velocity and profile of water surface of loading a stream with sand.

Some Notes on Sliding Sluice-Gates, Charles River Basin, Boston-Cambridge, Mass.—Eng. News, May 26, 1910. 1⅓ pp.

Describes the sluice gate construction at the work named with special description and illustration of grease cup for lubricating screw stems. Results of tests are given of co-efficient of friction between sluice gates and frame.

Condensed Facts on the Panama Canal.—Eng.-Contg., May 18, 1910. 1⅔ pp.

This article assembles the various facts and statistics regarding the Panama Canal. Tables of excavation, of expenditures and of equipment are given.

Method of Stream Gaging by Use of Rod Floats With an Outline of the Reductions.—Era, May, 1910. 3½ pp.

A very plain and simple discription of the procedure to be followed in gaging streams by the use of rod floats. The method of making the reductions from the observations is explained fully.

How a Pier Was Built and Its Cost.—Cem. Era, May, 1910. 2¼ pp.

This article gives construction details of a pier constructed at Bocas del Toro, Panama, for the United Fruit Co.

RAILWAYS

The Waterproofing of Extensive Railroad Bridge Floors.—Eng. Rec., May 14, 1910. 1¼ pp.

Describes general construction of bridges crossing streets for new Chicago terminal of C. & N. W. Ry., and gives details of concrete floor construction and of water proofing.

New Union Passenger Station, Winnipeg.—Eng. Rec., May 21, 1910. 2⅔ pp.

Describes and illustrates steel work of a 140x350 ft., four story building with a dome 90 ft. in diameter, rising 100 ft. above the ground.

Valuation of the Puget Sound Electric Railway.—Eng.-Contg., May 25, 1910. 4⅓ pp.

Describes the methods employed in making the valuation of the railway named and gives tables showing the costs of reproducing the line new, the depreciated value of the road, and the cost of reproduction new per mile of track grading.

Cost of Operating the New York City Railway Co. Lines—218 Miles of Electric Street Railways.—Eng.-Contg., May 4, 1910. 1½ pp.

Gives complete statistics of the operating costs of the railway named.

Keeping Records of Test Ties.—By F. J Angier. R. R. Age-Gaz., May 6, 1910. 1½ pp

A paper showing the method adopted by the Burlington Railway in obtaining accurate records of the life of ties.

The Necessity of Depreciation Reserves.—By Henry L. Gray. R. R. Age-Gaz., May 27, 1910. 2 pp.

A discussion of principles relating to maintenance and depreciation of railway properties showing the difference between the maintenance and depreciation accounts and giving tables of the percentage of annual depreciation of various items in railway properties.

The New Station and Tunnels of the Pennsylvania R. R. in New York.—Cem. Age, May, 1910. 13 pp.

A description of the station and tunnels and the methods of construction of the tunnels.

Car Repair Shop Notes From the Erie Railroad at Buffalo. R. R. Age Gaz. May 6, 1910. 8 pp.

With many illustrations showing the methods and machinery used in car repairing. The particular feature is the use of the oxy-acetylene apparatus for cutting steel and rivet heads.

Grade Separation. By W. H. Breithaupe Can Engr. May 13, 1910. 2 pp.

An article devoted to the elimination of grade crossings. The article aims to give existing conditions governing the practicability of separating the grades.

Important Books For Railway Engineers

Railway Track and Track Work

By E. E. RUSSELL TRATMAN,

Mem. Am. Soc. C. E., Mem. Am. Ry. Eng. M.-of-Way Assoc., Associate Editor of "Engineering News." Third Edition (revised and enlarged). Cloth; 6 × 9 inches; 520 pages; 232 Illustrations, 44 Tables and an Appendix of Standard Track Construction on American Railways.

Price, $3.50 net.

The Railway Transition Spiral

By PROF. ARTHUR N. TALBOT,

Mem. Am. Soc. C. E., Professor of Municipal and Sanitary Engineering, University of Illinois. Fifth Edition (revised). Flexible leather; 4 × 6¾ inches; 102 + vi pages; 17 pages of tables.

Price, $1.50 net.

The Six-Chord Spiral

By J. R. STEPHENS, C. E.

5 × 7½ inches; 76 pages, 6 figures, 8 tables.

Price, *Boards, $1.00* / *Cloth, $1.25* ***Net.***

Field Practice of Railway Location

2nd Edition Revised

By WILLARD BEAHAN, B. C. E.

Cloth; 6 × 9 inches; 254 + x pages; 43 illustrations and 7 folding plates.

Price, $3 net.

Economic Theory of Railway Location

By the late A. M. WELLINGTON, C. E.

Sixth Edition (1906). Cloth; 6 × 8½ inches; 980 + xx pages; 313 illustrations.

Price, $5 net.

Railway Right-of-Way Surveying

By ALBERT I. FRYE,

Mem. Am. Soc. C. E. Cloth; 6 × 9 inches; 50 pages.

Price, $1 net.

Rules for Railway Location and Construction of the Northern Pacific Railway Company

By E. H. McHENRY,

Mem. Am. Soc. C. E., Chief Engineer No. Pac. Ry. Co. (1895-1901), now Vice-President N. Y., N. H. & H. R. R. Cloth; 4½ × 7½ inches; 88 pages; 2 folding plates.

Price, $1 net.

Railroad Curve Tables

By R. S. HENDERSON.

5 × 7 inches; 69 pages; 10 diagrams.

Price, *Cloth, $1.00* / *Leather, $1.50* ***Net.***

Send for complete circulars of above and other technical books

Engineering News Book Dept.
220 Broadway New York

Equipment Depreciation and Displacement. By William Mahl R. R. Age Gaz. May 20, 1910. 1 p.

An article with tables showing the percentage of depreciation, and renewals of railway equipment on different lines for past three years.

Heavy Work on Pennsylvania Lines. By Geo. D. Steel Contr. May 15, 1910. 4 pp.

A description of several pieces of construction work between Pittsburg and New York City.

BRIDGES, BUILDINGS AND FOUNDATIONS.

Boylston Street Bridge Renewal Erection.—Eng. Rec., May 7, 1910. 1¾ pp.

Describes methods employed in reconstructing a 216-ft. span bridge for heavier traffic. Some unusual construction problems were encountered.

New Buildings of the Jones & Laughlin Number 14 Mill. Eng. Rec., May 14, 1910. 4¾ pp.

General description of steel work for a rolling mill building 489x133 ft. The drawings illustrating general and special details are the valuable features.

Underpinning a 300-Ton Column on Quicksand.—Eng. Rec., May 14, 1910. ¾ p.

Illustrates and describes briefly the procedure employed to underpin a heavily loaded building column.

The Bryant Building Substructure.—Eng. Rec., May 21, 1910. 3 pp.

General description of caisson foundations for a 31 story, 58x82 ft. building, and of methods of construction. Chiefly interesting for showing bracing of foundation pit.

Determined of Wind Stresses in Three-Hinged Arches.—Eng. Rec., May 21, 1910. 2½ pp.

Outlines methods employed in computing the wind stresses in a three-hinged arch carrying a 10 ft. steel pipe line across a canyon. Outline drawings of steel work and stress diagrams are shown. A suggestive article.

Shoring Channel Span, South 22d Street Bridge, Pittsburg.—Eng. Rec., May 28, 1910. 3¼ pp.

Interesting description of the methods employed to support a 520 ft. center span and the ends of two 260 ft. side spans while rebuilding three river piers. Drawings are given of the falsework and special appliances employed.

Reconstruction of Part of the Manhattan Elevated Railway.—Eng. Rec., May 28, 1910. 2½ pp.

Describes method of depressing some 600 ft. of double track elevated railway passing under a bridge approach. Detail drawings of the new elevated structure are given.

Framework of New 22d Regiment Armory, New York City; a Three-Hinged Arch Roof With Cantilever Skewback Supports.—Eng. News, May 5, 1910. 2⅔ pp.

Three hinged arch roof trusses of 134 ft. span truss and hinged supports at the extremities of cantilever arms extending inward 20¼ ft. from opposite wall columns at a height of 33 ft. above the floor. General plans of the framework and details of a roof truss and of a column and its cantilever arm are illustrated and described.

Substructure of Cantilever Bridge Over the Ohio River at Beaver, Pa., Pittsburg & Lake Erie R. R.—Eng. News, May 5, 1910. 3 pp.

The bridge is a cantilever with a 769-ft. channel span and two 320-ft. end spans and one 370-ft. approach span. Drawings of abutments and piers are given and methods of constructing them are described. A good descriptive article.

An 1,800-ft. Steel Arch as a Quebec Bridge Project.—Eng. News, May 19, 1910. 1⅔ pp.

Shows general elevation and section and erection diagram for a 3,178-ft. steel arch span with notes on essential features of the project.

Some Formulas for Statically Indeterminate Members and Frames.—Eng. News, May 26, 1910. 2¼ pp.

Presents formulas to be used in analyses of moment stresses in single numbers or in rigid framed bents, due to eccentric loading or to the rigid framing, in statically indeterminate cases.

A Method of Sinking Curbed Foundation Wells Using Shields and Compressed Air With Some Notes on Chicago "Caisson" Foundations.—Eng.-Contr. May 11, 1910. 1¾ pp.

A well written general article describing the

"Text Book on Graphic Statics"

By C. W. MALCOLM,

Assoc. M. Am. Soc. C. E., Assistant Prof. Structural Engineering, University of Illinois.

This text was prepared for the author's students in elementary Graphic Statics and Stresses. It has not been the object of the writer to discover new principles, but rather to present the subject clearly and logically. Many texts on Graphic Statics are open to the criticism that they have a tendency to state principles and give constructions without proofs, and the student is therefore compelled to memorize propositions and constructions without being taught the underlying principles. It has been the aim of the writer to give the proofs, together with full explanations of the constructions. No attempt has been made to give elaborate solutions which have little or no practical applications. Particular attention has been given to the order of presentation; and the text has been divided into chapters, articles and numbered sections to facilitate easy reference.

CONTENTS:

PART I—GENERAL PRINCIPLES.

CHAPTER I.—DEFINITIONS.
CHAPTER II.—CONCURRENT FORCES.
CHAPTER III.—NON-CONCURRENT FORCES.
CHAPTER IV.—MOMENTS.
CHAPTER V.—CENTER OF GRAVITY OF AREAS.
CHAPTER VI.—MOMENT OF INERTIA.

PART II—FRAMED STRUCTURES—ROOF TRUSSES.

CHAPTER VII.—DEFINITIONS.
CHAPTER VIII.—LOADS.
CHAPTER IX.—REACTIONS.
CHAPTER X.—STRESSES IN ROOF TRUSSES.
CHAPTER XI.—WIND LOAD STRESSES.
CHAPTER XII.—STRESSES IN CANTILEVER AND UNSYMMETRICAL TRUSSES—MAXIMUM STRESSES.
CHAPTER XIII.—COUNTERBRACING.
CHAPTER XIV.—THREE-HINGED ARCH.
CHAPTER XV.—STRESSES IN A TRANSVERSE BENT OF A BUILDING.
CHAPTER XVI.—MISCELLANEOUS PROBLEMS.

PART III—BEAMS.

CHAPTER XVII.—BENDING MOMENTS, SHEARS, AND DEFLECTIONS IN BEAMS FOR FIXED LOADS.
CHAPTER XVIII. MAXIMUM BENDING MOMENTS AND SHEARS IN BEAMS FOR MOVING LOADS.

PART IV—BRIDGES.

CHAPTER XIX.—TYPES OF BRIDGE TRUSSES.
CHAPTER XX.—LOADS.
CHAPTER XXI.—STRESSES IN TRUSSES DUE TO UNIFORM LOADS.
CHAPTER XXII.—INFLUENCE DIAGRAMS AND POSITIONS OF ENGINE AND TRAIN LOADS FOR MAXIMUM MOMENTS, SHEARS, AND STRESSES.
CHAPTER XXIII.—MAXIMUM MOMENTS, SHEARS, AND STRESSES DUE TO ENGINE AND TRAIN LOADS.

Cloth, 6x9 inches, 316 pages, 155 drawings, $3.00 net, postpaid.

The Myron C. Clark Publishing Company

13-21 Park Row, NEW YORK 355 Dearborn Street, CHICAGO, ILL.

Tables for Structural Engineers

By EDWARD GODFREY

The author of this book has been engaged for the past 15 years as draftsman, inspector and engineer, having been in the employ of G. W. G. Ferris & Co., and Hallsted & McNaugher from 1890 until 1899, and from 1899 engaged as engineer with their successors, Robert W. Hunt & Co. For two years of this time he was instructor in engineering at the Western University of Pennsylvania. This book and others which he has in preparation, have grown out of an experience well suited to make them useful in the branches which the title suggests.

THE CONTENTS INCLUDE:

Shearing and Bearing Value of Rivets; Bending Moments of Pins; Areas and Weights of Angles; Properties of I-Beams, Channels, Angles, Z-Bars and T-Shapes; Weights and Dimensions of Standard Rail Sections; Dimensions of Standard Pipe, Eye Bars, Clevises, Sleeve Nuts and Turn Buckles; Carnegie Standard Beam and Channel Framing; Bending Moments of Beams and Girders; Moments of Inertia, Weights and Areas of Flat-rolled Steel; Weights and Areas of Square and Round Bars; Calculations for Batter Posts, Hip and Valley Rafters; Skew Portals; Stresses in Roof Trusses; Tables for Cooper, E50, Loading, for Built Girders and Various Built Sections; Typical Details for Footings, Floors, Gutters, Roofs, Trusses, Arches, Chimneys; as well as the mathematical Tables, Tables of Squares and Roots, etc., most commonly used.

Flexible leather; 4x6½ inches; 218 pages; price $2.50 net, postpaid.

The Myron C. Clark Publishing Company

13-21 Park Row, NEW YORK 355 Dearborn St., CHICAGO, ILL.

caisson method of foundation construction commonly employed in Chicago. Particular description is given of the novel method of sinking curbed foundation wells using a shield and compressed air.

Surmounting Many Difficulties on a Bridge Pier. Contr. May 15, 1910. 3 pp.

An account of the experiences of a contracting firm in the construction of a bridge pier in Montana, relating to difficulties encountered during winter ice jams and floods and the methods of adjusting themselves to the conditions.

Method of Constructing Coke Oven Foundations. Contr. May 15, 1910. 4 pp.

A description of the construction of the foundations of the plant of the Indiana Steel Company at Gary, Ind.

CONCRETE AND REINFORCED CONCRETE.

Forms for a Concrete Water Tank.—Eng. Rec., May 7, 1910. ⅓ p.

Illustrates and describes standard forms for circular locomotive supply water tanks.

Concrete Poles for Transmission Line.—Eng. Rec., May 21, 1910. 1⅔ pp.

Describes method of molding and erecting reinforced concrete poles for a transmission line. Forms are illustrated. Erection accomplished by means of derrick barges, the line being along the edge of the Illinois & Michigan Canal.

Putting a Concrete Jacket on a Cracked Chimney. Can. Engr. May 13, 1910. 1½ pp.

A description of the method of the construction of a concrete jacket around an old and poorly constructed chimney at New Haven, Conn. With drawings.

A Reinforced Concrete Dock.—Eng. Rec., May 21, 1910. 1⅓ pp.

Illustrates details and describes construction of steel and girder pin of heavy construction. An interesting example of reinforced concrete work.

Action of Sea Water on Portland Cement.—Eng. Rec., May 21, 1910. 1¼ pp.

Describes tests made to determine selection of cement for sea water construction. A useful study.

Tests of Concrete for Impermeability.—Eng. Rec., May 28, 1910. ⅔ p.

Gives results of a series of tests made with various concrete mixtures and water proofing compounds to secure an impermeable concrete for sewer construction.

A Method of Design of a Reinforced Concrete Siphon.—Eng. Rec., May 28, 1910. 5⅔ pp.

Describes in detail successive steps in designing a large reinforced concrete siphon. A notably valuable article.

The Analytic Calculation of a Concrete Arch.—Eng. News, May 12, 1910. 3⅓ pp.

Takes up in detail the necessary steps in designing an arch rib or ring of reinforced concrete according to the electric theory and the unit land method.

Effect of Sewage and Sewage Gases on Concrete.—By Sydney H. Chambers. Surveyor, April 27, 1910. 2 pp. Mun. Eng. Mag., June, 1910. 3 pp.

An abstract of a paper read before the Concrete Institute of Great Britain. Investigations were conducted by the author to determine the effect of sewage and sewage gases on concrete, and the conclusion was reached that the gases in solution in sewage and those expelled from its decomposition do under certain conditions act injuriously upon Portland cement concrete. The conditions under which this action takes place were found to be as follows: (1) When a high degree of putrescence of the sewage prevails; (2) in a moistened surface, which held or absorbed the putrid gases; (3) in the preserves of a free air supply. The discussion of the paper is given in The Surveyor of May 6, 1910.

Plant Cost of Machine Mixed Concrete.—Eng.-Contg., May 25, 1910. ⅓ p.

Gives three tables showing the comparative economy of owning and renting concrete mixing plants. These data are of particular interest to contractors.

Some Notes on the Effect of Sewage and Sewage Gases on Portland Cement Concrete.—Eng.-Contg., May 25, 1910. 1⅓ pp.

An interesting article giving results of investigations made to determine the effect of sewage and sewage gases on concrete walls and roof of tanks employed in sewage purification works.

Cost of the Concrete Balcony Floors of the Lockport Power House, Chicago Drainage Canal.—Eng.-Contg., May 25, 1910. 1½ pp.

Describes the method of constructing a balcony floor of concrete arches supported by I-beams and gives complete itemized cost of the work.

Method of Constructing Concrete Slope Paving Under Water Lachine Canal, Canada.—Eng.-Contg., May 18, 1910. 1¼ pp.

An excellent article illustrating and describing the forms and plant employed in constructing concrete slope wall under water in lining a canal. The working force employed and the quantities of work done are stated in detail.

Some Notes on Methods of Constructing Concrete Lined Shafts.—Eng.-Contg., May 18, 1910. 2½ pp.

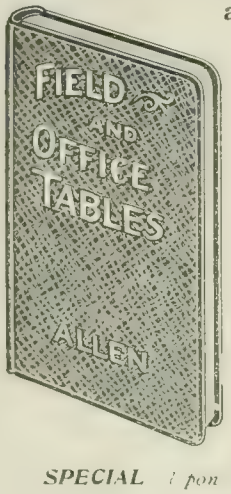
Describes and illustrates methods employed in sinking four different concrete lined mining shafts. Special details are given of the seals employed at the joint between the concrete lining and the ledge rock.

Method and Cost of Placing Concrete Lining Inside Iron Lining of River Section of Pennsylvania Railroad, North River Tunnels, New York City.—Eng.-Contg., May 11, 1910. 4⅔ pp.

Describes the methods and apparatus employed in lining the Twin Tube tunnels under the

ALLEN'S FIELD and OFFICE TABLES

give the Progressive Engineer just the information he wants, at the time he wants it most.



Is compact, concise, complete and the quickest, handiest time and brain-saving reference book on the market. Made for the pocket and weighs only 7 ounces. Price $2.00.

CONTENTS:

Radii and their Logarithms.
Tangent Offsets and Middle Ordinates
Tangent Distances for 1° Curves.
Corrections for Tangent Distances.
External Distances for a 1° Curve.
Offsets from Tangent for a 1° Curve
Angles Proportional to Squares of Distances.
Long Chords and Actual Arcs.
Acres for Strip 100 feet wide.
Curves for Metric System. Barometric Heights
Logarithms of Numbers.
Logarithmic Sines, Cosines, Tangents and Cotangents
Auxiliary Tables for Logarithmic Sines and Tangents of Small Angles.
Logarithmic Versed Sines and External Secants.
Auxiliary Versed Sines and External Secants of Small Angles.
Cubic Spiral Easement Curves; Numbers and Formulas
Natural Sines and Cosines
Natural Tangents and Cotangents.
Natural Versed Sines and External Secants.
Length of Circular Arcs; Radius—1.
Squares, Cubes, Square Roots, Cube Roots and Reciprocals
Turnouts and Switches, Velocity Heights.
Rise per Mile of Various Grades
Elevation of Outer Rail on Curves
Inches in Decimals of a Foot
Middle Ordinates for Curving Rails
Stadia Reductions, Horizontal and Vertical.
Mean Refractions in Declination.
Triangular Prisms; Cubic Yards per 50 Feet.
Prismoidal Correction; Cubic Yards per 100 Feet.
Explanation of Tables; List of Tables.

298 pages, 6¼×4¼ inches; Limp Leather.

SPECIAL OFFER *Upon receipt of $2 for a copy, we will stamp YOUR NAME IN GOLD ON COVER, free of charge, and mail book to you postpaid*

FINANCING AN ENTERPRISE

Practical two vol. work by Francis Cooper telling how to secure capital and successfully promote a business enterprise. Prospectus writing, patents, capitalization, incorporation. Written from 15 years' promoting experience. Third ed. 543 pp. $4 prepaid. Circular on request. Ronald Press Co., 229X Broadway New York

Tables for Calculating Sizes of Steam Pipes

Bound in Cloth; 4½x6½ in.; 47 pp. Postpaid, $2.00

Table for Losses of Pressure for the Different Coefficients of Friction

50 Cents Postpaid

By ISAAC CHAIMOVITSCH, M. E.

Room 50, 240 La Salle Street, CHICAGO

REID'S

"Concrete and Reinforced Concrete Construction" is the world's authority on this important subject. 906 pp.; 715 illustrations; 70 tables. $5.00 net; 16-page circular free.

The Determination of Ordinary High Water Plane on the Pacific Coast of the United States—A Discussion

By D. E. HUGHES and OTTO VON GELDERN, Technical Society of the Pacific Coast

Public Sanitary Station at Brookline

By ALEXIS H. FRENCH, Boston Society of Civil Engineers

Public Sanitary Station at Lawrence—With Discussion

By ARTHUR D. MARBLE, Boston Society of Civil Engineers

The Economy Resulting from the Use of the Level on the Farm

By GEORGE M. LEWIS, Montana Society of Engineers

Paint for Iron and Steel

By FRANK NEAL, Detroit Engineering Society

Journal of the Association of Engineering Societies, April, 1910

30 Cents Per Copy. $3.00 Per Annum.

FRED. BROOKS, Secretary, 31 Milk Street, BOSTON, MASS.

Hudson River, New York City. Tables are given showing the average time taken for various operations and typical working gangs and wages paid them.

Method and Cost of Constructing Concrete Lining for the Land Sections of the Hudson River Tunnels of the Pennsylvania Railroad.—Eng.-Contg., May 4, 1910. 2⅔ pp.

This article describes in sequence the operations employed in lining the Twin tunnels named; itemized costs are given of concrete lining, brick work, water proofing and grouting.

An Example of Rapid Work in the Construction of a Large Reinforced Concrete Building.—Cem. Rec., May, 1910. 2⅛ pp.

A description of the construction of a concrete storage building covering about 25,000 sq. ft. and being 4 stories high.

Causes of Concrete Bridge Failures.—Concrete, May, 1910. 6 pp.

An analysis of 11 different cases of failure, or partial failure, of concrete in bridges and abutments.

The Effects of Sewage and Sewage Gases on Portland Cement Concrete.—By Sidney H. Chambers. Conc. and Cons. Eng., May, 1910. 9 pp.

A summary together with the discussion which followed the reading of the paper before the Royal United Service Institution.

Action of Alkali on Portland Cement.—Conc. Eng., May, 1910. 2 pp.

A description of some tests and some examples of the failure of Portland cement due to alkali.

Model Plant on Los Angeles Bridge.—Contr., May 1, 1910. 2½ pp.

A description of the work on a concrete viaduct in the city of Los Angeles, Cal., with especial reference to the plant employed by the contractor.

Novel French System of Reinforced Concrete Pile Construction.—Cem. Wld., May, 1910. 2½ pp.

Being a short illustrated description of a rectangular concrete pile designed by Emil Villet.

EARTH AND ROCK EXCAVATION.

An Austrian Drill Boat With Screw-Operated Spuds.—Eng. News, May 26, 1910. ⅔ p.

General description of boat with illustration and particular description of screw operated spuds.

Cost of Crushing Stone for Concrete Lining of Pennsylvania Railroad North River Tunnels.—Eng.-Contg., May 18, 1910. ⅓ p.

Describes the crushing plant employed and gives the itemized costs of crushing stone for concrete for tunnel lining.

Method of Constructing Shield Driven Cast Iron Lined Tunnels Under the North River With Itemized Records of Labor Force, Wages and Time of Various Operations.—Eng.-Contg., May 18, 1910. 6½ pp.

A notably complete article describing in great detail the method driving by shield the tunnels under the Hudson River for the Pennsylvania Railroad. The gangs required for the various operations are given together with the wages paid the different men. Tables of the quantities of the work, of monthly progress and of the time required for the various operations, are presented. These are the most complete data on shield tunnel work ever published.

A Central-Control, Electrically-Operated Car Haulage for Canal Work With Some General Costs.—Eng.-Contg., May 18, 1910. ⅔ p.

A brief description of the method of hauling spoil in constructing the North Shore Channel of the Chicago Drainage Canal. A centrally-controlled, electrically-operated car haulage system is employed.

Method and Cost of Excavating Land Sections of Pennsylvania R. R. North River Tunnels at New York City.—Eng.-Contg., May 11, 1910. 5⅓ pp.

This article describes in great detail the methods employed in excavating the rock tunnels named. Data are given regarding drill operation, costs of timbering and costs of excavation.

NOW READY! NOW READY!

Second Edition

of

Gillette's "Cost Data"

(1900 pages)

The second, or 1910, edition of Gillette's "Handbook of Cost Data" is now off the press. This edition contains 4½ times as much data as the first edition contained. A slightly smaller size of type and a slightly larger type page have been used in this second edition, so that one page of the second edition is equivalent to one and a half pages of the first edition. This, taken with the very great increase in the number of pages, makes the 1910 edition of Gillette's "Handbook" the largest technical "pocketbook" published in America. As a reference book on *methods* of construction of all classes of engineering works, it merits a place in every engineer's or contractor's library. As a reference book on detailed *costs* it is obviously invaluable. The unprecedented sale of the first edition clearly demonstrated that fact.

That the owners of copies of the first edition may clearly appreciate the very great increase in the amount of data in the second edition, we give the following table:

		Pages.
I	Principles of Engineering Economics	118
II	Earth Excavation	52
III	Rock Excavation	87
IV	Roads and Streets	217
V	Stone Masonry	55
VI	Concrete	110
VII	Waterworks	161
VIII	Sewers	143
IX	Timberwork	124
X	Buildings	54
XI	Railways (Steam and Electric)	348
XII	Bridges	246
XIII	Steel Work (Not given in other sections)	29
XIV	Engineering and Surveys	34
XV	Miscellaneous Cost Data.	63
	Total Text	1,841

This is exclusive of tables of contents and index, which bring the grand total up to nearly 1,900 pages. Remember that this is equivalent to 2,800 pages of the size used in the first edition, and you will better appreciate the truly enormous increase in amount of cost data.

The Price of the Book is $5.00 net, postpaid

The Myron C. Clark Publishing Co.

355 Dearborn Street, CHICAGO 13-21 Park Row, NEW YORK

Practical Cement Testing

By W. PURVES TAYLOR, M. S. C. E.
Engineer in Charge of Philadelphia Municipal Testing Laboratories.

THIS is the first practical and exhaustive treatise on this important subject. It has already been adopted as a text book by leading technical schools.

Each chapter contains a minute description of the methods followed in the author's laboratory and many valuable suggestions as to the "how" and "why" of cement testing. The observations on the interpretation of results, one of the most difficult tasks of the novice, are especially pertinent and are expressed in a fair and conservative manner.

The book is so complete that it can be put in the hands of a young engineer with confidence that it will enable him to make reliable tests on cement. The wealth of photographs and line cuts furnish the pictorial examples of how to conduct cement tests and the 300 pages of texts are so explicit that even the most inexperienced man can soon learn the art of cement testing. Yet the book has not a superfluous paragraph.

Cloth, 6x9 inches; 330 pages; 142 illustrations; 58 tables; $3.00 net, postpaid.

HEIDENREICH'S "POCKETBOOK"

The large sale of this Pocketbook for designers of reinforced concrete demonstrates again the fact that the true merit of any book soon becomes generally known. As a labor saver Heidenreich's Pocketbook is directly comparable with the best pocketbooks on structural steel work. Its tables are very complete. The book is leather bound, 374 pages, and its price is $3.00 net, postpaid.

Methods and Costs of Operating Well Drilling Machines in Prospecting for Copper.—Eng.-Contg., May 4, 1910. 1⅔ pp.

This article describes the method of handling well-drilling outfits, gives numerous hints regarding the repair and maintenance of such outfits and presents tables showing time required for various operations and giving itemized costs of drilling.

A New Type of Steam Shovel.—By Otto Ruhl. Min. Wld., May 21, 1910. ⅔ p.

A short illustrated description of an entirely new type of shovel built especially for mining work. It is of small size, weighing 2½ tons and takes the place of from 5 to 8 shovelers.

The Use of Explosives in Heavy Work.—By C. E. Breguyer. Contr., May 1, 1910.

Giving some valuable information for shaft, tunnel and quarry blasting with methods of handling explosives to get the best results.

SURVEYING AND DRAFTING.

Results of Tests of Simple and Inexpensive Surveying Instruments.—Eng.-Contg., May 11, 1910. 1½ pp.

An interesting paper giving the results of tests made to determine the accuracy of various simple surveying instruments commonly used.

Some Costs of Stadia Surveys for the New York State Water Supply Commission.—Eng.-Contg., May 4, 1910. ½ p.

Describes the methods of making two stadia surveys and gives itemized cost of each.

MISCELLANEOUS.

A Large Sand and Gravel Washing Plant.—Eng. Rec., May 7, 1910. ⅔ p.

Illustrates layout and describes general structural features of a 700 cu. yd. per day capacity gravel washing plant.

Reinforced Concrete Barges on the Pacific Division of the Panama Canal.—Eng. Rec., May 28, 1910. 2½ pp.

Gives complete general plans for reinforced concrete barge 24x64 ft. to carry centrifugal pumps. The construction is described and data on live and dead loads given. A good article.

The New Timber Treating Plant of the Eppinger & Russell Co. at Jacksonville, Fla.—Eng. News, May 12, 1910. 2½ pp.

Shows layout and describes various structural units and operating features of a plant having a yearly capacity of 2,000,000 ties and 10,000,000 ft. B. M. of lumber.

Washington Street Market, Newark, N. J.—Mun. Jl. & Eng., May 25, 1910. 2 pp.

General article describing a public market at Newark, N. J. A feature of the market is that the show cases as well as the refrigerators are cooled by ammonia refrigerating machine.

Town Scavenging and Refuse Disposal.—By Hugh S. Watson. Mun. Eng. Mag., June, 1910. 3 pp.

Describes the methods employed in a number of English cities for the utilization of heat from refuse destruction. In many of the cities the steam generated by destructors is used for pumping water in sewage or for electric lighting or traction.

Depreciation and Reserve Funds of Electrical Properties.—Eng.-Contg., May 25, 1910. 2¼ pp.

A general discussion of the subject named in the title.

First Cost and Cost of Operating Power Plants for Driving North River Tunnels of Pennsylvania Railroad, New York City.—Eng.-Contg., May 25, 1910. ⅓ p.

Gives the first cost of the power plant used in the tunnels named and also the cost of operating one power house for twenty-four hours. Some notably interesting figures on power plant costs for contract work.

A Rational Method of Determining Reasonableness of Rates Charged by Public Service Corporations and a Discussion of the Theory of Profits.—Eng.-Contg., May 25, 1910. 1⅓ pp.

An editorial discussing the method of determining reasonable rates to be charged by Public Service corporations and an analysis of the distinction between profits and interest on invested capital.

Cost of Generating and Distributing Electricity for Lighting and Power, New York Edison Co.—Eng.-Contg., May 11, 1910. 1⅓ pp.

Analysis of the cost to the New York Edison Company of producing and distributing for lighting and power purposes.

Railroad Location Surveys and Estimates

By F. LAVIS, M. Am. Soc. C. E.
Resident Engineer Pennsylvania Railroad Tunnels.
Formerly Locating Engineer Choctaw, Oklahoma & Gulf Railroad, etc.

In an exhaustive review of this book, the "Railroad Gazette" says: "Once in a while a scientific book appears that combines the threefold elements of mastery of the subject, clearness of expression and elegance in the use of English, a combination as rare as it is attractive. The book at hand is of this sort, and the interest of the reader or student is held through every line of the text. **It is one of those rare productions in which there is not a wasted word and whose scientific value is high in that it tells clearly and concisely just what every student and engineer should know.**"

The contents include chapters on: Resumé of Methods and Explanation of Terms—Reconnaissance—Organization and Equipment—The Preliminary Survey, Field Work—Maps and Office Work—Location—Suburban Rapid Transit Railways—Estimates and Tables of Quantities—Surveys in Tropical Countries and Notes on Modifications of Organization and Equipment—Trigonometrical and Curve Formulae, Table of Level Cuttings, etc.

270 pages; 73 illustrations; 10 folding plates;
$3.00 net, postpaid.

The Myron C. Clark Publishing Co.

355 Dearborn Street, CHICAGO

Cost of Power for Various Industries Under Ordinary Conditions.—Eng.-Contg., May 4, 1910. 3¼ pp.

This paper is a very full discussion of the costs of various kinds of power for industrial plants. The various items going to make up costs are analyzed. A table is given showing average costs of power of different kinds under comparable conditions.

Some Driving Records in Tunnel Construction.—Contr., May 1, 1910.

Being some records taken from a paper delivered by Mr. R. B. Woodworth before the Railway Club of Pittsburg and showing by comparison, the progress made in tunnel driving in the last half century.

Insurance Company Compiles Valuable Figures.—Cem. Era, May, 1910. 2 pp.

This article is a compilation of figures showing the comparative costs, depreciation, life, and earning values of three classes of buildings, namely, concrete, brick and frame buildings.

The Compensation of Workmen. By H. L. Gantt. R. R. Age Gaz. May 6, 1910. 4 pp.

A discussion relating to the principles involved in fixing the compensation of workmen. From the standpoint of a man who has been training workmen in the metal trades.

BOOK REVIEWS.

Handbook of Cost Data.—By Halbert P. Gillette. Myron C. Clark Publishing Co., Chicago, Ill. Flexible Leather, 4¾x7 ins.; 1854 pp.; illustrated; $5.

The first edition of this book, published some five years ago, met with exceptional favor from engineers and contractors. It may be fairly said to have opened up a new field of engineering data by giving in collected and carefully analyzed form the mass of data on costs of engineering compiled by the author from his own work and that of other engineers and contractors. Since the publication of this first edition the mass of cost data has been enlarged very materially, and the 600 pages of the first edition has increased to 1854 pages in the second edition. In reality the increase is much greater than these figures would indicate, since a finer type and a larger page are used for the second edition, making, roughly, a page of this edition equal to a page and a half of the old edition. In a measure this wealth of new matter proves embarrassing, as it makes a book of too great a size to be a convenient book for the pocket. This, however, is a hindrance which most readers will be willing to overlook in consideration of the additional data which are made available for their use.

The present Handbook is divided into 15 chapters, and a list of their headings, with the number of pages embraced by each, will give a fair idea of the scope and of the amount of the data presented. The list is as follows: Principles of Engineering and Cost Keeping, 118 pp.; Earth Excavation, 52 pp.; Rock Excavation and Quarrying, 87 pp.; Roads, Streets and Pavements, 217 pp.; Stone Masonry, 55 pp.; Concrete, 110 pp.; Water-works, 161 pp.; Sewers, 143 pp.; Timberwork, 124 pp.; Buildings, 54 pp.; Railways, Steam and Electric, 348 pp.; Bridges and Culverts, 246 pp.; Steelwork, 29 pp.; Engineering and Surveying, 34 pp., and Miscellaneous, 63 pp. A comparison of the contents of the new edition with the old indicates that the author has worked to fill the gaps in the first edition, and has succeeded in very large measure.

The book is primarily a collection of cost data, from actual practice. It gives the costs of work done under very many conditions and under varying qualities of management. In so far as possible these variations have been indicated in the text leading up to the tabulations of cost. With these in mind and with attention to the author's remarks on the meaning and limitations of cost data there would seem to be little excuse for a misuse of the data presented. Cost data, like test data, or any other kind of data used in engineering design and construction, have to be used with intelligence. The greater the intelligence and experience of the user are the more certain and exact will be his use of these data. The book before us is without qualification the most complete collection of engineering cost data ever published.

Cost Keeping and Management Engineering

By HALBERT P. GILLETTE and RICHARD T. DANA

This is the first book ever published on the subject of cost keeping on contract work. Its authors are pioneers in the field, and, although they have written much that has appeared in the form of articles—particularly in the pages of *Engineering-Contracting*—this book is the first presentation on the subject in a complete and logical sequence.

In the opening chapter the authors endeavor to reduce the **management of men** to a science, by laying down **ten fundamental laws of management,** each of which is fully discussed.

The second chapter contain 17 **fundamental rules for securing minimum cost.** These two chapters are wholly novel and of far reaching importance to all men who are, or hope to be, in charge of other men.

The authors then proceed to describe and illustrate their own systems of cost keeping, which they have developed on their own contract work and have also been installed on the work of other contractors, giving both the **punch card reports**—a form of report which they were the first to devise and the more common blanks to be filled in with pencil.

The last chapter contains numerous systems of cost keeping developed by other engineers and contractors, and is a **veritable mine of suggestive hints** as well as of examples of excellent blanks for special purposes.

The following is the list of chapters:

CHAPTER I—The Ten Laws of Management.
CHAPTER II—Rules for Securing Minimum Cost.
CHAPTER III—Piece Rate, Bonus and Other Systems of Payment.
CHAPTER IV—Measuring the Output of Workmen.
CHAPTER V—Cost Keeping.
CHAPTER VI—Office Appliances and Methods.
CHAPTER VII—Bookkeeping for Small Contractors.
CHAPTER VIII—Miscellaneous Cost Report Blanks and Systems of Cost Keeping.

Cloth, 6x9 inches, 360 pages. Price $3.50 net, postpaid.

13-21 Park Row, New York 355 Dearborn Street, Chicago

A History of the Logarithmic Slide Rule and Allied Instruments.—By Florian Cajori. Engineering News Pub. Co., New York. Cloth, 5x 7½ ins.; 126+X pp.; illustrated; $1.

We find from this little book that some 256 different slide rules have been designed since 1800 and that the bibliography of the slide rule dates back to 1620 and comprises something over 200 articles and books important enough to be listed. With these facts before us one's first thought is changed to a belief that perhaps there is use for a history of this useful little instrument. The book written by Mr. Cajori is purely a history, not at all a manual on the use of the slide rule, and only to a small extent an explanation of its use. So far as we can judge the author has been at the pains of considerble research to make his statements and dates accurate, and for those who incline to such records his book should prove of interest.

Hydraulic Excavation Tables.—U. S. Reclamation Service, Washington, D. C. Cloth, 4¼x 6½ ins.; 117 pp.; paper, $1; cloth, $1.25.

This volume contains 39 tables, partly original and partly modified from existing tables, and compiled specifically for the use of the engineers of the Reclamation Service. Roughly, there are eight tables of mean velocity of water in open channels computed from Kutter's formula; seven tables of areas of trapezoidal channels; seven tables of quantities per 100 ft. of channel, and four tables relating to discharges over wiers; tables of trigonometric junctions, etc. Altogether the list comprises about all the tables to be used in irrigation work. An introduction explains the use of the tables when necessary.

Cotton Mill Map of Alabama and Georgia.—By H. E. Anchutz, Montgomery, Ala. Two folding maps in cloth covers. 3½x6 ins. $1.

As the title implies, this is a map of the states of Alabama and Georgia, showing the counties, county seats, and only such cities, towns and villages to which cotton mills are adjacent. It gives the location of every cotton mill in the two states, and each mill is indicated by a solid square. These squares are numbered, and by referring to the index and the key number, the address, number of spindles, kind of power used, and consumption of cotton per year in bales can be ascertained. Under each town or village where a mill is located is given one, two, or all of the letters, "W. P. T." This indicates whether the mill is reached by Western Union, Postal Telegraph, or Long Distance Telephone. All railways are plainly marked. The map also shows the exact location of all water powers, both in operation or available. This map has been designed to show the things that are needed by the mill owner and operator, cotton broker, cotton buyer, mill and electrical supply men and their traveling representatives, and all dealers in cotton products and machinery, as well as to show the man interested where water powers are awaiting development, or are in operation.

The Field Practice of Railway Location.—By Willard Beahan. Engineering News Pub. Co., New York. Cloth, 6x9 ins.; 252 pp.; illustrated; $3.

Before the appearance of the first edition of this book the best methods to be used in railroad location were largely a matter of tradition. Chief engineers experienced in location taught their methods to assistants, who, in turn, developed and improved them. In this way a distinct branch of civil engineering came into existence; one depending less on theory than on the experience of a generation of pioneer locating engineers. Wellington's great work placed on a sound basis the entire subject of economics as applied to railroad location. Every book on the subject must necessarily follow his theories. But it remained to the engineer in the field to work out direct and efficient methods for applying these theories.

This book is prepared primarily to meet the needs of chiefs of party. It is broad in its scope and covers both theories and methods. The details of the work of a party in making surveys are treated briefly. The greater part of the book is devoted to broad questions of organization, economics, management and care of parties, and matters generally of importance to the man in responsible charge of location.

The reader naturally makes comparison with another notable book on location that has appeared recently, namely, "Railroad Location Surveys and Estimates," by F. Lavis. In this

Two "System" Books

These two books will not exactly meet your needs in every particular. No book on systematizing construction work can; but there is a wealth of suggestions in these books which can be used to advantage on your own construction work, no matter what kind it may be. We are speaking of "Bricklaying System" and of "Field System," by Gilbreth. One review of "Bricklaying System" pronounced it the only practical treatise on bricklaying ever written, and a remarkable book in that it described methods of greatly reducing the cost of laying brick, in spite of the fact that the art is as ancient as the pyramids.

The "Field System" is a series of rules and instructions for the guidance of superintendents and foremen, the object being to secure uniformity of procedure and economy of performance on general contract work.

The "Bricklaying" contains 330 pages (6x9 inches) and its price is $3.00 net, postpaid.

The "Field System" contains 194 pages (bound in leather) and its price is $3.00 net, post paid.

The May, 1910, Issue Contains

"The Value of Geological Science to the Petroleum and Natural Gas Business."

By FREDERICK G. CLAPP,
Consulting Geological Engineer

An extensive illustrated paper with discussion on the relation of oil and gas pools to geological structure in different parts of the world.

"The Selection of a Boiler Feed Water."

By J. C. W. GRETH, M. E.

A paper and extensive discussion giving analyses of many typical waters and their treatment. A number of tables are introduced giving detailed costs of operation of a number of water-softening plants.

ELMER K. HILES, Secretary,
2511 Oliver Building, PITTSBURGH

The Greatest Treatise on Concrete

We publish nine excellent books on concrete, each covering a different branch of the subject. But if only one book can be afforded by an engineer, we recommend Reid's "Concrete and Reinforced Concrete Construction." It remains the largest American book on concrete—906 pages (6x9 inches)—and its wealth of line drawings (715 illustrations) gives it precedence over every other book in the English language for expensive "cuts." Not only does Reid's "Concrete" take precedence for size, but for its thoroughness of exposition and for detailed information of this vast subject. This is indicated pretty well—although inadequately—in the 16-page pamphlet giving table of contents and sample pages, which you will do well to send for.

The price of the book is $5 net, postpaid. If interested in special treatises on concrete, send for our eight pamphlets of eight books on concrete, besides the one above mentioned.

The Myron C. Clark Publishing Co.

13-21 Park Row, New York

The Journal OF Western Society OF Engineers

is a high grade bi-monthly illustrated magazine of about one hundred pages in each number, and contains the original papers of engineering interest that have been presented to the society, with the discussion of the same. These papers treat of subjects in all lines of engineering, are well illustrated and should be of value to engineers, chemists, scientific and business men everywhere.

The Subscription Price is $3.00 a Year

The circulation is about 1,600 copies of each issue, six times a year.

The JOURNAL is a valuable advertising medium, as it goes all over the world and to a high class of technical readers. Advertisements, if of interest to engineers, may be published in the JOURNAL.

For rates or other information concerning the JOURNAL of the Western Society of Engineers address or call upon the Secretary, **1735 Monadnock Block, Chicago.**

work the details of conducting surveys in the field are exhaustively treated, the book being written primarily for this purpose. It is unusual to find two books that so completely supplement each other. Together they make as complete a library on railroad location as the practicing engineer is likely to need.

The divisions of the subject are presented in the order in which they would occur in practice. The chapter on preliminary survey is preceded by chapters on character of road, reconnaisance and organization of parties; while the discussion of geology and topography, the locomotive, cost and capitalization, lead naturally to the chapter on located line.

No claim is made to originality in methods or theories. The author states that his purpose is to record the methods of a vanishing generation of locating engineers "before they shall have all passed away." The economic units and principles are those of Wellington.

There are two essentials of good location on which the author insists frequently. Their value is so self-evident that universal acceptance would seem to be a matter of course. Yet much poor location has resulted in the past through ignorance of these simple principles, or through indifference to them. "Never diverge from a straight line between controlling points unless you can show definite and sufficient economic reasons for doing so." And again, "the direction and location of the drainage is a frame-work on which you must hang your located line."

The author believes that too much stress cannot be laid on the necessity for thorough reconnaisance. Reconnaisance is of value not only in its influence on the final location, but as an economical means of avoiding unnecessary preliminary surveys.

It is stated that no locating engineer can be truly successful unless he is "in reality" a good topographer. And by this is meant, not that the engineer should be able to make neat maps, but that he must have an "eye for country" and must possess excellent judgment in matters pertaining to topography. Topography depends on geological structure. Hence, there is included in the book an excellent chapter by John C. Branner entitled "Geology in its relation to topography."

As a whole, the book is one of principles rather than methods. It is well suited to the needs of the locating engineer, and in scarcely less degree to the needs of the railroad officer responsible for the economic success of a railroad location.

Concrete Construction Methods and Costs

By HALBERT P. GILLETTE
and
CHARLES S. HILL

THIS book is unique among all the books on concrete. It is devoted exclusively to the **methods and costs** of concrete construction. It tells what an engineer or contractor needs in **estimating the cost** and in **reducing the cost** of concrete work, both plain and reinforced. The various designs of forms and centers, and the layout of plant for mixing, conveying and placing concrete, receive the most complete treatment ever given to these important subjects.

The book should be purchased by every contractor and by every concrete foreman and superintendent, for it is the best "correspondence school" on practical concrete construction that has ever appeared in print.

Cloth, 6x9 inches; 700 pages; 306 illustrations; price $5.00 net, postpaid.

BOOKS

on the "Methods and Cost" of construction work.

Send for Catalog

THE MYRON C. CLARK PUB. CO.,
355 Dearborn Street, CHICAGO

The Whole Field Of

CONCRETE AND REINFORCED CONCRETE

DESIGN—CONSTRUCTION—INSPECTION

is covered by the books briefly described below:

Concrete and Reinforced Concrete Construction
By HOMER A. REID
The best, most complete and comprehensive book covering both the theory of concrete design and the practice of concrete construction.
Cloth, 6½x9 inches—906 pages. **Price, $5.00 net, postpaid.**

Engineers' Pocketbook of Reinforced Concrete
By E. LEE HEIDENREICH
A book written by an experienced designer and specially fitted for the use of engineers engaged in designing concrete structures.
Leather, 4½x6¾ inches—374 pages. **Price, $3.00 net, postpaid.**

Theory and Design of Reinforced Concrete Arches
By ARVID REUTERDAHL
Presenting the theory in perfectly complete form, requiring no reference to other books in so far as arch design is concerned.
Cloth, 6x9 inches—132 pages. **Price, $2.00 net, postpaid.**

Diagrams for Designing Reinforced Concrete Structures
By G. F. DODGE
The diagrams, plotted on logarithmic paper, are so devised that results may be read direct for all conditions occurring in ordinary practice.
Half cloth, 12x15 inches—112 pages. **Price, $4.00 net, postpaid.**

Reinforced Concrete—A Manual of Practice
By ERNEST McCULLOUGH
Presents the subject of design in the simplest possible manner and sets forth lucidly the principles of safe and good construction.
Cloth, 5x8 inches—128 pages. **Price, $1.50 net, postpaid.**

Concrete Bridges and Culverts
By H. G. TYRRELL
A useful book for the engineer, presenting formulas without taking up their mathematical derivation and giving tables of dimensions and quantities and estimates of cost.
Flexible leather—272 pages. **Price, $3.00 net, postpaid.**

Concrete Construction—Methods and Cost
By H. P. GILLETTE and C. S. HILL
Devoted exclusively to the methods and cost of concrete and reinforced concrete construction and intended for engineers and contractors engaged in such construction and for designers who are seeking for the data upon which to insure economy in their designs.
Cloth, 6x9 inches—700 pages. **Price, $5.00 net, postpaid.**

Concrete Inspection
By C. S. HILL
A manual of information and instructions for inspectors of concrete work.
Cloth, 3½x6 inches—186 pages. **Price, $1.00 net, postpaid.**

Practical Cement Testing
By W. PURVES TAYLOR
Written by a practical cement tester and the first exhaustive treatise on this important subject.
Cloth, 6x9 inches—330 pages. **Price, $3.00 net, postpaid.**

Cements, Mortars and Concretes
By MYRON S. FALK
A complete report of the results of tests made during the past fifteen years
Cloth, 6x9 inches—184 pages. **Price, $2.50 net, postpaid.**

The Reinforced Concrete Pocket-Book
By L. J. MENSCH
A book written by a trained engineer and successful contractor for the use of engineers and those having a knowledge of mechanics and building construction.
Full leather, 216 pages, 4¼x6¼ inches. **Price, $4.00 net, postpaid.**

Contract News Section

of

ENGINEERING-CONTRACTING

A Consolidation of Engineering-Contracting—Contract News—Engineering World—The Dirt Mover.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The railroad bill, which has been under almost continuous discussion in the Senate since March 15, was passed by that body on June 3 by a vote of 50 to 10 and now goes to the House.—H. S. Kerbaugh, Inc., Philadelphia, Pa., has been awarded Barge Canal Contract No. 63 by the New York state superintendent of public works, the contract calling for the improvement of the canal for a distance of 12 miles at the west end of Monroe county, New York, and the contract price being $1,990,000.—It is now given out that the placing of a $30,000,000 Chinese loan for railroad building by American and European bankers is contingent on the ability of the Chinese government to raise the money at home. The $30,000,000 loan was arranged for the commencement of building operations of two trunk line railroads in China, one running north and south from Hankow to Canton and the other east and west from Hankow to Schuzean.—Secretary Ballinger has postponed giving a decision in the Hetch-Hecky Valley controversy in connection with the proposed municipal water supply for San Francisco, until May 1, 1911.—Among the cities which are planning extensive municipal improvements, requiring special bond issues, are Kansas City, Mo., and Cleveland, O. The former will vote July 19 on issuing $3,500,000 of bonds and the latter will vote July 22 on issuing $2,250,000. The Cleveland bond issue is to be used for the elimination of grade crossings.—Among the sub-contracts let recently for work on the Western Maryland R. R. extension are the following: R. W. Hill & Co., New York city, for grading between Connellsville and Herd Tract; R. Galrards, Connellsville, Pa., for grading from Herd Tract to Indian Creek; W. H. McCourt, Akron, O., for grading between Indian Creek and Ohiopyle; Connestoga Contracting Co., Pittsburg, Pa., 500,000 cu. yds. of excavation and 10 miles of line work; Foley Brothers, Pittsburg, Pa., six miles of road; John Connelly, Pittsburg, Pa., considerable masonry work between Cumberland, Md., and Meyersdale, Pa. Among the other railroad construction contracts let during the past week are the following: John Scott & Sons, St. Louis, Mo., for the extension of the Arkansas Central & Eastern R. R. from McGreagor to Stuttgart, Ark., a distance of 18 miles, the contract including clearing, grubbing, grading, bridging and track laying; the Clifton-Applegate Co., Missoula, Mont., for 15 miles of the 40 mile extension of the Big Blackfoot Ry. to the north of the Clearwater River in Montana, and White Bros., Missoula, Mont., for the remaining 25 miles of the extension; Rose & Ellis, for grading four miles of the Abilene Southern Ry. out of Hamlin, Tex.; Foley, Welch & Stewart, for making a 2 mile rock fill in Rainy Lake near Port Arthur, Ont., to replace a wooden trestle; the B. & M. Construction Co., 1001 Schofield Bldg., Cleveland, O., for the construction of the 26 miles line of the Alliance & Akron Short Line Ry. from Alliance northwest to Akron, O.—At the end of May, of the 3,732 miles of line to be built for the Grand Trunk Pacific R. R., there is now in operation 1,017 miles of main line and 315 miles of branch line. There is now under actual construction and contracted for completion this year 210 miles of main line and 440 miles of branch line. The longest continuous stretch is from Fort Williams on Lake Superior to Edson, 146 miles west of Edmonton, a distance of about 1,300 miles.

Railroad Construction in New England.

It has been so long since a new steam railroad, with actual prospects of construction, has been proposed in Massachusetts, that when such an event occurs it is worthy of notice. For some little time there have been rumors that the Grand Trunk Ry. wished to secure an entrance to Providence, R. I. Early this year officials of the Grand Trunk made an application to the State Legislature of Rhode Island for a charter for the Southern New England Ry. The application met with some opposition from the New York, New Haven & Hartford R. R. whose field would be invaded, but early in April it was favorably acted upon by the Rhode Island legislature, thus giving the Grand Trunk the right to construct the portion of the line in that state. On June 7 the State Railway Commission of Massachusetts gave a hearing on the application for permission to construct that portion of the Southern England Ry. in Massachusetts. In the meantime the engineering work had been under way and at the hearing on June 7, engineers of the Grand Trunk submitted estimates showing that the 58 miles of line in Massachusetts would cost $3,500,000 or about $60,000 per mile. This estimate included the following items: Right of way, $192,381; grading, $1,163,287; bridging, $1,047,221; tracks, $536,769; station buildings, $26,000; telegraph lines, $17,433 and water service, $9,000. The plans show that the line will leave the New London & Northern R. R. at Palmer, Mass., and by an almost straight line will enter Providence, R. I. To reach Palmer, the Grand Trunk will use the tracks of a subsidiary company, the Central Vermont R. R. This latter road gives the Grand Trunk a direct line from Montreal to Windsor, Vt. From Windsor to Brattleboro, Vt., 34 miles, the Central Vermont runs over the Boston & Maine tracks, but it owns the strip of tracks from Brattleboro to South Vernon, a distance of 10 miles. From South Vernon to New London, Conn., the Central Vermont runs over its own tracks. Now the Boston & Maine R. R. which is said to be controlled by the New York, New Haven & Hartford R. R., operates over the Central Vermont tracks from White River Junction, Vt., to Windsor, some 16 miles and from Brattleboro to South Vernon. Immediately on the announcement of the plans of the Grand Trunk to Boston & Maine put engineers in the field to locate a line from Windsor, Vt., to West Lebanon, N. H., where a connection could be made with two division lines of the B. & M., thus doing away with its use of the C. V. tracks from White River Junction. The B. & M. also placed engineers in the field for a branch line between Brattleboro at Hinsdale, N. H., to connect its Connecticut & Passumpsic Division with its branch operating between South Vernon and Keene, N. H., and in that way avoid using the C. V. tracks from Brattleboro to South Vernon. No definite announcement has been made by the Boston & Maine as to its intention to construct the branch lines. The Grand Trunk, however, is going ahead with the plans and it is very probable that it will have actual construction work started this year. If it does Massachusetts will see more new steam railroad construction than it has had for the last decade.

Clever Advice.

The Aztecs, basing their opinion on the yellow press reports, of their time, believed that Cortez's Spanish cavalrymen were half man, half horse; many estimable residents of country towns have almost as strange an idea regarding a railroad grading gang, as witness the following news note from a recent issue of the Shakoopee, Minn., Tribune: "The scene of the reconstruction of the C., M. & St. P. railroad has shifted as far west as Prior Lake during the past fortnight and will soon be here. About two-hundred dago workmen are working along the roadbed which will probably be opened in July. The work is progressing very rapidly and most likely we will have the workmen in our own city within the next week, if so we hope that those who are interested in the work of these people will be clever enough to remain at a safe distance from a quarrel which we hear is apt to arise at any time. The quarrels usually arise between the different nationalities and as this band of workmen consists of besides what we commonly call dagoes, Polanders and Arabians the officials are trying their best to keep them as far apart as possible."

Stronger Bridges and Culverts In Iowa.

The state of Iowa for the next year or so would seem to offer quite a few opportunities for the builders of small bridges and culverts. The Iowa legislature has passed a bill requiring that all culverts and bridges be made strong enough to support traction engines. Heretofore the law has been that the owners of such engines must take the responsibility for any damage resulting from the breaking down of a bridge or culvert under the passage of a traction engine. If the bridge was weak it was up to the owner of the engine to reinforce it by laying planks, across which the wheels of the traction outfit could pass. This part of the law was stricken out, so that as it now stands the responsibility rests on the tax payers, and in the case of damage suits the counties will have to pay. As a result many of the present bridges and culverts undoubtedly will be reconstructed in order to make them strong enough to support traction engines.

Construction work on the Arizona & Eastern is progressing rapidly, according to reports from Phoenix, Ariz. Shattuck & Edinger, Los Angeles, Cal., the contractors, have 450 head of stock at work and will add 180 head more at once. Five grading camps have been installed between Phoenix and the Agua Friar River. Right of way difficulties have all been straightened out and it is expected by July 15th to have grading completed to the Hassayampa River. L. H. Long, Tucson, Ariz., is Chief Engineer.

The Camden & Trenton Traction Co., of Trenton, N. J., have been incorporated with a capital stock of $675,000, the incorporators being Frysinger Evans, Eugene A. Martin and Charles R. Renz.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ARKANSAS.

The McCrory & Beedeville Southern Ry. Co. has just completed surveys for its projected 14-mile line from McCrory, Ark., on the Iron Mountain & Southern Ry. to Beedeville, Ark., and is now clearing the right of way. The company will do its own construction work. Grover G. McCrory, McCrory, Ark., is Chief Engineer and Clayton Hailey, McCrory, Ark., as President.

ILLINOIS.

McCann Bros. Construction Co., Bridgeport, Ill., has 12 miles of grading to let at Bridgeport. Good material and good prices; two way pay.

KANSAS.

The Oklahoma & Kansas Railway Co. is about to start surveys for its proposed electric line. This line will connect Columbus and Galena, Kan., with Baxter Springs, Kan. It will then extend South through Sunny Side, Lincolnville and Hattanville, Okla., to Miami, Okla. The W. K. Palmer Co., engineers, Kansas City, Mo., have been retained as Consulting Engineers.

MISSISSIPPI.

Surveys have not been made as yet, nor has all of the capital been secured for the construction by the projected 44 mile line of the Newton Northwestern R. R. This road projects a line from Newton, Miss., through Conchalta, Walnut Grove and Carthage. It is thought that the company will be ready to let contracts in about four months. D. L. Ragland, Newton, Miss., is President. H. C. Majure, Newton, Miss., is also interested.

NEW YORK.

The Long Island R. R., J. R. Savage, chief engineer, Jamaica, N. Y., is now grading for a second track between Whitestone Junction and Whitestone Landing. It is the company's intention, however, to install only a long passing siding between Flushing — Bridge Street—and College Point at this time.

OHIO.

The Alliance & Akron Short Line Ry. Co. has awarded the contract for the construction of its projected 26 mile line from Alliance northwest to Akron to the B. & M. Construction Co., 1001 Schofield Bldg., Cleveland, O. L. C. Marble, Columbus, O., is Chief Engineer of the railroad and Chas. G. Keith, Alliance, O., is President.

Contracts for the construction of the proposed line of the Cincinnati, Portsmouth, Pomeroy & Pittsburg Electric Ry. will not be let before Sept. 1 of this year. As previously noted in these columns the company projects a 466-mile line along the Ohio River Valley, from Cincinnati, O., to Pittsburg, Pa. C. P. Sanborn, Huntington, W. Va., is Chief Engineer.

OREGON.

The Coos Bay Rapid Transit Co., incorporated last March, with a capital stock of $1,000,000, projects a line extending from the water front in North Bend, back one-quarter mile, and then to the water front in Marshfield, and with streets covered in Marshfield, covers a distance of approximately 5½ miles. The company has expended in clearing and grading up to this time approximately $25,000, and it is hoped to have the road completed and in operation by Nov. 1, or at the latest by the first of the year. An order has been placed with the Colorado Fuel & Iron Co. for 600 tons of 70-lb. rails, together with necessary fastenings, for partial delivery about June 15th to 20th. On May 26th contract was also entered into with the American Car Co. for two 40 ft. cars, interurban style, delivery to be made about Oct. 1. The offices of the company are at North Bend, Ore. W. P. Evans is president; M. E. Everitt, vice president; A. W. Myers, treasurer, and C. G. Hockett, secretary.

PENNSYLVANIA.

We are advised that the Pittsburg & Susquehanna Valley R. R. has not as yet prepared any plans for the construction of a railroad from Fernwood to Utahville.

Sub contracts for work on the extension of the Western Maryland R. R. from Cumberland, Md., to Connellsville, Pa., have been let as follows: The Connestoga Contracting Co., House Bldg., Pittsburg, Pa., 500,000 yds. of excavation and 10 miles of line work, and Foley Brothers, Pittsburg, six miles of the road; John Connelly, of Pittsburg, for a large amount of masonry between Cumberland and Meyersdale, Pa.

UTAH.

Regarding the construction of proposed second track Ogden to Farmington, Utah, by the Oregon Short Line Railroad Co., we are advised that nothing further has been done toward the construction of this line, and no actual work has yet been started. No contracts have been let.

WISCONSIN.

Surveys have been completed and the capital has been secured for the construction of an extension by the Fairchild & Northwestern Ry. west from Fairchild, Wis., to a connection with the Chicago, Milwaukee & St. Paul Ry., at Caryville. The projected length is 30 miles. No decision has been reached as to when construction contracts will be let. H. J. Bernier, Minneapolis, Minn., is Engineer. N. C. Foster, Fairchild, Wis., is President.

CANADA.

M. P. Cotton, Vancouver, B. C., as previously noted, has the contract for constructing the Burnby line of the British Columbia Electric Ry. from Vancouver to New Westminster, B. C. The contract includes 100,000 cu. yds. of earth excavation and six small trestles.

Power Developments, Levees, Drainage and Irrigation Works.

CALIFORNIA.

The directors of the Hallwood Irrigation District will let contracts for the excavation of its main ditch and laterals, which have a total length of about 13 miles, some time in September or October, after the harvest and hot weather are over. This will give ample time for the completion of the work so that the water may be used for the season of 1911. The yardage is estimated at 85,000. The main ditch is 20 ft. wide at top. The intake is through a concrete tunnel 120 ft. long, 6 ft. in the clear, with a capacity of 7,000 in. and will contain 205 cu. yds. of concrete. To safeguard the water-right, this latter work is now under way and will be finished in July. The acreage served is at present about 3,000, but the full capacity of the ditch which will serve 7,000 acres or more, will no doubt be reached soon. E. E. Long, Marysville, Cal., is secretary of the district.

COLORADO.

The Clay Creek Reservoir & Irrigation Co., C. N. Scott, secretary, Lamar, Colo., which early in May awarded a contract for constructing a dam and canals in Clay Creek, 12 miles south of Lamar, is also to construct an irrigation system on Rule Creek near Las Animas, Colo. The last system will be about 40 per cent larger than the Clay Creek proposition. The Kaw Valley Construction Co., care H. C. Byrnes, Lamar, Colo., has the cantract for the Clay Creek work. This includes 90,000 cu. yds. of earth excavation, 6,000 cu. yds. of rock excavation, 290,000 cu. yds. of embankment and 4,000 cu. yds. of concrete masonry.

ILLINOIS

The Meredosia Lake Drainage & Levee District, of which Charles W. Brown, Jacksonville, Ill., is Engineer, on June 2 awarded the contract for 102,194 cu. yds. of levee work and 74,352 cu. yds. of ditch work to J. M. O'Meara & Son, Cullom, Ill., at 12.9 cts. per cu. yd. for the levee work and a similar bid for the ditch work. Other bidders on the work were as follows: Templeton & Hamilton, of Morocco, Ind., whose bid was for the ditch work alone at 11½ cts., amounted to $8,550.47; Lewis & Davis, of Champaign, Ill., who also bid only for the ditch work at 14 cts., amounting to $10,409.28; T. M. O'Meara of Cullom, Ill., whose bid on ditch work was at .0997 cts., amounting to $7,412.90; E. D. Barr of Potterville, Mich., whose bid was for the ditch work at 22 cts., amounting to $16,357.44; A. R. Putnam of Valparaiso, Ind., whose bid for ditch work was at 9 cts., amounting to $6,691.68, and for levee work 20 cts. and 22 cts. for the various portions as designated, the amount for this part of the work amounting to $20,231.26.

IOWA.

W. J. Bowen & Sons, Nashua, Ia., owning water power rights near Waverly are to let a contract for building a concrete dam and concrete flumes. It is expected to have the work started about July 1.

MICHIGAN.

The Muskegon Dock & Dredging Co., Muskegon, Mich., has been awarded the contract at $8,583 for repairing piers at Pentwater, for the U. S. Government. The work includes cutting down and removing old work, oak piles and timber, pine or Douglas fir plank and timber, screw bolts, drift bolts, angle irons, spikes, dredging and stone. Bids were opened at the U. S. Engineer's office at Grand Rapids, on June 3.

MINNESOTA.

Bids are asked by C. J. Hemmingson, County Auditor, Hallock, Minn., until June 20, for constructing two ditches as follows: County Ditch No. 19 at Donaldson, 86,137 cu. yds., estimated cost $15,964; and County Ditch No. 18 at Caribou, 85,445 cu. yds., estimated cost $13,072. O. L. Hamery, Crookston, Minn., is engineer for Ditch No. 19, and J. E. Dishington, Warren, Minn., is engineer for Ditch No. 18.

RHODE ISLAND.

As noted in our last issue bids are being asked by Lt. Col. J. S. Sanford, U. S. engineers, Newport, R. I., until 11 a. m., June 23, for repairing breakwater at Sakonnet harbor. The work will consist of two classes, first: furnishing and placing about 1,500 tons of stone in the breakwater, wherever necessary, and, second: replacing and rearranging stone heretofore delivered on the breakwater but which has been displaced by wave action. The new stone must be of granite or gneiss of good quality, and must be quarry stone of angular shape in pieces weighing at least 1½ tons each, with at least 10 per cent weighing 5 tons or over, except that smaller stones must be used where necessary to fill up openings and give firm bearings.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

(Confirmed Reports continued.)

SOUTH DAKOTA.

Bids were opened June 1, by the Constructing Quartermaster at Fort Meade, S. Dak., for the construction of a concrete dam, spillway, valve chambers, etc. Bids were asked on two types of dam, A and B. Bartlett & Kling, Cedar Rapids, Ia., at the following unit prices being the only bidders: Earth excavation, 36 cts. per cu. yd.; rock excavation, $1.80 per cu. yd.; rip rap, $1.40 per cu. yd.; 16 in. C. I. pipe without valves, $5.84 per lin. ft.; 12 in. C. I. pipe without valves, $4.67 per lin. ft.; 4 in. vitrified drain pipe, 50 cts. per lin. ft.; concrete, $7.35 per cu. yd.; valves and fittings lump sum of $875. Type "A" dam requires 16,000 cu. yds. of concrete, and type "B" requires 6,000 cu. yds.

TENNESSEE.

As noted in our last issue bids are being asked by Mayor M. L. Walker, U. S. Engineer, Memphis, Tenn., for about 160,000 cu. yds. of levee enlargement in the Reelfoot and White River Districts. The Reelfoot District work includes 60,000 cu. yds. all river side enlargement, near Slough Lgd., Tenn. This work will be built to grade with 8 feet crown 3 to 1 slopes on both sides and a foot topping added on the 8 foot crown. The grubbing will be measured from the toe of the old slope to a line 4 feet beyond the new slope line. The average height of old levee is 10.5 feet; average height of new 8-ft. crown above old levee, 1 foot. The White River District work includes 100,000 cu. yds. all landside borrow and landside enlargement located 10 miles below Helena, Ark. This work will be built to grade with an 8-foot crown; 3 to 1 slopes on both sides and a 1-foot topping will be added on the 8-foot crown. The average height of old levee is about 14 ft. and the average height of new 8-ft. crown over old levee is about 1½ ft. Work is to be completed not later than Feb. 1, 1911.

Alabama Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Birmingham & Edgewood Electric Ry. Co., of Birmingham, Ala., is stated to be securing funds in New York City for the extension of its Shades Valley car line to the top of Shades Mountain. Right of way has been secured and the extension will be built if financial arrangements can be perfected. George Troupe Brazelton, Birmingham, Ala., is interested.

The McCartin Constructing Co., of Birmingham, has been incorporated, with a capital stock of $5,000, and will engage in a general constructing business. John McCartin is President and Eugene Fries Secretary and Treasurer.

Surveys are to be made soon for a projected railroad from the Decaturs to Fall City in Winston county. The projected length of the line is 60 miles. Capt. C. H. Bassett, New Decatur, is interested.

Construction work is to be started soon on the railroad from Baldwin County to Pensacola. As projected the line will first be built from Milview, Fla., to Lillian, Ala., crossing Perdido Bay on a bridge 3,300 ft. long. Charles Barclay, Bay Minnette, Ala., is interested.

The Louisville & Nashville R. R., J. E. Willoughby, Engineer of Construction, Louisville, Ky., has been making surveys of a line from Hayes' Mill, four miles north of Athens, beginning at the main line there and going east several miles from the main line, passing by Holland's Gin and thence by Elkton, Tenn., leaving Elkmont, Veto, Prospect and Aspen Hill to the west. It is said this survey is being made with a view of straightening the main line, avoiding the tunnel north of Prospect, Tenn., and the steep hill just north of Elkmont.

The Union Springs & Northern Ry., W. M. Blount, President, Union Springs, Ala., is reported to have purchased the Tallassee & Montgomery R. R. This is a short line from Milstead to Tallassee. The Union Springs & Northern recently began an extension from Fort Davis to Milstead, 30 miles, and the idea of the sale is to build on to Alexander City, on the Central of Georgia, thus giving a line through from Union Springs to that point.

The Pensacola-Mobile-New Orleans R. R., now under construction from Pensacola, Fla., to Mobile, Ala., has been granted, by the Federal Government, permission to trestle and bridge Appalachee, Tensas and Mobile Rivers. The road plans to enter Mobile from the eastern shore on a trestle over the Appalachee River. Draw bridges will be placed on Tensas and Mobile Rivers. Of the 45 miles of line, 16 have been graded and ballasted and are ready for the steel rails. A large order has been placed for rails and as soon as the rails are received extension will be taken up rapidly. Henry McLaughlin, Pensacola, Fla., is President.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

John Scott & Sons, St. Louis, Mo., have been awarded the contract for the extension of Arkansas Central & Eastern R. R. from McGreagor to Stuttgart, Ark., a distance of 18 miles. The contract includes clearing, grubbing, bridging, tresseling and track laying. Work will be commenced at once, and the contract calls for its completion within six months from May 18.

It is reported here in Fort Smith, Ark., that construction work will be commenced shortly on the proposed Fort Smith-Van Buren Railroad. The line will cross the river over the new free bridge now under construction.

The Louisiana & Northwestern Ry. Co. has completed arrangements for the extension of the road from Magnolia, Ark., to Prescott, by way of Waldo. Propositions are now before the cities along the right of way and if accepted construction work will be started immediately. J. A. Knox, Homer, La., is Chief Engineer of the company.

The Warren & Ouachita Valley Ry. Co. has filed a certificate with the Secretary of State of Arkansas increasing the present capital to $500,000. W. S. Hobbs, Warren, Ark., is General Manager.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Board of Works of San Francisco has recommended to the Supervisor that the Stockton St. tunnel at San Francisco be constructed. The plans, as drawn, provide for a tunnel the width of the street to be lined with white brick with ample pavements on either side for pedestrians. The cost, including reimbursement for damaged property, it is stated, will be in the neighborhood of $450,000.

A special meeting of the stockholders of the proposed Vallejo & Northern Ry. is to be held at Vallejo on June 28 to vote on a proposition of increasing the capital stock from $2,500,000 to $10,000,000. It is reported that grading work on the projected line will be started next month.

Orlin Hudson, City Engineer of Richmond, Cal., has started to make preliminary surveys for the two sites proposed for the location of a municipal wharf preparatory to placing a proposition before the city in the form of a bond election for securing funds for the purpose. The two propositions suggested consist of either boring a tunnel through the Potrero ridge of hills and building a wharf on the other side or improving the present water front lying at the mouth of the Cutting canal.

Arthur S. Bent, Los Angeles, has been awarded the contract for increasing the size and capacity of the Sweetwater reservoir near San Diego. The contract price was about $150,000 and the work calls for the raising of the dam 15 ft. A reinforced concrete buttress 27 ft. thick will be built across the Sweetwater canyon, a distance of 300 ft. It will be 113 ft. high, and will require 15,000 bbls. of cement.

The Truckee Lumber Co., Flood Bldg., San Francisco, will, it is said, have construction work started in July on a railroad from Orville to its timber holdings in the mountains, in the Berry Creek district. The proposed road will be 30 miles in length.

Keller & Kerckhoff, whose franchise to build a railroad to Del Mar, from San Diego, Cal., expired May 12, have applied to the City Council for an extension of one year and it is expected that the body will act in favor of the same.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Denver City Tramway Co., of Denver, is to extend its 17th Ave. line out that street to Dahlia, across Dahlia to 19th Ave. in Denver, and thence to Krameria St.

The Colorado & Southern Ry., H. W. Cowan, Chief Engineer, Denver, Colo., is reported to have awarded the contract for constructing its line from Pueblo to Walsenburg. The road will cost about $3,000,000, and has been projected for some years.

Representatives of the Northern Colorado Power Co. have been conferring with B. D. Sanborn of Greeley regarding the purchase of the Boyd Lake reservoir, located four miles northeast of Loveland. It is said that if the power company secures the reservoir it will install a pumping plant and furnish water for irrigation for 10,000 acres lying between Loveland and Greeley, which was recently incorporated into an irrigation district to use water from this reservoir.

Surveys are being made for a railroad to be built from Monte Vista on the Denver & Rio Grande to Saguache. The line will be about 40 miles long and is backed by a Cheyenne syndicate. J. B. Cosgriff, Continental Bank, Salt Lake City, Utah, is interested.

According to advices from Denver, Colo., arrangements have been made with the Callahan Construction Co. for the immediate construction of the proposed Collbran branch line of the Rio Grande Junction Road. As planned the route will start at a point on the Rio Grande Junction, at a point 8 miles north of Palisade, and penetrate the Plateau Valley for a distance of 25 miles. Location surveys have been made, right of way has been secured and the sale of bonds, amounting to $550,000, necessary for the work, has been arranged for. J. J. Yeckel is President of the company and Paul Blount, Denver, Colo., is Engineer.

Denver capitalists have organized the Montezuma & Western Ry. Co., and have taken over the Argentine Tunnel Ry. Co. and the Transcontinental tunnel, which was designed to connect Clear Creek with Summit County, and will proceed to complete the tunnel at once. When this work has been accomplished the new company will proceed to construct a railroad from Denver to Leadville, which will be only 122 miles in length, as against 276 miles via the Rio Grande and 213 miles via the Colorado Midland road. Allied with the new railroad company is the Denver and Montezuma Development Company, which will take care of the mining interests which will be developed in the Argentine estate by the construction of the railroad, and the Argentine Construction Company, which has secured the contract to build the road. The officers and principal stockholders in the three

companies are George W. Brooks, D. W. Brown, A. J. Woodruff, Whitney Newton, Zeph Charles Felt, W. W. Booth, F. T. Henry and Edwin Van Cise of Denver and C. S. Birkins, president of a national bank of Idaho Springs. It is understood that the new combination has secured control of the Argentine Central Railway, extending from Silver Plume to the top of Mt. McClellan, and will also operate that road with the extension to Gray's Peak, planned for this year and next.

The Chicago, Burlington & Quincy Ry. has acquired nearly all right of way and will let the contracts at once for the construction of the line from Denver and Cheyenne, Wyo., 30 miles. Another line on which it is expected construction will commence soon lies between Hudson, Colo., on the main line to Denver and Greeley, Colo. This eventually is planned as a part of the Burlington's direct line between Denver and the Wyoming system. From Greeley the Colorado & Southern line to Wellington will be used and north of Wellington the new link will be built reaching Cheyenne, thus giving the Burlington a direct line from Orin Junction to Denver, and connecting the Denver and Cheyenne lines with a cross road.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chattahoochee Valley Ry., J. A. Avary, General Manager, West Point, Ga., is said to be preparing to take steps soon for securing an entrance to Columbus, Ga. The southern terminus of this line is Jester, Ala., 18 miles above Columbus, and a road is now being built from Motts, on the Central of Georgia, to Goat Rock, on the river, which latter place is only seven miles from Jester. It is contemplated to fill in the gap between the latter places and come into Columbus from Motts over the Central of Georgia.

The State Railroad Commission held a hearing June 2 on the application of Middle Georgia Interurban R. R. Co. for authority to sell stocks and bonds for the purpose of constructing a railroad from Griffin, Ga., through Jackson, Indian Springs and Monticello.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Representatives of the proposed Pana-Decatur interurban line have been in Pana with a view to selecting a site there for the power house and station. J. J. Pierpont, Pana, is interested.

Steps are being taken for financing an extension of the Peoples Traction Co., from Galesburg. Considerable work toward securing the right of way and subscriptions to stock has already been done. A. P. Higgins, Galesburg, Ill., is President and the Knox Engineering Co., Chicago, Ill., are the Managing Engineers.

Business men of Alexis have closed a deal with the Rock Island Southern R. R. Co., W. W. McCullough, General Manager, Monmouth, Ill., for a branch line to Alexis. A stock subscription of $50,000 and right of way is to be given.

The Illinois Traction System, Champaign, has announced its intention of building a cut-off from Streator to Mackinaw Junction to connect with the main line, giving Ottawa, now connected with Streator, Morris and eventually Joliet a direct route to St. Louis.

The Chicago & Alton R. R., W. D. Taylor, Chief Engineer, Chicago, has completed detailed plans for an improvement in Chicago which will involve the expenditure of about $1,000,000. The company has acquired land for an extension of its terminal warehouses and an office building to be erected at 2 Van Buren St.

The C. L. Gray Construction Co., of East St. Louis, has increased its capital stock from $750,000 to $1,500,000 and the number of directors from seven to eleven.

The East St. Louis Belt Terminal Ry. Co., incorporated several months ago, has applied for a right of way at East St. Louis. The incorporators of the company include John L. Flannigen, representative in the Illinois Legislature, Albert E. Meints and Fred W. Kraft of East St. Louis, and Charles T. Smiley of O'Fallon, Ill.

The Clay County Commissioners, Louisville, Ill., have appointed Henry Strigle, Thomas Tetrick and Ernest Price commissioners to superintend the drainage canal soon to be constructed in the eastern part of Clay County.

The Chicago, Burlington & Quincy R. R. has purchased 160 acres of land near Beardstown containing sand pits and is said to contemplate the expenditure of $100,000 in constructing a new yard and making other changes and betterments.

The Jacobs Engineering Co., of Ottawa, Ill., has been incorporated with a capital stock of $30,000 and will engage in an excavating business and deal in excavating machinery. The incorporators are William F. Jacobs, Charles C. Jacobs and W. C. MacFarlane.

The Chicago, Milwaukee & Gary Ry., I. W. Troxel, Chief Engineer, Chicago, has been making surveys between Aurora and Joliet with a view of building its own line between these cities. The road has a lease of the Elgin, Joliet & Eastern Ry. tracks between these cities which has a year more to run, and it is understood that this lease is not to be renewed.

Reports in the vicinity of Geneva, Ill., are to the effect that the Chicago & Northwestern Ry. has plans well under way for the establishment of four-track way to West Chicago. After this work is completed the tracks will be elevated from Geneva to Chicago, eliminating grade crossings and the curve at Geneva.

The Kelsey-Brewer Syndicate of Grand Rapids, Mich., has purchased the property of the Kankakee Electric Light Co., of Kankakee, and plan to expend several hundred thousand dollars in improving the plants at Kankakee and also give the city a system of ornamental lights.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Gary & Southern Ry. has received shipments of steel rails for its interurban line between Gary and Crown Point. Grading work on the line has been under way for some time. Ahlborn Brothers Construction Co., Hammond, Ind., have the contract for the work.

It is stated that the Fort Wayne & Springfield Traction Co., now building a line from Decatur to Portland, will extend the road from that city eastward to Minster, O., by way of Ft. Recovery.

In our last issue we mentioned that Harold Keith, County surveyor, Goshen, had completed his estimate of the widening, deepening and staightening of Rock Run. Additional information, as follows, is now available. The work will require 425,000 cu. yds. of excavating. There are 485 stations in the main stem, with 100 ft. to the station. The main drain is 16 ft. wide at the head and 60 ft. wide at the source. The average depth is 7 ft. The total length of main trunk and laterals is 12.2 miles. The four large laterals are 2,300, 3,700, 3,800 and 6,000 ft. long.

The Louisville & Northern Ry. & Lighting Co. of New Albany, Ind., is considering building a 1½ mile extension from its New Albany terminals to the New Albany Park and Fair Association grounds. The extension would cost about $20,000.

The Beers-Offutt Construction Co., of Fort Wayne, has been incorporated with a capital stock of $10,000, and will engage in a railroad construction business. G. W. Beers, D. N. Beers, and H. C. Offutt are directors.

Plans are stated to have been approved by the Wabash R. R. for laying 40 miles of double track between Detroit and Montpelier this summer. The work will be in charge of W. S. Danes, Peru, Engineer of Maintenance-of-Way.

The receiver for the Indianapolis, Newcastle & Toledo Traction Co., 30 Union Trust Bldg., Indianapolis, has asked permission to issue $35,000 worth of receiver's certificates to raise funds for extending the tracks of the company.

The management of the railroads formerly controlled by John R. Walsh, of Chicago, has decided to build a short line to tap the Clinton coal fields of Indiana. The new line will be constructed this summer, and will start from a point near Bernice, in Vermillion County, and extend east and south to the Clinton district.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City of Davenport has voted favorably on extending the franchises of the Tri-City Ry. Co. and the light and gas companies at Davenport. The owners of the companies were also granted the right to construct the new interurban into Davenport. This interurban line has been projected for some time. It is to connect Davenport and Muscatine, and three routes are proposed: One leaves Davenport and runs to Blue Grass, from Blue Grass to Sweetland Center, and then into Muscatine; the second route proposed is the river route through Buffalo, Montpelier and Fairport into Muscatine, while the third route is a proposed combination of parts of the other two, the line to run from Davenport to Buffalo, then out to Blue Grass and Sweetland Center and into Muscatine. Surveys have been made, it is stated, over all three of these routes, but further and more detailed surveys are to be made at once. Jos. F. Porter, Davenport, Ia., is interested.

The Charles City & Western Ry. of Charles City has completed its car barn at Charles City, has purchased one electric car and a freight motor and the steel rails, ties, graders, etc., with necessary equipment to construct 18 miles of track. The road has been surveyed from Charles City to Marble Rock and likewise to Alta Vista.

The Iowa City Electric Street Ry. Co. has been organized at Iowa City with a capital stock of $100,000 and will this summer build a line to Rundell's addition in Iowa City. A further extension will be made in 1911. J. O. Schulz, Secretary Commercial Club, Iowa City, is President.

The City of Creston has raised its allotment of $40,000 to secure the construction of Creston, Macksburg & Winterset Interurban.

Committee of the stockholders of the Sioux City & Spirit Lake Interurban R. R. have started soliciting subscriptions in Sioux City, Ia., and other cities along the right of way in order that preliminaries may be disposed of.

Commercial clubs of Hawarden, Rock Rapids, Doon, Ia., and Luverne, Minn., have launched a movement toward securing the extension of the Doon Branch of the Chicago & Northwestern R. R. to Hawarden, thus opening a through line to Sioux City, Ia.

A bond issue of $300,000 has been authorized by the stockholders of the Albia Interurban Co. to extend the line to Buxton, 12 miles north of Albia. The engineering and construction is in charge of the Engineering Construction & Securities Company, of Chicago, of which C. Q. Ross and C. B. Judd, of Atlantic, Ia., are President and Chief Engineer, respectively.

An official of the Chicago, Rock Island & Pacific Ry. is quoted as stating that the matter of constructing a line between Forest City, Ia., and Rockford is still under consideration. As proposed the line would pass through Nora Springs, Mason City and Clear Lake, Ia.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

W. B. McKinley of Champaign, Ill., principal owner of the Illinois Traction System, and promoter of the Kansas City to St. Louis electric line, has purchased the Atchison electric light and power plant and the nine miles of street railway in Atchison. The Topeka street railway system was also recently purchased. It is the plan of Mr. McKinley to connect Atchison, Topeka, Kansas City and St. Louis by a system of electric lines.

A report from El Dorado, Kan., intimates that the Atchison, Topeka & Santa Fe Railroad Co. will extend its Madison branch from Gridley to Hamilton this year. The extension

will intersect the Fredonia branch and connect with the Howard branch. It would give that country a more direct route to Kansas City. Incidentally it would give the Santa Fe four lines from Kansas City to Emporia.

Advices from Lerado, Kan., state that surveyors are running lines for the construction of a railroad from Lerado to Turon, through Stafford County, and construction work is to commence as soon as surveys are completed.

A preliminary survey is being made for the projected north and south railroad from Beatrice, Neb., to Wichita, Kan., by way of Abilene, Kan. A meeting will be held at Newton, Kan., to arrange for final surveys and financing the project.

Construction work has been resumed on the proposed line of the Kiowa and Hardtner R. R. in Kansas. T. E. Luttgerding is Superintendent of the company. It is expected that the line will be pushed through to completion.

The first eight miles of the Cherryvale, Oklahoma & Texas R. R., from Caney, Kan., has been graded and the outfits have been moved below Cotton Creek to take up work on the final stretch of the section to Wann, Okla. It is expected that grading work to that place will be completed by July 1, when track laying will be commenced.

Louisiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Booth & Flinn, Ltd., Pittsburg, Pa., who have the general contract for the construction of a gas line from Shreveport, La., to Little Rock, Ark., for the Arkansas Natural Gas Co., have placed an order for 269 miles of 10-in., 12-in., 16-in., and 18-in. steel pipe. Work on the pipe line is to be started immediately, and is to be completed by March next year. The main line will extend from Caddo Parish, La., to Little Rock, Ark. The main branch lines will supply gas for domestic use and for manufacturing purposes to a large number of cities and towns of that section.

Good progress is being made with the construction of the Sunset-Central's 51-mile branch line from Lafayette to Baton Rouge, La., and it is probable that the extension will be opened for traffic about August. This road is being built with a view of forming connection with the Yazoo and Mississippi Valley road, Louisiana Railway and Navigation Company's lines and the Baton Rouge, Hammond and Eastern at Baton Rouge, and the Alexandria branch of the Morgan line and the Louisiana Western, at Lafayette.

A special tax of 5 mills has been voted by the citizens of Cottonport, La., to be appropriated to the Gulf Belt Northwestern Railway Co., providing the line is constructed through this city within two years.

The Mineral Wells Electric Ry. Co. has been organized at Shreveport, La., for the purpose of building and operating a street and suburban railway. S. B. Cantey, of Fort Worth, Tex., is president; N. C. Blanchard, former governor of Louisiana, vice president, and W. C. Fordess, of Fort Worth, secretary. The other incorporators are D. T. Bomar, of Fort Worth, and L. R. Smith, of Shreveport.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chicago, Milwaukee & St. Paul Ry. is reported to be making final surveys for a line to the Iron River and Stambaugh Districts of the Menominee iron range. The company plans to extend the Crystal Falls branch into the Iron River valley, touching the new Chicogoan mine and various promising explorations en route. The length of the extension by the proposed route is about 17 miles.

Common Council of Detroit, Mich., has adopted two resolutions permitting the Detroit Union Railway to loop the Ghene street line by constructing a new track on Grand avenue and to double track the Mack avenue line from Baldwin avenue east to the city limits.

The Grand Trunk Ry. has completed plans for improvements in Pontiac involving the expenditure of $62,000. Of this sum, $25,000 will go for a new brick freight house, and the remainder for increasing the trackage.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A special election is to be held at Kansas City, on July 19, to vote on a city bond issue totalling $3,650,000 for the following purposes: Parks and boulevards, $650,000; market houses, $50,000; fire department, $100,000; water works, $1,000,000 river front, $75,000; workhouse, $50,000; street paving plant, $50,000; incinerating plants, $100,000; tuberculosis hospital, $50,000; sewers, $300,000; Chace school, $25,000; armories, $250,000; art museums, $200,000; Twelfth street trafficway, $475,000; bridges, $200,000; hospital for poor children, $75,000.

The Intercity Viaduct Freight Ry. Co., a new company, has asked the city council of Kansas City, for a 30-year franchise to transfer and deliver freight from all railroads entering the city to a central warehouse. J. W. Reinhart, Kansas City, is interested.

At a meeting of the stockholders of the St. Louis, St. Charles & Northern Traction Association, held at Middleton on June 2, it was voted to build the line from St. Charles by way of St. Peters, Old Monroe, Troy, Olney, Marling, Middletown and Mount Carmel to Laddonia.

According to an estimate by Charles Martin, Civil Engineer, the total cost of lowering the railroad crossings at St. Louis, Mo., would be about $1,360,000.

Grading has been commenced on the projected 45-mile line of the Laclede, Dallas & Western from Phillipsburg to Buffalo, Mo., and will, it is said, be pushed through to an early completion. Davis & Blair, Joplin, Mo., have the contract. The officers of the railway are: B. B. Coffee, president; Sam T. McDermott, vice president; J. R. Kelley, treasurer; W. F. Farren, secretary, and Meservey G. German, general counsel.

St. Louis Items.

BY A. B. KOENIG.

It looked like the week before election in East St. Louis, Ill., last Tuesday with the crowd gathered around the Mayor's office waiting for a chance to talk about the respective merits of brick and creosote block as paving materials for State street. A victory for the brick advocates was won. Speeches were made by Mrs. M. V. Recklein, N. A. Schein, Fred W. Kraft, George Ferold, T. P. Bates, Phil Traband and others. All of the orators grew fervent in praise of the side they championed, and bitter in denouncing the other. The contract involves spending $280,000. When the work is completed State street will be a boulevard all the way to the city limits at Edgemont. The car tracks will be moved to the center of the street and trees planted along the edges. It is expected that Belleville will take up the improvement at Edgemont and make the street a splendid roadway for automobiles and other vehicles.

M. B. Burgher, city engineer of Hannibal, and a party of four left that city on June 6 for St. Charles, Mo., for the purpose of making a survey for the proposed interurban line, between St. Charles and Laddonia, a distance of sixty miles, which will, in all probability, be later extended to Paris, making the length of the road 90 miles.

Bills to improve six sections of street in the slum district were passed by the House of Delegates last Friday. The council already has passed the bills and they become law when signed by the presiding officer of each house and the mayor. For many years an effort has been made to get street improvements in the Ghetto but bills have always been defeated. The Health Department has claimed muddy streets have done much to prevent a cleaning up of the district. Seventh, Eighth, Tenth and Eleventh streets, from Biddle to Cass; Thirteenth, from Franklin to Biddle, and Biddle, from Seventh to Broadway, are the streets to be improved. Brick is to be used in each case. A public hearing was held in the House on the bills, and a protest was made, but a favorable report was made by the Public Improvements Committee on the recommendation of the Health Department and the Board of Public Improvements, and more than a two-thirds vote was given the bills. Four Democrats, Delegates Igce, Brennan, Golden and Gallagher, voted against the bills. The Board of Public Improvements submitted new bills to the Assembly for the improvement of Twelfth street in two sections, from Franklin to Hebert street, and Gay street, from Twelfth to Thirteenth, with wood blocks, Twelfth street is considered in its mile and a half of length as two separate propositions, partly to prevent the defeat of the whole because of a partial protest and partly to make the work easier to control by dividing the contract. Twentieth street, in four sections, from Washington Ave. to Salisbury street is included in the list, the material being brick. The sections are Washington to O'Fallon, to Cass, to Branch to Salisbury. Other streets included in the new bills are: McPherson, from King's Highway to Union, wood blocks; Natural Bridge road from Grand to Spring, and from Spring to Fair, brick; Adelaide, from Conde to 590 feet east, asphalt and Waldemar from Forest to McCausland, telford.

Wm. O'Connor can use an outfit of about six teams on the Santa Fe R. R. at Stanfort, Mo. In addition to this he will give them the privilege of boarding about 20 of his own men at $4.00 per week. Tents and everything will be furnished.

A. G. Jennings spent a couple of days in town last week. At the present time he is building the interurban line from Wichita to Newton, Kas. (28 miles). Commenced track laying on it the other day. He also has the contract for grading the yards for the new Union Depot at Joplin, Mo. In addition to this he is ballasting 21 miles of the Pittsburg and Joplin electric line. He says he is able to handle more work and is looking for it.

We have not heard from our old friends Hannon & Hickey lately, but from all accounts and reports they are getting along fine with every one of their contracts.

While on our recent visit west we met Wm. Bates of the McIntyre-Tiese Const. Co. in Wichita, Kas. Billy was looking prosperous, in fact better than we ever saw him look in our life and we have known him for a long while.

J. W. (Doc) Skinner came in from his bridge work on the Big Four R. R. in Southern Indiana and returned after getting another nice bridge and pile driving contract on the Iron Mountain R. R. south of here.

The Board of Public Improvements last Friday reconsidered its action of Tuesday in rejecting all bids on the dead animal contract and awarded the contract to the East St. Louis Rendering Company, paying the city $425 a month. Bids had been rejected because the contract by which the city was to furnish Chesley Island for a plant had been declared illegal by the Law Department, but the board, finding the other bids were legal, and all except President Reber opposing the use of Chesley Island for the plant, decided to award the contract. The contract is to run to 1929. It is to be effective not later than six months from the day of the award, the company having option to begin sooner if ready. The price exceeds the cost of collection but from $500 to $1,000 a year, and contrasts strikingly with the past expenditure for disposing of dead animal. A few years ago the city was paying several thousand dollars a year for the disposal, besides collecting the animals at its own expense, and when the new administration took charge the city was considering itself lucky to find a contractor willing to accept them without pay. The bill authorizing the purchase of Chesley Island is still pending.

Judge Wm. Bates of Memphis, Tenn., came in while we were out west. Failed to get any information from him. Sorry we missed you Judge. Come around again soon.

The Terminal Railroad Association and other railroads using the Mill Creek Valley at Compton avenue have agreed to accept the ordinance now pending in the House of Delegates for the abolition of the Compton avenue viaduct, if the city will assume the damages to private property. The bill requires

the Terminal, the Frisco, Wabash and Missouri Pacific to abolish the Compton crossing by erecting a steel viaduct over the valley. The roads agree to assume the damages to all railroad property adjoining the viaduct. One piece of property owned by a private individual, if damaged, is to be taken care of by the city. The city's share of the damages is estimated to be less than $2,000. The viaduct is to cost about $375,000. A similar proposition is under consideration for the elimination of the Ewing avenue viaduct by the same railroads, and for the separation of the grades at Union and King's Highway on the Terminal belt line on the north side.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Dakota & Montana Ry. Co. has filed its articles of incorporation at Helena, Mont. This company is incorporated by William Wallace, Jr., R. F. Gaines and T. B. Weir, all of Helena, Mont., and proposes building and operating a line of railway from some point to connect with the Dakota & Montana Ry. in Custer county and with the Northern Pacific Ry. line in the same county. The capital stock is $10,000, all of which has been subscribed.

Great Northern R. R. officials have decided to start work at once on track improvement near the Cascade tunnel and expect by the end of summer to have changed tracks and built snow sheds that will make impossible any further trouble at that point. The work will be done under the direction of Alex. Stewart, Seattle, Wash., Assistant Chief Engineer of the company.

Thomas M. Ward, C. E., has completed a survey for the construction of a railroad from Anaconda, Mont., across the Great Continental Divide to French Gulch. Three lines were run before the route was found which was satisfactory. It connects with the B., A. & P. road at the Allen spur, and also with the Stuart branch of the Northern Pacific Railroad near the Mill Creek stock yards, making two transcontinental connections. The line of track starts from the west side of the creek and runs along the foothills for a mile or more and then crosses to the east side of the valley, and by a series of curves approaches the crest of the range and by a short cut will head into the mountains for a 1,500 ft. tunnel.

The Northern Pacific has secured most of the right-of-way necessary for the proposed new line between Logan and Bozeman, Mont., and also a site for the construction of repair shops where the proposed new line will cross the present line a few miles east of Belgrade, Mont. Construction work will begin soon, it is said.

According to reports from Mandan, N. Dak., bids have been received by the engineers of the Northern Pacific Ry. for the construction of the Mott-Terry extension of the Western Dakota Ry., in Montana. Work on this line will be commenced some time this summer and together, with the 125-mile line between Mandan and Mott, the line when completed will give the Northern Pacific 350 miles of new track. The cost of the work is estimated above $12,500,000.

The Cannon Ball branch of the Chicago, Milwaukee & St. Paul Ry. will, it is said, be completed and in operation about July 1. The road runs from Mobridge, S. Dak., across the two Dakotas, terminating within a few miles of the Montana border.

The Big Blackfoot Ry. Co. has awarded contracts for the extension of its line 40 miles up the Blackfoot River. The Clifton-Applegate Co., Missoula, Mont., will build the 15 miles of line from the present terminus at McNamara Landing to the mouth of the Clearwater River. White Brothers, 1st National Bank Bldg., Missoula, Mont., will construct 25 miles from the Clearwater up the Blackfoot toward Nevada Creek. Work is to be started immediately and it is expected that the 40 miles will be completed this season. The Clifton-Applegate Co. has been building the line from Bonner to the landing at the mouth of Camas Creek and the new contracts will be an extension of this work.

Nebraska Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chicago, Rock Island & Pacific R. R. is said to be planning to build a 5-stall roundhouse at Vine St., in Lincoln, Nebr.

The City Council of Hastings has granted the Omaha, Western & Lincoln R. R. Co. a franchise for the use of certain streets for entrance to the city. The franchise is for 50 years, and is for passenger and express traffic only. The road is to be completed in five years from date of franchise. F. E. Schaaf, Lincoln, Nebr., is interested.

The Nebraska, Kansas & Southern R. R. Co., which projects a line between Garden City and Stockton, Kans., has made a proposition to the Commercial Club of Hastings, Nebr., for an extension of the line to that place.

Surveyors of the Chicago, Burlington & Quincy R. R., according to reports, are running lines from Burwell, Nebr., into the Black Hills.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Village Trustees of Bolivar have granted a franchise to South Western New York Traction Co. for its proposed electric railway to connect Bolivar with Wellsville. The franchise is for a term of 50 years. The new line is to be 15 miles long.

E. M. Graves, Cleveland, O., has been awarded Barge Canal Contract No. 73, calling for the dredging of the channel of the Hudson river from Northumberland to Stillwater. The contract price was $767,467.

The Greenwich Knitting Co. of Greenwich, has purchased additional water rights in the Battenkill with the object of some time in the near future of building a new and higher dam.

The New York State Public Service gave a hearing May 31 at Albany on the application of the New York, New Haven & Hartford R. R. Co. for authority to purchase at par the entire stock of the Westchester Northern R. R. Co., with a capital stock of $1,000,000. The former company owns all of the stock of the New York, Westchester & Boston Ry., which, when built, will have a connection with the Westchester Northern in White Plains.

The New York, Westchester & Northern R. R. Co., mentioned in our last issue in these columns, has been given authority by the upState Public Service Commission to construct its line from a connection in White Plains with the New York, Westchester & Boston Ry. to Lewisboro, on the Connecticut border, and also a branch road from Pound Ridge to connect with the New Haven road at the Connecticut border.

The New York State Public Service Commission has approved the application of the New York Central & Hudson R. R. for permission to build a cut-off line on its Rome, Watertown & Ogdensburg division, between Sanford and Watertown. The cut-off will be 4½ miles of double track and will take long freight trains from factory streets in Watertown.

The Hydraulic Power Co., of Niagara Falls, has increased its capital stock from $500,000 to $12,000,000. The stockholders include: Arthur Schoelkopf, Jacob M. F. Schoelkopf, Geo. W. Olmsted, George B. Matthews, Paul A. Schoelkopf, G. P. Hugo Schoelkopf and Hans Schmidt.

Announcement was made June 1 by President Louis Mazzolla of the Excavators' Union of New York City, that the members of the union had begun a general strike for 22 cents an hour, and that 1,500 men stopped work during the day and more men would strike on the next day.

The Erie R. R., according to present indications, will open the Bergen Hill, N. J., cut-off for regular passenger traffic on July 1. The new cut, which has been in course of construction for the last four years, cost about $6,000,000, and was made for the purpose of obtaining relief from the congested Bergen tunnel, by which the railway reaches its Jersey City terminal. The Bergen cut accommodates four tracks and will add greatly to the facilities of the Erie in and out of New York.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Right of way is being secured for the extension of the lines of the Springfield & Washington Ry. Co., G. W. Baker, General Manager, Washington C. H., O., from its present terminus at South Charleston to Chillicothe. As proposed the extension will pass through South Salem, Jeffersonville, Washington C. H., New Holland and Clarksburg. The necessary capital for construction purposes is said to have been secured and it is proposed to have work started this summer.

The Norfolk & Western R. R. has a considerable part of the work of double tracking its line from Columbus to Kenova well under way. John T. Adams, Columbus, O., has contracts for 10 miles of the new work near Chillicothe.

The Portsmouth Street R. R. & Light Co., Geo. A. Youngman, Chief Engineer, Portsmouth, is said to be considering plans for extending its line to Hanging Rock, making use of an old survey made some years ago, and rights of way which were secured at the time. The line would connect at Hanging Rock with the Ohio Valley Electric Co. line.

Irwin Brothers, Hamilton, have been awarded the contract by the County Commissioners at Hamilton for the construction of the Stout levee from the Trenton bridge on the east side of the Miami River to Middletown. The contract price was $25,477.

The City of Cleveland will vote on July 22 on the issue of $2,250,000 bonds for the elimination of grade crossings and the erection of a tuberculosis sanitarium at Warrensville.

Committees have been appointed by the promoters of the Crosstown Line Ry. of Columbus, O., to secure a charter and right-of-way for the projected line on Fifth Ave., from Shepard to Arlington. The company is to be capitalized at $10,000. William Cushing, President of the Columbus Saw Mill Co., Columbus, O., is interested.

The Mahoning Valley R. R. Company has begun construction work on the five miles of new track on Poland Ave. All the old single track will be taken up and a new double track installed from Cedar St. to the city limits of Youngstown, O.

The necessary capital is stated to have been secured to assure the construction of the proposed traction line connecting Minster with the main line of the Western Ohio Ry. Co. F. D. Carpenter, Lima, O., General Manager of the Western Ohio Ry., is interested in the new line.

The Ohio Engineering & Contracting Co., of Pomeroy, O., has been incorporated with a capital stock of $5,000, William T. McCormick being the principal incorporator.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The necessary capital for the construction of the Enid-El Reno interurban line is reported to have been promised. Judge Whittinghill of Enid, has recently returned from Europe, where he went to finance the line.

The Muskogee Gas & Electric Co., of Muskogee, which is controlled by H. M. Byllesby & Co., Chicago, Ill., has increased its capital stock from $1,500,000 to $4,000,000, with a view, it is said, of installing a large hydroelectric plant on the Grand River 30 miles from Muskogee. The project has been under consideration for some time and preliminary surveys have been made. H. E. Hoagland, Muskogee, is Superintendent.

The Clinton, Oklahoma & Western Railroad recently completed between Clinton and Butler, Okla., is to extend its line, according to reports, on through Korn Colony, and to either Chickasha or Anadarko, Okla. Farmers along the right of way have already subscribed a bonus of $30,000 for the project. The line, if built to Chickasha, will cross every line in Oklahoma, west of Guthrie, except the Santa Fe.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City of Ashland voted June 1 on granting a franchise to J. R. Anderson, Pasadena, Cal., for installing and operating a gas plant at Ashland.

Preliminary surveys have been made for a railroad from Oregon City to Molalla, and it is said that farmers in the vicinity of Oregon City will build the road themselves if they cannot get some company to do it.

The Coos Bay Rapid Transit Co., organized some months ago to build an electric railway between Marshfield and North Bend, has started grading at the terminal grounds located between the two cities. It is announced that the rails have been ordered for the road and clearing and grading on the right of way has been started. The road is to be finished within four months after the question of franchises in both cities is settled.

The Oregonia Construction Co. has been incorporated with a capital stock of $1,000,000, the incorporators being Henry Hoeck, C. G. Hockett and L. D. Kinney. The principal office is at Coos Bay.

H. W. Silkie, who has the contract for constructing 14 miles of the Oregon Trunk Line from Bend, Ore., to the lava beds, is preparing to begin work. His headquarters for the work will be at Bend.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Delaware County & Philadelphia Electric R. R. Co., Clifton Heights, has commenced work on the 69th St. extension at Penn Boulevard and Baltimore Ave., East Lansdowne.

A company has been chartered to construct a line from terminus of the Lykens & Williams Valley Street Ry. line at the eastern end of Dauphin County to Jonestown, three miles away. J. W. Moyer, Pottsville, Pa., owner of the Lykens & Williams Valley Co. is President.

Additional sub contracts for work on the Western Maryland R. R. extension have been let as follows: R. W. Hill & Co., New York City, for grading between Connellsville and Herd Tract; R. Galiardi, Connellsville, for grading from the Herd Tract to Indian Creek; W. H. McCourt, Akron, O., for grading between Indian Creek and Ohiopyle.

The Scranton & Lake Ariel R. R. Co., has been chartered with a capital stock of $120,000, and proposes to construct a 12 mile electric railroad from Moscow to Ariel Borough by way of Hollisterville and Hamilton. The incorporators are as follows: John J. Brown, president; Valentine Blumm, W. J. Davis, John J. Holland, L. P. Wedeman, George Wedeman, John Godwin, E. J. Lynett, F. W. Wollerton, A. G. Rutherford and E. A. Brown, all of Scranton and J. D. Williams, of Jermyn.

The Interstate Railways Company, a holding concern, has announced that a deal embracing the amalgamation of the trolley lines in Wilmington, Del., and Chester, Pa., and electric lighting plants of Wilmington will go into effect June 15. The plant will be taken over by the Wilmington Light & Power Co. The concerns included are the Chester Traction Co. and the trolley line from Darby to Wilmington; Delaware County (Pennsylvania) Railway; Wilmington City Ry. and the Wilmington City Electric Ry. All of the plants will be operated on a lease.

Plans are under way for the construction of an extension of the Buffalo, Rochester & Pittsburg R. R. from Mt. Jewett to Kane, Pa., to replace the 12-mile, narrow gage between the two cities. Motor cars will probably be operated on the new stretch for a start.

The Pennsylvania R. R. is preparing to construct double track line from Elwyn to Wawa, Pa., and other improvements are planned by the company at Lenni, Pa.

The Philadelphia & Reading R. R. is planning on closing the passing sidings along the Lebanon Valley branch in order to give the company a 3-track line between Harrisburg and Reading, Pa. To effect a result between Sheridan and Womelsdorf about 2,000 ft. of track will be built, requiring the removal of about 12,000 cu. ft. of earth and rock, also the construction of a bridge. This portion of the work will cost $17,000.

South Dakota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The South Dakota Central Ry. Co., which operates 103 miles of line between Sioux Falls, S. Dak., and Watertown, is to expend $40,000 to $50,000 this summer in improving the road bed and track.

The Business Men's Union of Watertown, S. Dak., in conjunction with the towns of Astoria, Arco, Ivanhoe, Hendricks and Tyler, Minn., is making an effort to have the Chicago & Northwestern Ry. build a 20-mile spur from Tyler, Minn., to Astoria, S. Dak.

The Winnipeg & Gulf R. R., which projects a road from Winnipeg to the Gulf, passing through Fargo and Sioux Falls, S. Dak., is reported to have purchased the rights of the Brookings & Sioux Falls Ry. Co. The Brookings & Sioux Falls Co. planned on constructing an electric railroad to connect the two cities and intermediate points. It is reported that the survey for the proposed Winnipeg-Gulf railroad is practically completed between Sioux City and Fargo, the route from Fargo running through Rutland, Webster, Watertown, Brookings and Egan.

Tennessee Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Memphis Street Ry. Co., T. H. Tutwiler, president, Memphis, Tenn., has several routes under consideration for the construction of a cross town line in Memphis. Present plans contemplate a line running from Railroad Ave., north to Jackson Ave.

The City Commissioners of Memphis have rejected the proposition of the railroad for the construction of subways and have submitted a counter offer. The first offer made by the railway companies was that they would stand the physical cost of constructing eleven subways, the city to pay the cost of paving approaches and also the damage to abutting property. Estimates made by City Engineer Weatherford fixed the railroads' share of expense at $1,000,000 and that of the city at $600,000.

The Memphis Union Depot Co., of Memphis, opened bids June 7, for the construction of the main building and sheds of the $3,000,000 union station which is to be erected in Memphis.

The Bristol Belt Line Ry. Co., of Bristol, Tenn., has formally taken over the Holston Valley R. R., extending from Bristol through Holston Valley and across the Holston River, a distance of 12 miles. For the present it will be operated as a separate property from the city lines, and it will not be changed to an electric line before next fall. B. L. Dulaney, Bristol, is President.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys are being made for a proposed extension of the Santa Fe Central R. R. from Torrence to a connection with the Pecos Valley line of the Atchison, Topeka and Santa Fe, probably at Roswell, a distance of about 100 miles. The Santa Fe Central runs between Torrence and Santa Fe, connecting at the latter place with the Denver & Rio Grande.

Announcement has been made that the Pecos Valley Southern R. R. will be finished to Saragosa, Tex., from Pecos City by July 1. The distance is 30 miles. Track is already laid about one-half this distance. It is proposed to extend the road to Alpine, about 100 miles, where it will connect with the Southern Pacific. The route of the new line is up the valley of Toyah Creek, where large irrigation enterprises have been established.

Final location surveys are now being made on the route of the proposed extension of the St. Louis, Brownsville & Mexico Ry. (Frisco system), from Brownsville, Tex., to Tampico. It is stated that the construction of the line will be started this fall. The distance is about 300 miles. The route will run inland about 30 miles from the gulf coast. The construction of a number of large bridges will be necessary.

The power house for the Galveston-Houston interurban line, now under construction for the Stone & Webster syndicate, is to be located on the north side of Clear Creek in Harris county, according to a recent decision of Mark Lowd, Houston, southwestern manager of the Stone & Webster Engineering Corporation.

Charles Clarke & Co. of Galveston has finished delivering to the Gulf, Colorado & Santa Fe at Bolivar a shipment of 200,000 ties cut and prepared at Morgan City, La. The delivery of these ties has been by barges, a space of time occupying four months being taken for the delivery. The ties were delivered at an average of 50,000 a month.

A tract of several thousand acres of land near Brownsville is to be developed by J. T. Beamer, of Washington, La., and L. A. Smartt, of San Juan, Hidalgo county, Texas.

C. G. Patton, Houston, has commenced work on his contract for the construction of bridges and culverts on the line of the Temple & Northwestern Ry. between Temple and the Leon River. Over one-third of the line between Gatesville and Hamilton has been completed by the grading crews and with favorable weather prevailing, the entire line will be graded in 90 days.

F. L. Dormant, consulting engineer, of Houston, has been directed by the Mayor of Houston to prepare plans for the filling in of the city ditch on Calhoun Ave., and the construction of underground drainage. It is proposed to fill in the ditch from Baldwin St. to a point where Calhoun Ave. crosses the tracks of the San Antonio and Aransas Pass Ry. and in its place to lay either a brick or a concrete sewer for drainage.

The Black Bayou Ry. Co. has been chartered with a capital stock of $50,000 and proposes to construct a line from Myrtis, Caddo parish, Louisiana, to the southwest corner of Cass county, Texas, beginning at the village of Rossman, thence into Marion county in a westerly direction to Mosely, about six miles east of Jefferson, a total distance of 22 miles. The incorporators are S. H. Chatten, F. H. Brown and C. C. Rossman of Kansas City, Mo.; R. L. Trigg, S. M. Ragland, Robert Tucker, J. G. Hoffman and S. A. Collom of Texarkana, W. H. Welch and J. P. Cook of Myrtis.

Preliminary matters are well along for the construction of a street railway in Greenville, for which A. Price, N. T. Lause and A. Emanuel, representing Dayton, O., capitalists, some two months ago applied for a franchise. The work of constructing the line will start some time next month. Five miles of line will be built at once, and in order to reach the main residence sections of the city some eight or nine miles of car line will be required. The system will cost about $200,000 when completed.

Rose & Ellis have the contract for grading four miles of the Abilene Southern Ry. out of Hamlin.

Citizens of Bridgeport, Tex., have accepted the proposition of the Chicago, Weatherford & Brazos Valley Ry. Co. to subscribe a bonus of $12,000 and eight miles of right-of-way to secure the construction of that road through Bridgeport to Weatherford, Tex.

The Gulf, Texas & Western has been completed into Seymour, Tex., placing in operation 75 miles of the projected route. The line will ultimately extend to Jacksboro, Tex., and connection will be made with the Santa Fe at either Lubbock or Plainview. F. M. Bowman, Dallas, Tex., is General Manager of the company.

Offices of the construction crews of the Cotton Belt have been opened at Gatesville, Tex., and materials are on hand for the immediate starting of work on the proposed extension to Hamilton, Tex.

Advices from Denison, Tex., are to the effect that the construction gangs of the Missouri, Oklahoma & Gulf Ry. have arrived and are preparing to start grading for the pro-

posed yards and terminals at that point. All work will be completed ready for steel by August 1.

Citizens of Taylor have voted to donate $50,000, seven miles of right-of-way and terminal facilities toward the building of the proposed Taylor-Somerville & Gulf R. R.

Headquarters of the surveying crews of the Texas North & South Ry. are to be established at Fredericksburg and Gillespie, Tex., and final surveys will be made over the preliminaries from Seymour to San Antonio, Tex. Grading contracts will be let shortly, it is said.

B. H. Talmadge, Vice President and General Manager of the Enid, Ochiltree & Western R. R., is quoted as stating that construction work is progressing rapidly on the western end of the proposed line and that steel will be laid into Wilcox, Tex.

R. E. B. Bledsoe, Somerville, Texas, has been appointed chairman of committee to raise the necessary bonus in that city for the construction of the railroad between Taylor and Somerville.

Considerable progress is being made in building the San Antonio, Rio Grande & Tampico, projected to run from San Antonio, Tex., to Tampico, approximately 500 miles. It will, according to a statement made by the promoters, open up a new artesian belt and will benefit San Antonio a great deal. It is intended that 40 miles of the road will be in operation by September.

According to an announcement made by Edward Kennedy, President of the Altus, Lubbock & Roswell R. R., in Houston, Tex., the contract for completing the line from Memphis, Tex., to Lubbock by laying the necessary steel and building bridges and grading right-of-way from Lubbock to Roswell, N. Mex., has been let to the Texas Construction Co. The portion of the projected line between Altus and Hollis, a distance of 60 miles, has been sold to the Wichita Falls & Northwestern Ry.

The St. Louis, Brownsville & Mexico Ry. Co. is planning the construction of a large wharf into the bay at Seadrift, Texas, to accommodate San Antonio Bay and Guadalupe River traffic. E. C. Burgess, Kingsville, Tex., is Engineer Maintenance of Way and Construction.

Citizens of Lexington, Tex., have succeeded in raising several thousand dollars toward the necessary bonus to secure the construction of the proposed Taylor-Somerville R. R. through that place. City of Taylor has voted a bonus of $50,000 toward the project.

Citizens of Palestine, Tex., and Dallas are promoting the construction of a railroad between the two cities, traversing the 100 miles of the most populous agricultural district of Texas.

The Uvalde & Crystal City R. R., now under construction, has engineers in the field making preliminary surveys from Gardendale southeast to either Corpus Christi or Aransas Pass. This road is now completed and in operation from Crystal City to Carrizo Springs. From Gardendale west towards Crystal City, over 18 miles has been graded, and from Crystal City east towards Gardendale seven miles have been graded. The entire distance is 41 miles, and the gap between the two graded sections is being rapidly closed up.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Satisfactory progress is reported in financing the Iron Mountain, St. George & Grand Canyon R. R. Co., which was incorporated some time ago to construct a line from Thermo, on the Salt Lake Route, to Cedar City, through St. George to Kingman, Ariz., crossing the Colorado River about four miles below Rioville. A number of branches will be built, one from Big Sandy to the rim of the Grand Canyon via the oil and timber belt, and other short ones to the different mines along the line. Iron and Washington counties of Utah have offered free right-of-way to the first railroad building through their section.

According to reports from Junction, Utah, plans are on foot for the construction of a railroad from Marysvale, south along the east and west fork of the Sevier River to Junction, Utah.

Advices from Salt Lake City, Utah, are to the effect that the Gould System is planning the construction of a cut-off from the main line at Riverton to the Bingham-Garfield branch at Welby, Utah; thence to the Western Pacific, making a through line from all points west of Garfield. C. A. Blake, Salt Lake City, Utah, is Division Engineer of the Denver & Rio Grande Ry.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Puget Sound Bridge & Dredging Co., Seattle, has been awarded the contract by the city of Olympia for the improvement of the Swantown Slough. The contract price was $61,309, the itemized bid being as follows: 15 cts. per cu. yd. for dirt; piling, $7.50 each; rock work, $2.25 per cu. yd.; brush, $3 per cord, scow measurement.

The Copper River Northwestern Ry., now under construction in Alaska will be in operation to the Bonanza mines at Kennicutt by Nov. 30. At present between 3,000 and 4,000 men are at work on the construction of the line. The company will operate 130 miles of the line this summer from Cordova to the mouth of the Chitna, hauling freight and supplies. Track-laying is in progress from the Miles glacier northward and the 100 miles of new line between Tiekel and the Kennicutt mines will be finished on time.

The Tacoma Railway & Power Co., L. H. Bean, General Manager, Tacoma, is making plans for an extension of its lines to the Bismarck section of the city.

The Grays Harbor Construction Co. will start work at once on the contract for constructing the Willapa branch of the Union Pacific in Washington. The road will extend south from Cosmopolis, Wash.

Nearly all right-of-way has been secured for the proposed extension of the Sunnyside (Wash.) branch of the Northern Pacific from Grandview to a point on the main line near Gibbon, a distance of 13 miles, and condemnation proceedings have been started for the rest of it in order that construction work may be started without further delay. A. R. Cook, Tacoma, Wash., is Engineer Maintenance of Way lines west of Paradise.

The Oregon & Washington Ry. Co. is to construct a spur track 1,800 ft. in length to the site of the proposed Lake River docks, 500 yds. north of the Ridgefield depot in Vancouver, Wash. The work includes the construction of a 300-ft. dock, which will cost, it is estimated, about $10,000.

Secretary of State, Olympia, Wash., has refused Maurice D. Leehey, Seattle, Wash., a charter for a railroad to be known as the Alaska Central Ry., on account of there being one corporation by that name on record.

Advices from Tacoma, Wash., are to the effect that contracts will be let at once for the construction of a 12-mile sea wall along the Tacoma water front and a tunnel 2,900 ft. in length for the projected Point Defiance line of the Northern Pacific.

West Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Charleston, Clendennin & Ganley R. R. Co. has been chartered and proposes to build a line from a point on Elk River opposite the mouth of Blue Creek to a point on Elk River opposite the mouth of Big Buffalo Creek in Clay county. The point at Blue Creek is where the Kanawha & West Virginia crosses the Elk River. The proposed line, it is believed, will connect with the K. & W. Va.

The Chesapeake & Ohio R. R., H. Pierce, engineer of construction, Richmond, Va., according to reports, is shortly to award contracts for the extension of the Guyan Valley branch from the mouth of the Big Huff, in Logan county, through Wyoming county, to connect with the Piney branch, in Raleigh county. The route will be up Big Huff creek by the town of Oceana, on the Clear fork, and thence up to the Laurel fork of Guyan River, a distance of 33 miles to a juncture with the Piney extension.

The Moorefield & Virginia Ry. Co., recently chartered to build 20 miles of line from Moorefield to Peru, Hardy county, W. Va., has elected the following officers: President, William B. Cornell, Romney, W. Va.; vice-president, C. B. Welton, Moorefield, W. Va.; secretary and treasurer, Eugene W. Ailes, Washington, D. C.; general manager and chief engineer, William Trapnell, Romney, W. Va.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Grant R. R. Co., of Mount Hope, Grant county, has been incorporated with a capital stock of $25,000 and proposes to build a line 20 miles long to connect Fennimore and Bagley, in the southwestern lead mining district of Wisconsin. W. E. Lewis, George Monroe, and J. F. Morse are stockholders.

Excavation work has been started at Superior, for four oil tanks to be erected by the Standard Oil Co.; contracts for the erection of the tanks, it is said, will be let shortly at the Duluth, Minn., office of the company.

The C. Reiss Coal Co. has had plans made for the complete rebuilding of the lake front docks at Manitowoc and the work will be done this summer if the city provides adequate facilities for the company to reach its upriver docks.

Work has been started on the development of the water power at Johnsons Falls, four miles from Crivitz for the Crivitz Pulp & Paper Co.

The Board of Public Works of Racine has awarded a contract to S. O. Dixon at 20 cts. per cu yd. for dredging 25,000 cu. yds. of material from the river in that city. The board also awarded a contract for building a retaining wall on Marquette St. to N. F. Reichert at $5.73 per cu. yd.

The first of two scows being built at the shipyards at Manitowoc for the Great Lakes Dredge & Dock Co. has been launched. It is constructed of steel, with a capacity of 600 yds., 137 ft. 4 ins. in length, 32 ft. beam, with a depth of 11 ft. 9 ins. The cost is $25,000, and when the sister ship is finished the company will have completed a $50,000 contract. The scows are used by the Great Lakes Co. in dredging and other work.

The State Railroad Commission has granted the Western Construction Co. a permit to build a railroad from Gilmanton down through the Waumandee valley.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Detailed plans for the improvement of the harbor at Montreal have been approved by the Minister of Marine. These plans as previously noted in these columns contemplate the expenditure of the $6,000,000, appropriated at the recent session of the Canadian Parliament. About $2,000,000 will be expended this year, the main item being the elevation of tracks in the east end, furnishing a twelve-month railway service, and obviating level crossings in the approaches to the docks. Major G. W. Stephens, Montreal, Que., is chairman of the Harbor Commission.

J. A. Boyd, Sault Ste. Marie, Ont., has been awarded the contracts for improvements to be made to the New Ontario dock at Sault Ste. Marie. These will include a fill and enlargement of the freight sheds to double their present capacity. S. I. Penhorwood, Sault Ste. Marie, is superintendent for the company.

The Canadian Northern R. R. is said to be contemplating the commencement of construction on a railway from Hawkesbury, where the Canadian Northern crosses the Ottawa River, into Montreal. The line would give the C. N. R. a direct route between Ottawa and Montreal, and is said to present no engineering difficulties. The line would be along the north bank of the Ottawa from Hawkesbury, almost in a straight line to St. Eustache, where it crosses the Back River into Montreal.

The Canadian Pacific Ry. is reported to have obtained control of the Washington County

"What Are the Facts Respecting the Disintegration of Concrete by Sea Water, Alkali, Sewage, Etc."

We quote the heading of this editorial from a letter written by one of our subscribers. The question cannot be answered definiteively. All the facts are not known and there is not full agreement among engineers and chemists on the significance of those that are known. The disintegration of concrete by sea water has been studied for a quarter of a century. Just recently records of failure of concrete structures in the alkali districts of the western United States has directed attention to the study of the effects of alkali. Individual failures of concrete sewer works from disintegration by sewage and sewage gases are recorded from time to time. Within a few years engineers interested in drainage work have witnessed a clamorous attack on the ability of concrete pipe to withstand long without dissolution the action of even ordinary ground water. Finally these matters have been given wide announcement by engineering and trade publications.

Examples of actual disintegration of concrete from any of the causes mentioned are not numerous, but they have been given general application, partly by careless reasoning and partly by intention by interests antagonistic to concrete. In this way it has been easy for those unacquainted with the circumstances to be lead to believe that concrete is not permanent. There is no reason of course for such apprehension. No general failures have occurred from the causes mentioned; indeed there have been very few when the total number of concrete marine structures, sewers, conduits, etc., is considered. Concrete is a generally durable material for engineering structures. The facts do not permit any other conclusion. Conversely the usefulness of concrete for water-carrying and submerged works makes it important to recognize that occasional want of durability is shown to exist, and imperative to find a means of guarding against such danger.

Considering first the case of disintegration of concrete by alkali, the foremost fact to be noted is that for many years concrete has been used in irrigation and drainage work in the alkali soils of the western United States and only a few failures have been reported. These failures, recorded chiefly in Montana and Colorado, demonstrate with certainty that concrete can be completely disintegrated by alkali water and that no brand of cement is less susceptible to damage than others. They also show conclusively two other facts: (1) That porosity of the concrete increases the chances of disintegration and (2) that porous brick and porous stone suffer equally. Incidentally it may be noted that these conclusions are supported by records of experience in the alkali regions of India. From the evidence hitherto published it is doubtful if any other definite conclusions are warranted.

The practical fact to be set down at present so far as concerns the disintegration of concrete by alkali is that the alkali solution must penetrate the concrete if it is to be dangerous. The exact action of the alkali salts within the concrete mass is not agreed upon. Some observers regard it as being purely physical, like, say, the action of frost; others incline to the belief that it is largely chemical, and still others are of the opinion that it is partly chemical and partly physical. The truth is that the evidence at hand does not permit certain judgment. It is known, however, as certainly as may be that the condition of porosity is essential to the disintegrating action of alkali whether the material be concrete or brick or stone. The obvious preventative is, then, to provide against the penetration of the concrete by the destructive salt laden water, and this brings us around to the undetermined problem of making an impermeable concrete.

Really, however, matters are not in such a bad way as this conclusion might indicate. An impermeable concrete can be made; a rich, well proportioned, well mixed concrete is essentially water tight with the possible resources of waterproofing compounds yet in reserve. A rich dense concrete has been found ample to resist the attack of sea water in all ordinary instances and this is in fact the only precaution accepted by general practice in marine concrete work.

Turning now to the disintegration of concrete in sewerage works we find a number of cases mentioned where such action has been observed but only a few cases where the causes have been carefully studied. As good a summary of the observed effects of sewage on concrete as we know is that of Mr. Rudolph Hering, which we quote as follows:*

There are cases where an acid water or an acid sewage has destroyed a cement structure by contact, and also cases where such a contact in no way injured the structure, but where serious injury has been caused by gases above the waters after escaping from them; so that, in one case the cement has deteriorated only below the water surface, and in the other it has deteriorated only above it.

The speaker has mentioned the effect of acid upon concrete structures as being complex, so far as it is governed, not only by an acid in the liquid, but by gases subsequently arising from it. An acid liquid, as in the case of the sewage sometimes discharged from factories, is known to disintegrate cement pipe. The preventive, as in the former case, if practicable, is to exclude the objectionable element, or to give the cement a protective coating or lining.

The effects of the gases produce an entirely different condition. The most serious of these is that of the sulphuretted hydrogen which may be converted into sulphuric acid in the sewer above the water, and in some cases, as found in a Los Angeles sewer by the City Engineer, Homer Hamlin, sulphur crystals adhere to the bricks of which the sewer was built.

The Los Angeles sewage produced no deterioration of the cement below the water surface, the speaker finding it hard and sound. This condition differed radically from the effects of alkaline sewage where the deterioration was chiefly below the water surface. The escaping sulphuretted hydrogen was converted into sulphuric acid within a short distance of its escape from the sewage, as was distinctly discernible on the surface of the brickwork in the arch. This acid transformed the carbonate of lime in the cement joints into sulphate of lime, a soft, friable gypsum, which gradually caused the complete destruction of the binding quality of the mortar.

In this case, no doubt, a good forced ventilation might have prevented the formation of sulphuric acid, or the sewer might have been given a vitrified lining, or at some time it may be possible to apply a coating which will protect sewers from this sort of destruction. In Los Angeles, for other reasons, the sewer was abandoned for one built in another locality.

Some interesting experience in this direction is reported from Germany. In a Berlin brick sewer, where the mortar was a 1:3 mixture, flakes up to ½ in. in thickness and 2 in. in diameter peeled off the bricks. The thickest peeling was at the cement joints. Upon the mortar was observed a soft white material (gypsum) looking like freshly made lime mortar. Below the water level, the mortar and the bricks were sound, as they were in the Los Angeles case.

To ascertain the cause of this trouble, experiments were made by hanging in the sewer, well above the water level, samples of three materials: marble, cement mortar, and pulverized carbonate of lime. The results are given in Table I.

TABLE I.

Sample.	When suspended in sewer air.	Percentage of SO_3. When observed. 1897.	May, Jan., 1898.	May, 1901.
Marble	Nov., '96	0.019	0.051	0.420
Cement mortar	Feb., '97	0.116	0.200	0.440
Carbonate of lime	Feb., '97	0.010	0.048	1.440

It was found that the sulphuric acid contents in these materials were increased in quantity, as follows:

In the marble, in 14 months, about 20 times;
In the cement mortar, in 11 months, about 4 times;
In the cement mortar, in 4 years, about 6 times;
In the carbonate of lime, in 3 months, about 5 times;
In the carbonate of lime, in 11 months, about 140 times.
In the carbonate of lime, in 4 years, about 250 times.

In the summer of 1901 an analysis of the sewer air gave 200 parts in volume of sulphuretted hydrogen per million parts of air, which was considered an average condition.

At the sewage department of Charlottenburg

*Proceedings American Society of Civil Engineers. Vol. xxxvi, pp. 57, 571.

Copyright 1910, by the Myron C. Clark Publishing Co. All Rights of Republication Reserved.

(Berlin), equal parts of sulphuretted hydrogen and air were passed through cotton at a temperature of 30° cent. (85° Fahr.). Water was then filtered through it, and the presence of sulphuric acid was demonstrated. As a further demonstration, a thin water layer covering the bottom of a closed bottle and containing some fine sulphur powder suspended in it, on being exposed to a temperature of from 20° to 30° Cent. for two weeks, showed a strong reaction of sulphuric acid.

That sulphur is formed directly from sulphuretted hydrogen is shown by the fact that sulphuretted hydrogen when dissolved in water frequently shows sulphur powder on the surface formed by oxidation ($H_2S + O = H_2O + S$); and very fine sulphur powder exposed to air and water is known to be directly converted into sulphuric acid ($S + 3O + H_2O = H_2SO_4$).

The Berlin examinations, therefore, give a confirmation of and an explanation for the Los Angeles case. The sulphuretted hydrogen escaping from the sewage rises to the brick arch, which has a coating of moisture condensed upon the surface. The air converts it first into sulphur, and this is subsequently converted into sulphuric acid.

It had been suspected that bacterial action was responsible for the latter conversion, but Winogradski, in his work on "Sulphur Bacteria," reports that he obtained the same result without it.

It is interesting to add that in 1897, when the foregoing experiments began, the bricks were also subjected to analysis. The porosity was found to vary from 8.5 to 14.3 per cent in bricks of different manufacture. All bricks showed on the surface white exudations of carbonate of lime, but they were very slight upon the densest and very marked upon the most porous brick, and in the latter case the pieces could be easily taken off with a knife.

This phenomenon is explained by Bretschneider as follows: From the layer of moisture on the brick the sulphuric acid enters the pores and is diffused by capillarity through fine cracks and the pores into the interior of the mass. It converts the lime into gypsum, which by this conversion is doubled in volume. Unless the material of the brick can resist the resulting expansion, when some of the gypsum oozes out to form a coating, it cracks and peels off, as above mentioned, to the depth to which the sulphuric acid has formed the gypsum.

It has been observed that the destruction of mortar does not progress in an arithmetical ratio, but gradually decreases, as indicated in Table 3. This is partly explained, also by Bretschneider, by the increased ventilation through additional house connections, which in Germany are used as sewer ventilators, the greatest destruction taking place where there were fewest connections. Secondly, he believes that the percolation of ground-water through the sewer masonry gradually decreases by a closing of the pores on the extrados of the arch, and finds that the surface of the bricks on the interior thus becomes dry and the formation of sulphuric acid ceases.

In Osnabruck, Prussia, a sewer was built in peaty ground in 1903, the ground-water level standing about at the springing line. In half a year signs of destruction were visible, and within several years it became serious.* The cause of the disintegration was laid to iron pyrites (FeS_2) which formed 17 per cent of the peat. The greatest destruction was found on the outside of the sewer and between high and low ground-water level, which is explained by the fact that the conditions for an energetic oxidation were most favorable when both air and water were present at the same time. The least destruction, in fact, almost none, was observed in the interior.

This case is explained by some as being due to the pyrites being oxidized in contact with air into free sulphuric acid (SO_4) and sulphate of iron ($FeSO_4$), and by the further fact that the ground water contained from 5 to 57 parts per million of sulphuric acid.

The same case is explained differently by Bretschneider. He maintains that the destruction of the cement mortar required that a sufficient amount of sulphuric acid should form directly upon and in the structure, and believed the acid dissolved in the ground-water was too weak for the purpose. He assumed that the sulphuretted hydrogen contained in the ground-water, which is abundant in the peat, rises into the pores of the damp soil around the structure, and is there first converted into sulphur, as above mentioned, and then, after being exposed to more air and more moisture, there is a further conversion into sulphuric acid, when adjoining the structure or when absorbed into the same. It will be seen that in Osnabruck, the disintegration resulted from acid peaty water and also from sulphuretted hydrogen gas.

Structures in Charlottenburg have been protected against injury from sulphuric acid and other organic acids in peat or similar soils by a complete covering of three layers of asphalt paper.

The foregoing data seem to indicate the following inferences:

1.—When the immediate agent of destruction is carried by water, disintegration will be found below the permanent water surface. If such water is flowing inside of a structure, as in a sewer (acid or alkali factory waste), the disintegration will be inside and as far as the water penetrates the material. If the water is ground-water in alkali soil, swamp or peat, the disintegration will be on the outside (Great Falls and Osnabruck), and chiefly between high and low ground-water levels, and may penetrate porous material toward the inside of the structure.

2.—When, on the other hand, the agent of destruction is caused by gases (generally sulphuretted hydrogen) arising from waters, whether on the outside (Osnabruck) or the inside (Los Angeles and Berlin) of a structure, the disintegration will take place above the permanent water surface.

Methods and Cost of Calking and Grummeting Joints in Cast Iron Lining of the Hudson River Tunnels, Pennsylvania R. R.*

Details of the metal lining used are given in another column of this issue and the methods of erecting this lining were described in our issue of May 18, 1910.

After the metal lining had been built completely across the river in both tunnels, the work of making it water-tight was taken up. This consisted in calking into the joints between the plates a mixture of sal-ammoniac and iron borings which set up into a hard rusty mass, and in taking out each bolt and placing around the shank under the washer at each end a grummet made of yarn soaked in red lead. These grummets were made by the contractor on the works, and consisted of three or four strands of twisted hemp yarn, known as "lath yarn," making up a rope-like cross-section about ¼-in. in diameter. Usually, one of these under each washer was enough, but in wet gravel, or where bolts were obliquely in the bolt-holes, two were used at each end. After pulling the grummets in, all the nuts were pulled up tight by wrenches about 3 ft. long, with two men on one wrench. Bolts were not passed as tight unless the nut resisted the weight of an average man on a 2½-ft. wrench.

Before putting in the calking mixture, the joints were carefully scraped out with a special tool, cleaned with cotton waste, and washed with a stream of water. The usual mixture for sides and invert was about 2 lbs. of sal-ammoniac and 1 lb. of sulphur to 250 lbs. of iron filings or borings. In the arch, 4 lbs. of sal-ammoniac and 3 lbs. of sulphur to 125 lbs. of filings was the mixture. A small hand-hammer was used to drive the calking tool, but, in the sides and invert, air hammers were used with some advantage. The success of work of this kind depends entirely on the thoroughness with which the mixture is hammered in; and the inspection, which was of an exceedingly monotonous nature, called for the greatest care and watchfulness on the part of the Company's forces, especially in the pocket iron, where each bolt had to be removed, the calking done at the bottom of the pockets put in, the bolts replaced, and the rest of the pockets filled. The results have been satisfactory, as the leakage under normal air and prior to placing the concrete averaged about 0.14 gal. per lin. ft. of tunnel per 24 hours, which is about 0.0035 gal. per lin. ft. of joint per 24 hours. With each linear foot of joint is included the leakage from 1.27 bolts. Afterward, when the concrete lining was in, the leakage was found to be about 0.05 to 0.06 gal. per lin. ft. of tunnel per 24 hours, which compares favorably with the records of other lined tunnels. The typical gang employed on this work was as follows:

	Per day.
In Pocket Iron—	
1 General foreman at	$5.00
1 Mixer at	3.00
1 Nipper at	3.00
5 Caulkers at	3.00
10 Grummeters at	3.00
In Pocketless Iron—	
1 General foreman at	5.00
1 Mixer at	3.00
1 Nipper at	3.00
3 Caulkers at	3.00
12 Grummeters at	3.00

The average amount of calking and grummeting done per shift with such a gang was (with pocketless grooves), 348 lin. ft. of joint and 445 bolts grummeted; and in pocket iron: 126 lin. ft. of joint and 160 bolts grummeted.

*Extract from "The New York Tunnel Extension of the Pennsylvania R. R. The North River Tunnels," by B. H. M. Hewett and W. L. Brown. Proceedings American Society of Civil Engineers, Vol. xxxvi, p. 690.

Cost of Clearing Land.—The following method was employed in clearing land of Douglas for stumps. A gin pole was erected in the middle of a 15 to 20-acre tract and a 60 H. P. logging engine is anchored near the outside of the plot. A 1⅛-in. cable was passed through the pulley at the top of the gin pole and hitched to the stumps in turn, each of which was hauled to the big pile which soon surrounded the base of the pole. When all the stumps had been drawn to the pile, the whole was fired and the small refuse cleaned up and burned before. The cost of operating one machine for a week, during which time an average of four acres was cleared, was as follows:

Engineer, per week	$ 23.00
Fireman	12.00
Hook tender	24.00
Assistant tender	21.00
Signalman	18.00
Line assistant	21.00
Shovelman	12.00
Laborer	12.00
Water team	16.00
Wood, 15 cords, at $3.80	57.00
Powder	200.00
Dynamite	15.00
Fuse	7.00
Caps	1.00
Total for four acres	$439.00

Cost per acre, $109.75.

Added to the above is the cost of slashing the small growth which is put at $50 an acre, and the final gleaning which can usually be done for $10 an acre. This makes a grand total of $169.75 per acre for making the land ready for grading, or in the case of agriculture, ready for plowing. About two days was usually taken in moving from one plot of land to another, including the setting up of the gin pole, anchoring and making ready for starting. There is a small cost which should be allowed for burning the piles amounting to nearly $10 an acre. The cost of plant was as follows:

Sixty horsepower donkey engine	$3,750.00
1,300 feet 1¼-in. wire cable	400.00
4,000 feet ⅝-in. haul-back rope	300.00
Other sundries	100.00
Total	$4,550.00

These data are compiled from the *Canadian Engineer* for Jan. 28, 1910.

The Otis Co. of Palmer, Mass., has applied to the County Commissioners at Springfield, Mass., asking for permission to construct a dam across the Chicopee River, to be used in connection with a power house. It is proposed, according to the plans and specifications of the company, to erect the dam about one-eighth of a mile west of the company's mills, in the village of Three Rivers, in the town of Palmer.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Method and Cost of Constructing Three Short-Span, Single-Track Concrete Arch Bridges, Lake Champlain & Moriah Railroad.

The following costs are for constructing three reinforced concrete arch railway bridges in the northern part of New York by company forces. The prices of labor and materials were as follows:

Common labor, per day	$1.30
Carpenter foreman, per day	3.00
Boss carpenter, per day	[illegible]
Common carpenters, per day	1.75
Stationary engineer, per day	2.00
Foreman reinforcement, per day	2.00

A 10-hour day was worked for five days and a nine-hour day on Saturday. Tailings were used for concrete aggregate and cost only the freight and labor for loading, both of which are included in the labor costs given.

Lumber for forms cost $18 per M. ft. B. M. unplaned; the planing was done on the job and is included in the labor costs for forms. Cement cost $1.20 per bbl. after deducting credit for return of bags.

Bridge 1.—The plans for this bridge are shown by Fig. 1. It will be noted that it was founded on earth and required a spread footing. The pressure on foundation bed fell within 3 hrs. per square foot. The bridge contained 560.7 cu. yds. of concrete and was estimated to cost $7,000. The actual itemized cost was as follows:

Item.	Total.	Per cu. yd. concrete.
Temporary constructions—		
Materials	$ 10.51	$0.019
Labor	255.42	0.455
Miscellaneous	525.27	0.936
Total	$ 791.20	$1.410
Excavation		
Materials	$ 4.12	$0.001
Labor	374.94	0.668
Total	$ 379.06	$0.669
Forms		
Materials	$ 923.95	$1.647
Labor	1,228.92	2.191
Total	$2,152.47	$3.838
Mixing Concrete		
Materials	$ 55.19	$0.098
Labor	251.73	0.449
Total	$ 306.92	$0.547
Placing Concrete		
Materials	$ 135.20	$0.241
Labor	242.51	0.432
Total	$ 377.71	$0.673
Reinforcing		
Materials	$ 397.37	$0.708
Labor	198.34	0.354
Total	$ 595.71	$1.062
Cement	$ 780.75	$1.392
Superintendence	312.50	0.557
A round total	$5,696.72	$10.146

The concrete work proper, therefore, cost as follows per cubic yard:

Forms	$3.838
Mixing	0.547
Placing	0.673
Reinforcement	1.062
Cement	1.392
Total	$7.512

Superintendence prorated say $0.445

Grand total $7.957

In comment on these figures it may be noted that the item "materials" for forms includes the lumber used in trestles. Referring to "miscellaneous" charges under "preliminary construction," $262.23 of the total were paid for specifications and plans, or 4.6 per cent of the total cost. Superintendence cost 5½ per cent of the total.

Bridge 2.—The plans for this bridge are shown by Fig. 2. It is a much simpler structure than Bridge 1, being founded on rock and having plain abutment and wing walls. A feature of the design is the expansion joint placed across the barrel of the arch about mid length. The bridge contained 1,804 cu. yds. of concrete and its estimated cost was $10,500. The actual itemized cost was as follows:

Item.	Total.	Per cu. yd. concrete.
Temporary Construction		
Materials	$ 60.07	$0.033
Labor	915.72	0.508
Miscellaneous	796.10	0.441
Total	$1,771.90	$0.982
Excavation		
Materials	$ 27.20	$0.015
Labor	411.84	0.228
Total	$ 439.04	$0.243
Forms		
Materials	$ 965.91	$0.535
Labor	1,568.76	0.869
Total	$2,534.67	$1.404
Mixing Concrete		
Materials	$ 514.10	$0.285
Labor	572.12	0.316
Total	$1,086.22	$0.601
Placing Concrete—		
Materials	$ 31.25	0.017
Labor	$34.09	0.462
Total	$ 865.34	$0.479

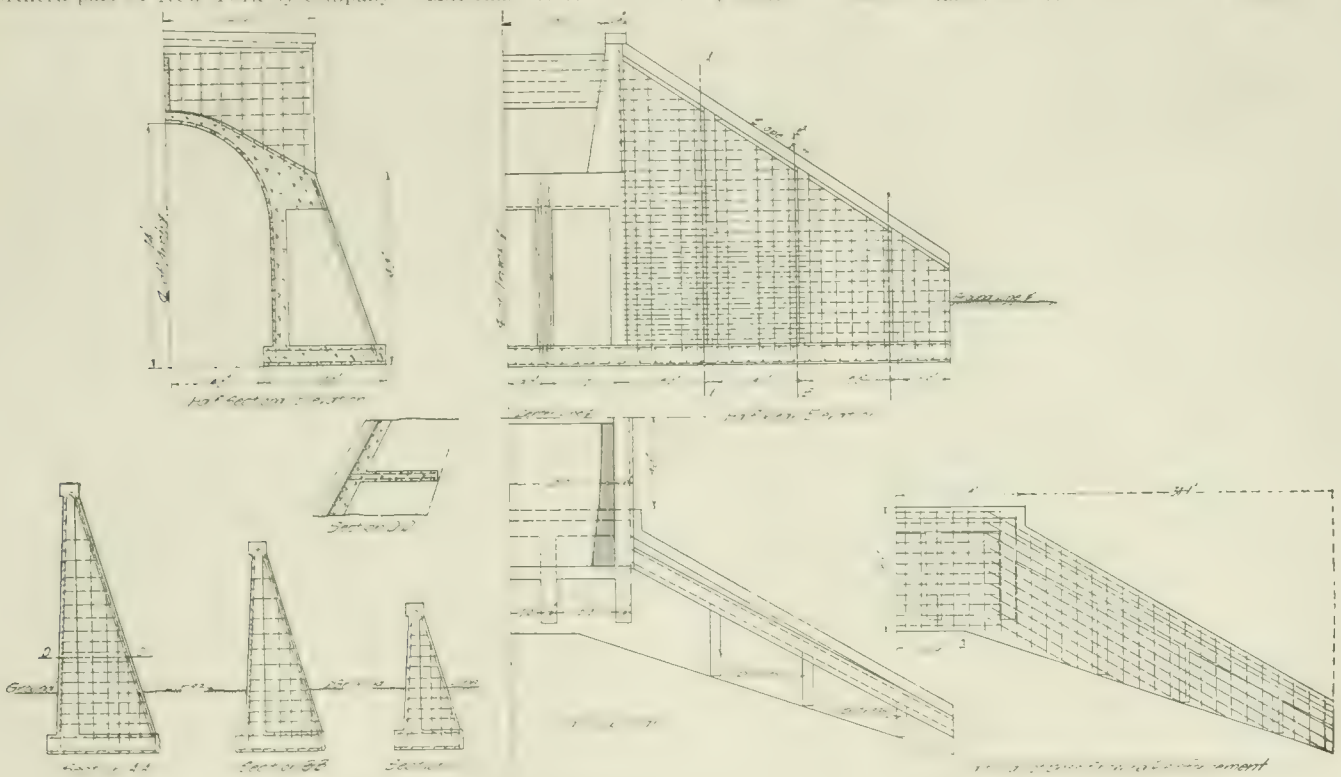

Fig. 1—Concrete Arch Bridge No. 1, Lake Champlain & Moriah R. R.

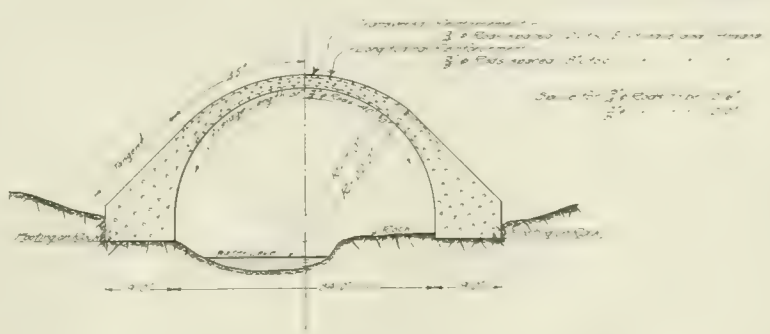

Fig. 2—Section of Concrete Arch Bridge No. 2, Lake Champlain & Moriah R. R.

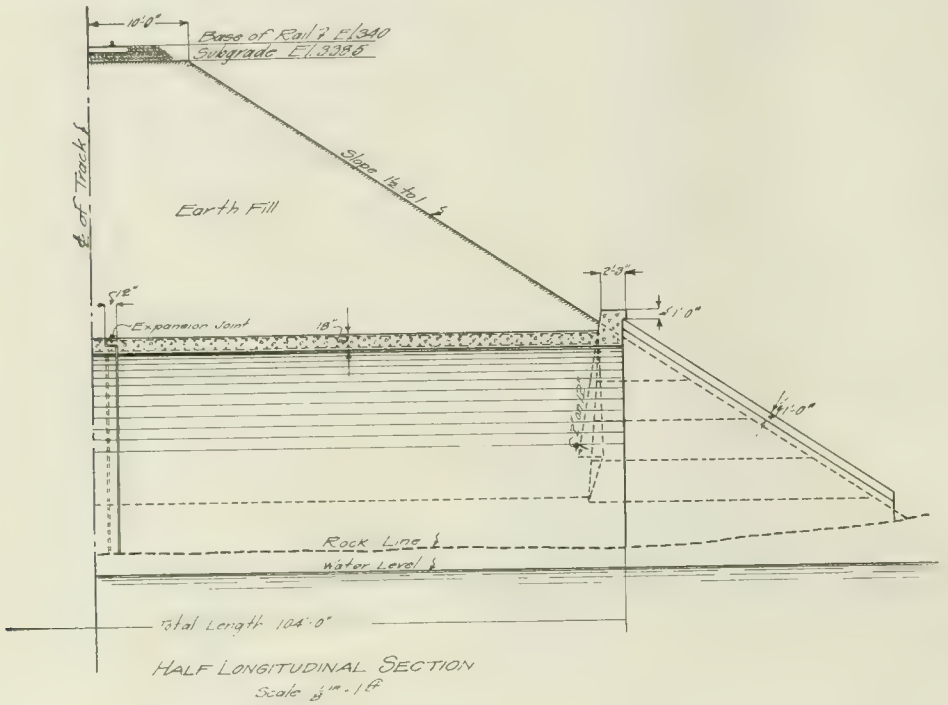
Reinforcing—		
Materials	$ 210.12	$0.116
Labor	56.70	0.031
Total	$ 266.82	$0.147
Cement		
Materials	$1,675.40	$0.928
Labor	19.91	0.011
Total	$1,695.31	$0.939
Superintendence	$ 538.49	$0.299
Grand total	$9,197.79	$4.044

In the above items "materials" for forms include trestle lumber and "miscellaneous" charges include $262.23 for plans and specifications. The charge for plans and specifications was 2.85 per cent and the cost of superintendence was 5.85 per cent of the total cost. The influence of complexity of forms on form costs and cost of placing concrete is indicated by comparing these costs for Bridges 1 and 2.



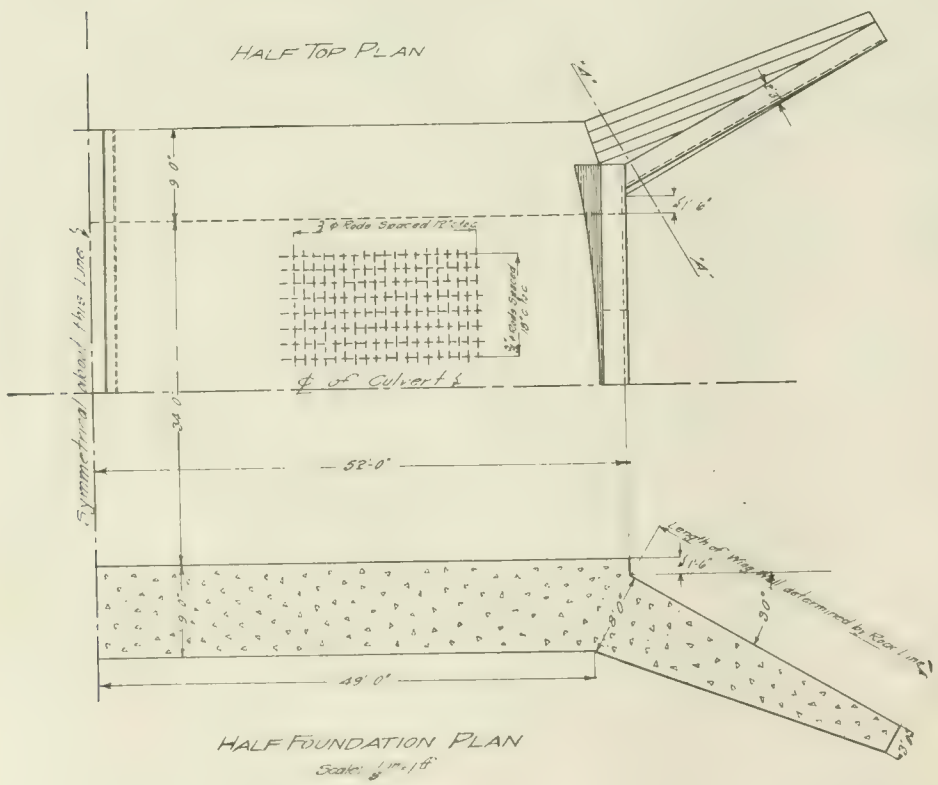


Fig. 3—Details of Concrete Arch Bridge No. 2, Lake Champlain & Moriah R. R.

The concrete work proper, therefore, cost as follows per cubic yard:

Forms	$1.404
Mixing	0.601
Placing	0.479
Reinforcing	0.117
Cement	0.939
Total	$3.540
Superintendence prorated say	0.225
Grand total	$3.795

Bridge 3.—The plans for this bridge are shown by Fig. 3. It is founded on rock just below the surface, with plain abutment and wing walls. A notable feature of the design is the extension upward of the abutment walls to form a cross wall between spandrel walls and the bracing together of the spandrel walls by two intermediate diaphragm walls as shown by the drawings. There is an expansion joint across the spandrel walls over the center pier. This bridge contained 1320.7 cu. yds of concrete and was estimated to cost $7,500. The actual itemized cost was as follows:

Item.	Total.	Per cu. yd. concrete.
Temporary Construction—		
Materials	$ 34.71	$0.026
Labor	186.38	0.141
Miscellaneous	538.66	0.408
Total	$ 759.75	$0.575
Excavation—		
Materials	$ 3.77	$0.003
Labor	797.57	0.603
Total	$ 800.84	$0.606
Forms—		
Materials	$ 912.51	$0.691
Labor	1,036.49	$0.785
Total	$1,949.00	$1.476
Mixing Concrete—		
Materials	$ 487.50	$0.369
Labor	678.04	0.513
Total	$1,165.54	$0.882
Placing Concrete—		
Materials	$ 1.05	$0.001
Labor	510.19	0.386
Total	$ 511.24	$0.387
Reinforcing—		
Materials	$ 396.83	$0.300
Labor	45.88	0.035
Total	$ 442.71	$0.335
Cement	$1,221.20	$0.924
Superintendence	$ 176.78	$0.134
Grand total	$7,027.06	$5.319

The concrete work proper, therefore, cost as follows per cubic yard:

Forms	$1.476
Mixing	0.882
Placing	0.387
Reinforcing	0.335
Cement	0.924
Total	$4.004
Superintendence prorated say	0.100
Grand total	$4.104

As with bridges 1 and 2, materials for forms include lumber used for trestles. The cost for plans and specifications was $262.23, and is included under "miscellaneous" preliminary construction charges. Plans and specifications cost 3.7 per cent and superintendence cost 2.5 per cent of the total cost.

The bridges described were designed by the firm of Wm. Barclay Parsons under the direction of Mr. Eugene Klapp of that firm. We are indebted to Mr. Klapp for the data from which this article has been prepared.

Method of Inspecting and Testing Cement for the Louisville Sewer Work with Costs.

The following methods are employed at the testing laboratory of the Commissioners of Sewers of Louisville, Ky., for inspecting and testing the large amounts of cement to be used in the construction of that city's new $4,000,000 sewer system.

Sampling.—Each lot of cement is tagged at the time samples are taken. The practice of tagging has varied according to the character of the work, and the location of storehouses and other conditions. Upon small work where the cement is taken from the storehouse and delivered onto the work in small lots, it has been found advisable to tag each bag. This is done as the cement is unloaded from the car or the team into the storehouse, at which time samples are taken for the laboratory. After acceptance, cement is taken from the storehouse to the work, as required, and the inspector upon the work, having been informed of the identification number of the lots which have been passed or rejected, knows from the tags upon the bags whether or not the cement has been tested and accepted. Upon the larger work, where the contractor stores his cement in warehouses from which it is used exclusively for but one of his contracts and which are located close to the site of the work, it has been necessary to use only sufficient tags to identify each individual lot as the inspector is able to visit the warehouse at frequent intervals and thus keep under his personal supervision the work of removing the cement from storage.

Rejections.—Of the whole number of carloads of cement tested (825 car loads or 146,437 bbls. up to Dec. 31, 1909) 74 or about 9

per cent, have been rejected for the following reasons:

62 carloads for quick setting.
5 carloads for coarse grinding.
6 carloads for retrogression in strength.
1 carload for low specific gravity and excess of sulphuric anhydride.

In each case when cement has been indicated by the tests to be of inferior quality, duplicate tests are at once commenced to make sure that no errors have crept into the laboratory work. It is also customary to order retests whenever the results of tests appear questionable, even though they may warrant passing the cement. In some instances three or four additional tests have been made at the request of the manufacturers whose representatives have always been welcomed to observe the making of the duplicate tests, and to make such suggestions as they deemed pertinent.

The large number of rejections, due to quick setting, was apparently due to shipping of cement without due seasoning. While some of the samples gave a satisfactory test when brought to the laboratory, a rapid change went on, so that within a month after the arrival of the shipments they had so changed as to become quick-setting. In some cases samples of cement would set in as short a time as 3 or 4 minutes. The change that was going on within this cement is shown very clearly by tests of samples that were taken from different parts of the same bag in a number of instances. For example, a sample taken near the surface, which was more or less exposed to the atmosphere, set in six minutes, while another sample taken from the center of the same bag required 2 hours and 34 minutes in which to acquire the initial set. This entire shipment was rejected and a few tests were carried on afterward, one of which, two months later, showed that the cement was still unfit for use on account of the short time in which it acquired its initial set.

In view of the importance of uniform methods and proper conditions in the laboratory, special attention has been given to securing uniform results of tests. Whenever an opportunity has been afforded by a visit of an expert from the cement factories, during which he has made tests, his work has been duplicated by the regular laboratory force for the sake of comparing results. Table 7 shows the results of a series of tests upon one brand of cement, the tests being made in duplicate, one by a representative from the mills, the other by an assistant in the laboratory. It will be seen from this table that in the main the results obtained by each tester varied within reasonable limits and that those of the laboratory assistant and the representative of the mills agreed with each other fairly closely.

TABLE I. RESULTS OF DUPLICATE TENSILE STRENGTH MORTAR TESTS.
(Pounds.)

A 7 days Mortar (1-3)				B 7 days Mortar (1-3)

A—Represents Sewerage Commission Cement Tester.
B—Represents Cement Co.'s Chemist.

There is necessarily a variation in the results of the tests for tensile strength, both of neat cement and mortar, although with care and skill in manipulation the variations may be materially reduced. After making a large number of tests it has been decided that for the ordinary routine work of the laboratory the difference in strength between the highest and lowest tests of mortar briquettes, either 7 or 28 days old, shall not exceed 60 lbs. If this amount is exceeded, a new test is immediately started. In cases of special experiments, or shipments of cement, the quality of which is particularly doubtful, and other cases requiring great accuracy, judgment is based upon tests in which the limit of variation is materially less than that adopted for the ordinary routine of the laboratory.

Whenever tests of neat cement at the end of seven days show a tensile strength exceeding 800 lbs., a new test is at once started, experience having proven that in most cases, if the manipulation and conditions have been good, cement testing above 800 lbs. in 7 days will show retrogression in 28 days. In all cases at least 40 briquettes are made up from each car load tested, 8 for each period of time in case of both neat and mortar tests, and where the tests are made for the purpose of passing upon the quality of the cement, all results are booked and judgment passed upon the average. In experimental work, 8 briquettes are made up for each test of tensile strength, but only those breaking within 5 per cent of the mean are used in the tabulations.

Storage to Prevent Quick Set Test and Lumpy Cement.—The specifications require that the contractors shall hold cement in storage long enough to allow for tests of 28 days' duration. It was found, however, during the winter of 1908 and 1909, that in several of the warehouses the dampness of the atmosphere had penetrated so as to cause the cement to become somewhat lumpy. In some cases this was due largely to the fact that doors and windows had been left open, allowing the damp air to enter freely; but it was also found that in other warehouses in which the cement seemed to be well protected, there was also some deterioration in quality. Permission was given to contractors, therefore, to cut down their storage during the winter and spring, so that the cement might be used in a shorter time if found satisfactory at the end of the 7-day test. Cements, however, which upon the results of the 7-day tests did not give promise of fulfilling all the requirements, were held for the full 28-day test.

Samples of the lumps of cement were tested and in some cases were found to have lost nearly all of their original strength. The fine material in the same bags was found to be of good quality and was allowed to be used after the lumps had been screened out. There appeared to be no difference in the effect of the dampness upon the different brands of cement in storage, all of them seeming to suffer to about the same extent.

The cost per barrel of testing including entire cost of equipment has been 4.2 cts. Charging 66⅔ per cent of the cost of equipment reduces the cost of testing per barrel to 3.7 cts.

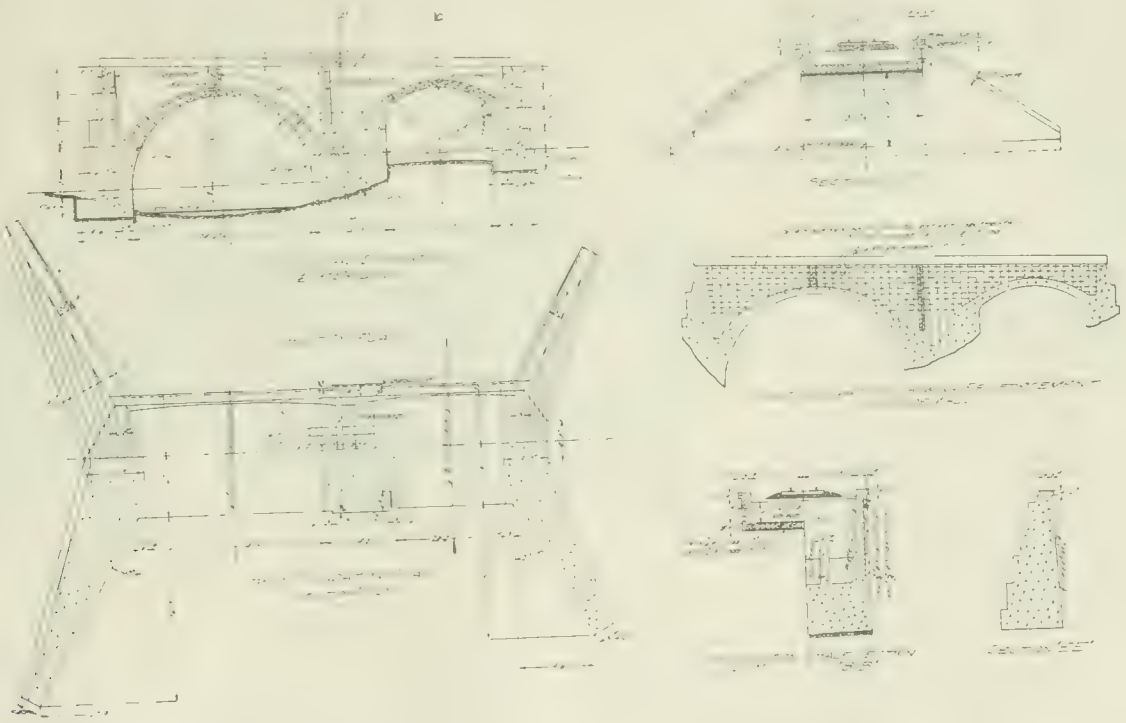

Fig. 1—Concrete Arch Bridge No. 3, Lake Champlain & Moriah R. R.

The National Rys. of Mexico, James M. Reid, Chief Engineer, City of Mexico, according to reports, will coon resume construction of the short line to connect Tampico with the City of Mexico. At the time the Mexican Central Railroad passed into the hands of the government, two years ago, it was constructing the Tampico-City of Mexico line. It had about 50 miles graded and some track laid from a point on its line some 25 miles from Tampico. Construction ceased when the road became a part of the National Railways of Mexico. The survey for this line calls for a low-grade route, notwithstanding the fact that it must mount from sea level nearly 8,000 ft.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Drilling Records at the Crushed Stone Plant of Dolese & Shepard, Chicago.

In our article of June 1, describing the stone crushing plant of the Dolese & Shepard Co., at Gary, Ill., we published a table showing the results of a 30-day run of six well drilling machines. We wish to add here, that the holes for the well-drilling machines are made in one row from 18 to 22 ft. back from the ledge and are spaced on an average of 10 ft. apart, that is not less than 8 ft., or more than 12 ft. The spacing for the tripod air drills is 8 ft. and two rows are made, the second row being not more than 18 ft. from the ledge.

We also wish to make a note in connection with the above mentioned article with special regard to the washing plant shown. This plant was designed by the J. C. Buckbee Co., engineers, of Chicago. The main plant was also designed and built under supervision of this firm of engineers.

Method and Cost of Excavating a Mine Shaft by Raising.

The following data on methods and cost of opening a mine shaft by raising or excavating from the bottom upward are given in the *Mining and Scientific Press* for June 4, 1910.

The shaft is a five-compartment shaft for the Giroux Consolidated Mines Co., Ely, Nev. The size of the new shaft, which is in limestone, is 17 ft. 2¾ ins. x 10 ft., measured inside the timbers. A cage compartment is 10 ft. x 5 ft. 8 ins.; two skip compartments are each 5½ x 5 ft.; two others, for pipes and ladder-way, are each 5 ft. x 4 ft. ½ in. In opening this shaft 948 ft. of the work was done by raising, the starting-point having been on a cross-cut that had been driven from the 1,000-ft. station of the Alpha shaft. After cutting a 14x18-ft. station and installing an air-hoist, the raising began July 5, 1909. The raise was made 13x12 ft. in the clear, was supported by timbering in square sets, which divided the space into four compartments, the one at each end being used as a chute. The chute lining was braced by 8x8-in. stiffners. The lagging on the wall-sides of the cage, ladder, and pipe compartments was likewise stiffened by 4x6-in. timbers. Everard Arnold, construction engineer at this property, in describing this work says: "Over the two center compartments the last two sets were always bulkheaded with 8x12-in. timbers, and from the lower bulkhead the cage sheave-wheel was suspended. After a round of holes had been blasted and the loose ground picked down, the average time required to hoist, plumb, and block a set of timbers was 2 hr., although the operation was occasionally performed in 1 hr. 30 mins. When possible the chutes were kept almost full in order to minimize the chances of injury should men have happened to fall. For the purpose of protecting the lower timbers of the chute, breakers or platforms of 10x10-in. timbers were spiked to the girts at intervals of seven sets. On these breakers the rock piled up and formed its own slope. Trouble was often caused by large rocks dropping into the chute, and on reaching the gate they would have to be blasted."

The air-hoist was used in raising timbers from the foot of the raise; and two pressure blowers, running in tandem, served to keep up ventilation. When the raise reached a place as high as the 770-ft. level from the Alpha shaft, a connection was made and this level then served for the removal of rock and as an entrance to the raise instead of the 1,000-ft. level. In accomplishing the 948 ft. of raising, three shifts per day for 180 days were required, the work having been in direct charge of William Hogan, mine superintendent. The raise cost $71.21 per foot, classified as follows:

Item.	Per ft.
Raising	$16.64
Trimming	5.09
Timber framing	1.56
Teaming	0.54
Hoisting	15.15
Air compresson	10.09
Supplies	17.24
Blacksmithing	1.59
Machine shop	0.11
Prop. underground exp.	3.11
Total	$71.21

General underground expenses, $3.44. As it is estimated that 75 per cent of the timber used in raising will be available for other work, the ultimate cost of the raise will be thus reduced to $63.71 per foot.

The part of the shaft from the surface to a depth of 15 ft. was opened by sinking, so that the collar-set and three shaft-sets could be installed and concreted. With the raise finished to the surface, and the installation of temporary hoisting equipment, sinking was commenced at the 1,000-ft. station, and a compartment 10x5 ft. 8 in. was sunk 200 ft. and this was temporarily timbered. After cutting a sump below the 1,200-ft. station the lower 200 ft. of the shaft was enlarged to the size of the upper part by raising. A pump station is to be excavated at the

A new piece of equipment to be tried at these mines in sinking is a Hulett grab-bucket for handling debris. The bucket, to be suspended from a skip, is designed to take up the rock from the bottom of the shaft, after the blast, then to be hoisted to the first station above, and there dumped into a loading pocket. General Manager Frank P. Mills plans to experiment with it as a possible means of more economical shaft sinking.

Time and Material Costs of Excavating Thirty-Five Cu. Yds of Rock in Trench Bottom.

The trench was 2½ ft. wide and 5¾ ft. deep and the rock, a bastard granite, was found in the bottom of an average depth of 2¾ ft. The drilling was done by hand using 1¼-in. drills, 1 man holding and 2 men striking with 8-lb. hammers. A total of 96 ft. of hole was drilled or 3.2 ft. per cu. yd. of work. The time required was 3.1 hours per lin. ft. of hole. The time work of excavating 35 cu. yds. was:

Item.	Per cu. yd.
297 hrs. drilling	9.92
126 hrs. mucking	3.43
Total	$13.35

The materials used were as follows:

Item.	Per cu. yd.
53 lbs. 60% dynamite, lbs.	1.5
Explosives	2.

A batch of 120 drills were sharpened, or 4 per cu. yd., or 1 per 0.75 ft. of hole drilled. The amount of explosive used per foot of hole was ½ lb. Labor estimating does not include backfills. The above data are furnished by Edward B. Roberts, Engineer-Contractor, Boston, Mass.

A Four-Wheel Scraper Holding 1 Cu. Yd.

While the ordinary "wheeler" is an economic tool for comparatively short haul work, its limit of distance is soon reached. Consequently a good many attempts have been made to build a "wheeler" that would approach a dump wagon in capacity, but usually the attempt has been without success. For more than three years, however, there has been in successful use a type of self-loading wagon, known as the "Maney four-wheeler." It differs from the ordinary wheel scraper not only in that its bowl or pan is mounted on four wheels, but in that the bowl is tilted backward when the load is dumped, as shown in Fig. 1. The mechanism for tilting the bowl in any desired position is simple, and is entirely in the control of the driver, who rides on a seat at the rear end of the four-wheeler. By means of levers he controls sprocket chains that mesh into sprocket wheels driven by the rear axle. Therefore it is the team and not the man that does the real work of dumping the bowl, as well as of inclining it in the proper position for loading. This makes it possible for the driver to load and dump a cubic yard or more of earth, for the bowl has a capacity of 31 cu. ft., as it measures 25x45x48 ins.

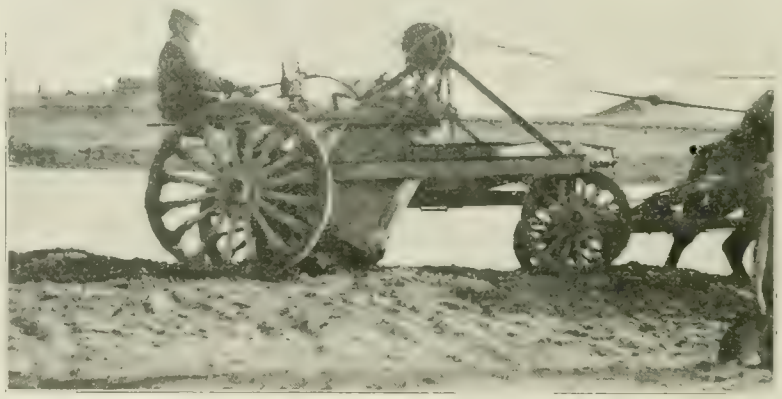

Fig. 1—Maney Four Wheeled Scraper.

At the rear end of the bowl is a gate that prevents the spilling of earth while loading or traveling to the dump. By regulating the backward inclination of the bowl during dumping, the earth can be spread in layers of any desired thickness, or it can be dropped in a heap.

Overwinding of the sprocket chains is prevented by a simple automatic trip, and, indeed, all possible causes of difficulty or breakage have been provided for by the inventors, who themselves were contractors and perfected the invention on their own jobs of earthwork.

We have before us a number of unusually good letters from contractors who have been using these four-wheelers on railroad, levee, reservoir, street, road and other work. From 2 to 4 head of stock are used to pull the loaded four-wheeler, but while loading a snap team of 2 to 4 horses is used, depending on the character of the earth. We are informed that the Maney four-wheeler weighs no more than a dump wagon, hence the number of animals required to pull it when loaded should be no

more than on a loaded dump wagon traveling over soft earth roads. One western contractor gives a cost of 7 cts. per cu. yd. for short hauls; another mentions 10 cts. as being his cost. Another built 170,000 cu. yds. of reservoir and embankment, mostly hardpan, for 14 cts. per cu. yd. (including 1 ct. for freight in moving the plant to and from the job). This

Fig. 2—View Showing Traction Engine Hauling Two Loaded Maney Scrapers.

gives a net cost of 13 cts. per cu. yd. for the work, and as the average haul was 400 ft. this was a good record for 8-hour day work at high wages.

Captain O. W. Bell, Const. Q. M., U. S. A., states that a 16-HP. traction engine will load a scraper in 1¼ mins., when the traction engine is used instead of a snap team. This would mean 480 scraper loads in 10 hours. He used three horses to haul each four-wheeler, and states that the loads averaged 29 cu. ft.

Recently certain contractors have been using traction engines not only for loading but for hauling these Maney scrapers. Fig. 2 shows an engine taking two loaded scrapers to the dump. Under favorable conditions, four or more Maneys have been thus handled by a traction engine. When a traction engine is used it is not necessary to plow the ground, which is an added element of economy. In building embankments that require rolling, like dykes and reservoirs, it has been found that grooved rollers can be dispensed with, for the wheels of the four-wheeler are more effective. The axle of the rear wheels is made longer than that of the front wheels, so that the wheels do not track. This adds greatly to the effectiveness of the Maney as a roller, and it also keeps the road between the "pit" and the "dump" in good condition.

The manufacturers of this self-loading wagon, or Maney four-wheeler are the Barron & Cole Co., Barron Bldg., 200 West Broadway, New York City.

Road Dragging With Automobiles. Automobiles have been used at Madison, S. Dak., for hauling a King road drag for maintaining Main St. at that city. Mr. C. A. Trimmer, City Engineer, informs us that this street is a common earth road having a small amount of local gravel mixed with the black loam surface soil and while it is well crowned and graded and is very solid, it will, after a hard rain or during a wet period, be cut up slightly on the surface and would be left rather rough upon drying out. The use of a king drag at the proper time smoothes the surface and leaves a very satisfactory roadway. This work has heretofore been done with teams, but in this instance two automobiles were secured, a pulley block attached to the chain on the drag and a piece of 1-in. rope about 30 ft. long passed through the block and one end attached to the rear axle of each automobile, in which manner the work was accomplished.

Design of Tunneling Shields and of Steel Lining Used in Constructing the River Sections of the Pennsylvania R. R. Hudson River Tunnels.*

TUNNELING SHIELDS.

During the period in which the original contract drawings were being made, considerable attention was given to working out detailed studies for a type of shield which would be suitable for dealing with the various kinds of ground through which the shield-driven tunnels had to pass. This was done in order that, when the contract was let, the engineer's ideas of the requirements of the shields should be thoroughly crystallized, and so that the contractor might take advantage of this long-thought-out design, instead of being under the necessity of placing a hurried order for a piece of plant on which so much of the safety as well as of the speed of his work depended. Eventually, the contractor took over these designs as they stood, with certain minor modifications, and the shields as built and worked gave entire satisfaction. The chief points held in view were ample strength, easy access to the working face combined with ease and quickness of closing the diaphragm, and general simplicity. A clear idea of the main features of the design can be gathered from Fig. 1.

The interior diameter of the skin was 2 ins. greater than the external diameter of the metal lining of the tunnel, which was 23 ft. The skin was made up of three thicknesses of steel plate, a ¾-in. plate outside and inside, with a ⅝-in. plate between; thus the external diameter of the skin was 23 ft. 6¼ ins. The length over all (exclusive of the hood, to be described later) was 15 ft. 11 7/16 ins. The maximum overlap of the skin over the erected metal lining was 6 ft. 4½ ins. and the minimum overlap, 2 ft.

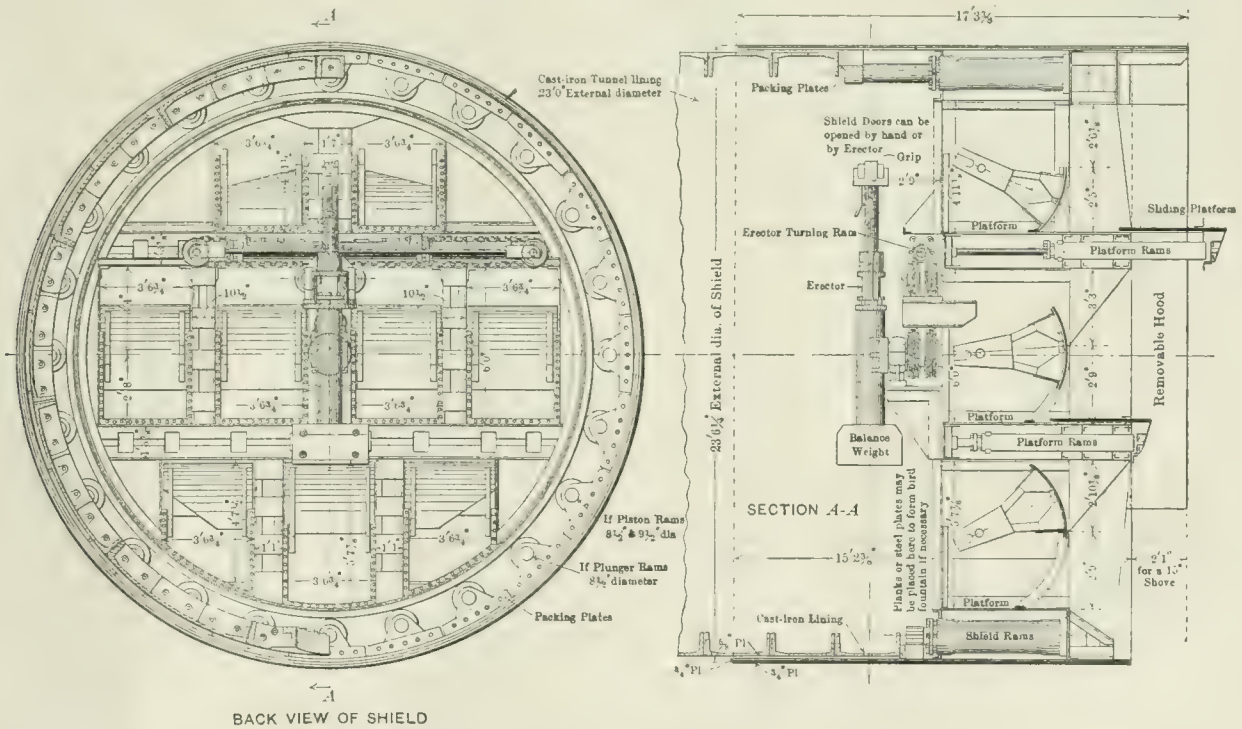

Fig. 1—Proposed Shield for Subsegment Tunneling.

There were no inside or outside cover-plates, the joints of the various pieces of skin plates being butt-joints covered by the overlap of adjoining plates. All riveting was flush, both inside and outside. The whole circumference of each skin plate was made up of eight pieces, each of which extended the entire

*Rearranged from "The New York Tunnel Extension of the Pennsylvania R. R. The North River Tunnels," by B. H. M. Hewett and W. L. Brown. Proceedings American Society of Civil Engineers, Vol. XXXVI, p. 690.

length of the shield, the only circumferential joint on the outside being at the junction of the removable cutting edge (or of the hood when the latter was in position) with the shield proper.

Forward of the back ends of the jacks, the shield was stiffened by an annular girder supporting the skin, and in the space between the stiffeners of which were set the 24 propelling rams used to shove the shield ahead by pressure exerted on the last erected ring of metal lining.

To assist in taking the thrust of these rams, gusset-plates were placed against the end of each ram cylinder, and were carried forward to form level brackets supporting the cast-steel cutting edge segments. The stiffening gussets, between which were placed the rams, were also carried forward as level brackets for the same purpose. The cast-steel segmental cutting edge was attached to the front of the last mentioned plates.

The interior structural framing consisted of two floors and three vertical partitions, giving nine openings or pockets for access to the face; these pockets were 2 ft. 7 ins. wide, the height varying from 2 ft. 2 ins. to 3 ft. 4 ins. according to their location. The openings were provided with pivoted segmental doors, which were adopted because they could be shut without having to displace any ground which might be flowing into the tunnel, and while open their own weight tended to close them, being held from doing so by a simple catch.

For passing through the varied assortment of ground before entering on the true subriver silt, it was decided to adopt the forward detachable extension, or hood, which has so often proved its worth in ground needing timber for its support. This hood extended 2 ft. 1 in. beyond the cutting edge, and from the top down to the level of the upper platform. Additional pieces were provided by which the hood might have been brought down as far as the lower platform, but they were not used. Special trapezoidal steel castings formed the junction between the hood and the cutting edge. The hood was in nine sections, built up of two ¾-in. and one ⅝-in. skin plates, as in the main body of the skin, and was supported by bracket plates attached to the forward ends of the ram chambers. The hoods were bolted in place, and were removed and replaced by regular cutting-edge steel castings after the shields had passed the river lines.

The floors of the two platforms, of which there were eight, formed by the division of the platforms by the upright framing, could be extended forward 2 ft. 9 ins. in front of the cutting edge, or 8 ins. in front of the hood. This motion was given by hydraulic jacks. The sliding platform could hold a load of 7,900 lbs. per sq. ft., which was equal to the maximum head of ground and water combined.

The weight of the structural portion of each shield was about 135 tons.

The remainder of the shield was the hydraulic part, which provided its motive force and gave the power to the segment erector. The hydraulic fittings weighed about 58 tons per shield, so that the total weight of each shield was about 193 tons. The hydraulic apparatus was designed for a maximum pressure of 5,000 lbs. per sq. in., a minimum pressure of 2,000 lbs., and a test pressure of 6,000 lbs. The actual average pressure used was about 3,500 lbs. per sq. in.

There were 24 shoving rams, with a diameter of 8½ ins. and stroke of 38 ins. The main ram was single-acting. The packings could be tightened up from the outside without removing the ram, a thing which is of the greatest convenience, and cannot be done with the differential plunger type. Some of the chief figures relating to the shield rams, with a water pressure of 5,000 lbs. per sq. in., are:

Forward force of one ram, lbs. 275,000
Forward force of 24 rams (all), lbs. 6,600,000
Forward force of 24 rams ..... 3,300 tons of 2,000 lbs.
Equivalent pressure per square inch of face, lbs. 105
Equivalent pressure per square foot of

Pull-back pressure on full area of ram, lbs. per sq. in..... 480

The rams developed a tendency to bend, under the severe test of shoving the shield all closed, or nearly so, through the river silt, and it is probable that it would have been better to make the pistons 10 in. in diameter instead of 8½ ins.

Each sliding platform was actuated by two single-acting rams, 3½ ins. in diameter and having a stroke of 2 ft. 9 ins. The rams were attached to the rear face of the shield diaphragm inside the box floors, and the cylinders were movable, sliding freely on bearings in the floor. The front ends of the cylinders were fixed to the front ends of the sliding platforms. The cylinder thus supported the front end of the sliding platform, and was designed to carry its half of the load on the platform. Some of the leading figures in connection with the platform rams, at a working pressure of 5,000 lbs. per sq. in., are:

Forward force of each pair of rams (in each platform), lbs.....96,000
Total area of nose of sliding platform, sq. ins. 1,060
Maximum reaction per sq. in. on nose, lbs. 90
Maximum reaction per sq. ft. on nose, lbs..13,040

Each shield was fitted with a single erector mounted on the rear of the diaphragm. The erector consisted of a box-shaped frame mounted on a central shaft revolving on bearings attached to the shield. Inside of this frame there was a differential hydraulic plunger, 4 ins. and 3 ins. in diameter and of 48-ins. stroke. To the plunger head were attached two channels sliding inside the box frame, and to the projecting ends of these the grip was attached. At the opposite end of the box frame a counterweight was attached which balanced about 700 lbs. of the tunnel segment at 11 ft. radius.

The erector was revolved by two single-acting rams fixed horizontally to the back of the shield above the erector pivot through double chains and chain wheels keyed to the erector shaft. The principal figures connected with the erector, assuming a water pressure of 5,000 lbs., per sq. in., are:

	Pounds.
Weight of heaviest tunnel segment.....	2,584
Weight of erector plunger and grip.....	616
Total weight to be handled by the erector ram	3,200
Total force in erector ram moving from center of shield.....	35,000
Total force in erector ram moving toward center of shield.....	27,500
Weight at 11-ft. radius which is balanced by counterweight	700
Maximum net weight at 11-ft. radius to be handled by turning rams.....	1,884
Total force of each rotating ram, at 5,000 lbs. per sq. in.....	80,000
Load at 11-ft. radius, equivalent to above	3,780

When the shield was designed, a grip was also designed by which the erector could handle segments without any special lugs being cast on them. A bolt was passed through two opposite bolt holes in the circumferential flanges of a plate. The grip jaws closed over this bolt and locked themselves. The projecting fixed ends of the grip were for taking the direct thrust on the grip caused by the erector ram when placing a segment.

It happened, however, that there was delay in delivering these grips, and, when the shield was ready to start, and the grip was not forthcoming, Mr. Patrick Fitzgerald, the Contractor's Superintendent, overcame this trouble by having another grip made.

In this design also, a self-catching bolt is placed through the segment and the grip catches the bolt. In simplicity and effectiveness in working, this new design eventually proved a decided advance on the original one, and, as a result, all the shields were fitted with the new grip, and the original design was discarded.

The great drawback to the original grip was that the plate swung on the lifting bolt, and thus brought a great strain on the bolt when erecting a plate in the crown, whereas in the new one, the plate was held rigidly at right angles to the erector arm. The original design was able to handle both *A* and *B* segments, and key segments, without alteration; in the new design, an auxiliary head had to be swung into position to handle the key, but this objection did not amount to a practical drawback.

The operating floor from which the shield was controlled, and at which the valves were situated, was placed above the rams which rotate the erector, and formed a protection for them. The control of the shield rams was divided into four groups; the seven lower rams constituted one group, the upper five, another, and the six remaining on each side, the other two. Each group was controlled by its own stop and release valve. Individual rams were controlled by stop-cocks.

The control of the sliding platform rams was divided into two groups, of which all the rams on the upper floor made one, and all those in the lower floor, the other; here, again, each group had its own stop and release valve, and individual platforms were controlled by stop-cocks arranged in blocks from which the pipes were carried to the rams.

The in-and-out movements of the erector ram were controlled by a two-spindle, balanced, stop and release valve, controlled by a hand wheel. The erector rotating rams were controlled by a similar valve, with four spindles, also operated by a single hand-wheel. Both wheels were placed inside the top shield pockets, and within easy reach of the operating platform.

The hydraulic pressure was brought through the tunnel by a 2-in. hydraulic pipe. Connection with the shield was made by a flexible copper pipe, the 2-in. line being extended as the shield advanced.

TUNNEL LINING.

General Type.—The main ruling type adopted for the tunnels under the Hudson River and in the soft water-bearing ground for some distance on the shoreward side of the river lines, consists of two parallel metal-lined tunnels, circular in cross section, each tunnel being 23 ft. outside diameter, and the two tunnels 37 ft. apart from c. to c. The metal lining is of cast iron (except for a few short lengths of cast steel) and of the usual segmental type, consisting of "Rings" of iron, each ring being 2 ft. 6 ins. in length, and divided by radial joints into eleven segments, or "Plates," with one "Key," or closing segment, having joints not radial but narrower at the outside circumference of the metal lining than at the inside. The whole structure is joined, segment to segment, and ring to ring, by mild-steel bolts passing through bolt holes in flanges of all four faces of each segment. The joints between the segments are made water-tight by a calking or sal-ammoniac and iron borings driven into grooves formed for the purpose on the inner edges of the flanges. The clearances between the bolts and the bolt holes are also made water-tight by using grummets or rings of yarn smeared with red lead, having a snug fit over the shank of the bolt and placed below the washer on either end of each bolt. When passing through ground more or less self-sustaining, the space outside the iron lining (formed by the excavation being necessarily rather larger than the external diameter of the lining itself) was filled with grout of 1:1 Portland cement and sand forced by air pressure through grout holes in each segment. These holes were tapped, and were closed with a screw plug before and after grouting.

Having thus stated in a general way the main ruling features of the design, a detailed description of the various modifications of the ruling type will be given.

The two main divisions of the iron lining are the "ordinary" or lighter type and the heavy type. The details of the ordinary iron are shown in Fig. 2 which shows all types of lining. It was on this design that the contract was let, and it was originally intended that this should be the only type of iron used. The dimensions of the iron are clearly shown on the drawing, and it will be seen that the external diameter is 23 ft., the interior diameter, 21 ft. 2 ins., the length of each ring, 2 ft. 6 ins. and the thickness of the iron skin or web, 1½ ins. The bolt holes in the circumferential flanges are evenly spaced through the

circle, so that adjacent rings may be bolted together in any relative position as regards the radial joints, and, as a matter of fact, in the erection of the tunnel lining, all the rings "break joint," with the exception of those at the bore segments, as will be described later. This type of iron, when the original type was modified, came to be known as the ordinary pocketless iron; that is, the weight is of the ordinary or lighter type, in contradistinction to the heavier one, which later supplanted it, and the calking groove runs along the edges of the flanges and does not form pockets around the bolt holes, as did the groove in a later type.

Each ring is made up of eleven segments and a key piece. Of these, nine have radial joints at both ends, and are called *A* segments; two, called *B* segments, have a radial joint at one end and a non-radial joint at the other. The non-radial joint is placed next to the key, which is 12.25 ins. wide at the outside circumference of the iron and 12.50 ins. wide at the inside.

The web is not of uniform thickness. The middle part of each *A* and *B* segment is 1½ ins. thick; at the distance of 6 ins. from the root of each flange, the thickness of web begins to increase, so that at the root it is 2⅜ ins. thick. The web of the key plate is 1¾ ins. thick.

The bolts are of mild steel, and are 1½ ins. in diameter; there are 67 in one circumferential joint and 5 in each radial joint. As there are 12 such radial joints, there are altogether 60 bolts in the cross-joints, making a total of 127 bolts per ring.

This original type of ordinary iron was modified for a special purpose as follows: It was known that for some distance on either side of the river and especially at Weehawken, the tunnels would pass through a gravel formation, rather open, and containing a heavy head of water. It was thought that, by carrying the calking groove around the bolt holes, it would be possibe to make them more waterproof than by the simple use of the red-leaded grummets. Hence the "Pocket Iron" was adopted for this situation, the name being derived from the pocket-like recess which the calking groove formed when extended around the bolt hole. The details of this lining are shown on Fig. 2, and the iron (except for the pockets) is exactly like the pocketless type.

On the New York side, in both North and South Tunnels, two short lengths were built with cast-steel lining. This was done where unusual stresses were expected to come on the lining, namely, at the point where the invert passed from firm ground to soft, and also where the tunnels passed under the heavy river bulkhead wall.

The design was precisely the same as for the ordinary pocketless iron, and Fig. 2 shows the details. After the tunnels had entered into the actual under-river portion, several phenomena led to the fear that the tunnels, being lighter than the semi-liquid mud they displaced, might be subject to a buoyant action, and therefore a heavier type of lining was designed. The length of ring, number of bolts, etc., were just the same as for the lighter iron, but the thickness of the web was increased from 1½ to 2 ins., the thickness of the flanges was proportionately increased, and the diameter of the bolts was increased from 1½ to 1¾ ins. This iron was all of the pocketless type, shown in Fig. 2. Table I gives the weights of the various types of lining.

The weights in Table I are calculated by assuming cast iron to weigh 450 lbs. per cu. ft., and cast steel 490 lbs. In actual practice the "ordinary" iron was found to weigh a little more than the weights given, and the "heavy" a little less.

The silt in the sub-river portion averaged about 100 lbs. per cu. ft., so that the weight of the silt displaced by the tunnel was about 11,548 lbs. per lin. ft.

Taper Rings.—In order to pass around curves (whether horizontal or vertical), or to correct deviation from line or grade, taper-rings were used; by this is meant rings which when in place in the tunnels were wider than the standard rings, either at one side (horizontal tapers or "Liners"), or at the bottom ("Elevators").

In the original design a ½-in. taper was called for, that is, the wide side of the ring was ½ in. wider than the narrow side, which was of the standard width of 2 ft. 6 ins. As a matter of fact, during construction, not only ½-in., but ¾-in. and 1-in. tapers were often used.

These taper rings necessitated each plate having its own unalterable position in the ring, hence each plate of the taper ring was numbered, so that no mistake could be made during erection.

The taper rings were made by casting a ring with one circumferential flange much thicker than usual, and then machining off this flange to the taper. This was not only much cheaper than making a special pattern for each plate, but made it possible to see clearly where, and what, tapers were used in the tunnel.

Taper rings were provided for all kinds of lining (except the cast steel), and the lack of taper steel rings was felt when building the steel-lined parts of the tunnel, as nothing could be done to remedy deviations from line or grade until the steel section was over and cast iron could again be used. Table II gives the weights of the different kinds of tapers used.

Cast-Steel Bore Segments and Accessories.—The following feature of these tunnels is different from any hitherto built. It was the original intention to carry the rolling load independent of the tunnel, or to assist the support of the silt portion of the structure by a single row of screw-piles, under each tunnel, and extending down to firmer ground than that through which the tunnels were driven. Therefore, provision had to be made whereby these piles could be put down through the invert of the tunnel with no exposure of the ground.

This provision was afforded by the "Bore Segments," which are shown in detail in Fig. 3. There are two segments, called No. 1 and No. 2 respectively. These two segments are bolted together in the bottom of two adjacent rings, and thus form a "Pile Bore." As the piles were to be kept at 15-ft. centers, and as the tunnel rings were 2 ft. 6 ins. in length, it will be seen that, between each pair of bore-segment rings, there came four "Plain" rings. The plain rings were built up so that the radial joints broke from ring to ring, but with the bore-segment rings this could not be done, without unnecessarily adding to the types of segments.

The bore segments were made of cast steel, and were quite complicated castings, the principle, however, was quite simple. The segments provided an opening just a little larger than the shaft of the pile, the orifice being 2 ft. 7 ins. in diameter at the smallest (lowest) point, while the shaft of the pile was to be 2 ft. 5¼ ins. In order to allow of the entry of the screw-blade or helix of the pile, a slot was formed in the depth of Bore Segment No. 1, so that, when a pile was put in position above the bore, the blade, when revolved, would enter the slot and thus pass under the metal lining, although the actual orifice was only slightly larger than the pile shaft.

The wall of the pile orifice in Segment No. 2 was made lower than that in No. 1 so as to allow the blade to enter the slot in Segment No. 1. When the pile is not actually in process of being sunk, this lower height in No. 2 is made up with the removable "distance piece." This had a tongue at one end which engaged in a recess cast to take it in Segment No. 2 and was held in place by a key piece at the other end of the distance piece. Details of the distance piece and key are shown in Fig. 3.

The flanges around the pile bore were made flat and furnished with twelve tapped holes, six in Segment No. 1 and six in Segment No. 2, for the purpose of attaching the permanent arrangements in conjunction with which the pile was to be attached to the track system, independently of the tunnel shell, or directly to the tunnel. It was never decided which of these alternatives would be used, for, before this decision was reached, it was agreed that,

at any rate for the present, it was better not to put down piles at all.

To close the bore, the "Bore Plug" was used. This is shown in Fig. 3. It was of cast steel, and was intended to act as a permanent point of the screw-pile, that is, the blade section was to be attached to the bore plug, the distance piece and key were to be removed, and the pile was to be rotated until the blade had cleared the slot; the distance piece and key were then to be replaced and sinking resumed.

The plug was held in place against the pressure of the silt by the two "dogs," while the dogs themselves were attached to the tunnel, as shown in Fig. 3. The ends of the dogs, which rested on the flanges of the metal lining of the tunnel, were prevented from being knocked off the flanges (and thus releasing the plug) by steel clips.

It was expected that it might be desirable to keep the lower end of the piles open during their sinking, so that the bore plugs were not made permanently closed, but a seating was formed on the inner circumference of the plug, and on the seating was placed the "Plug Cover," made of cast iron, 18¾ ins. in diameter and 3 ins. thick, furnished with a lug for lifting and a 3-in. tapped hole closed by a screw-plug, through which any soundings or samples of ground could be taken prior to sinking the piles. This plug cover was held in place by a heavy steel "Yoke" under it, which engaged on the under side of the flange, on top of which the cover was set. The yoke was attached to the cover by a 1¾-in. tap-bolt, screwed into the yoke and passing through a 2-in. hole bored in the center of the cover. This rather peculiar mode of attaching the cover was adopted so that the cover could be removed by taking off the nut of the yoke, in case it was desired to open the end of the pile during the process of sinking.

The plug was a fairly close fit at the bottom of the orifice, that is, at the outside circumference of the tunnel, where the bore was 2 ft. 7 ins. in diameter and the plug 2 ft. 6¾ ins. but at the top of the bore-segment there was more clearance, as the plug was cylindrical while the bore tapered outward. To fill this space, it was intended that steel wedges should be used while the shield was being driven, so that they would withstand the crushing action of the thrusting shield, and, when the shield was far enough ahead, that they should be removed and replaced by hardwood wedges. This method was only used in the early weeks of the work; the modification of not using the shield-jacks which thrust against the bore segments was then introduced, and the wooden wedges were put in, when the bore plugs were set in place, and driven down to the stage of splitting.

When it was resolved not to sink the screw-piles, the bores had to be closed before putting in the concrete lining. This was done by means of the covers shown in Fig. 4. The bore plug and all its attachments were removed and the flat steel cover, 2 ins. thick and with stiffening webs on the under side, was placed over the circular flanges of the pile bore. The cover was attached to the bore segments by twelve 1½-in. stud-bolts, 6 ins. long, in the bolt holes already mentioned as provided on these flanges.

When these were in place, with lead grummets under the heads of the bolts and the grooves caulked, the bore segments were water-tight, except in Bore Segment No. 2, at the joint of the distance piece; and, to keep water from entering here, this segment was filled to the level of the top of the flanges with 1:1 Portland cement mortar.

The weights of the various parts of the bore segments are given in Table III.

Sump Segments.—In order to provide sumps to collect the drainage and leakage water in the subaqueous tunnels, special "sump segments" were installed in each tunnel at the lowest point. The details of the design are shown in Fig. 5. The segment was built into the tunnel invert as though it were an ordinary *A* segment. In building the sump, three lining castings were bolted, one on top of the other, and attached to the flat upper surface of the sump segment; meanwhile, the bolts attaching the sump segment to the adjacent tunnel plates were taken out and the plate and lining segments were forced through the soft mud by hydraulic jacks, the three 6-in. holes in the bottom of the sump segment being opened in order to minimize the resistance. The sump when built appeared as shown in Fig. 5, the top conection being made with a special

Plug cover	1	Cast iron	162.0
Dog holders	2	Rolled steel	6.4
Complete weight of one pair, without bolts			7,620.4

casting, as shown. The capacity of each sump is 500 gals. which is about the quantity of water entering the whole length of each subaqueous tunnel in 24 hours.

TABLE IV.—WEIGHTS OF SUMP SEGMENTS.

Past.	No.	Material.	Weight in pounds.
Middle top casting..	1	Cast steel	880
End top castings ..	2	Cast steel	1,718
Lining castings	3	Cast steel	18,232
Sump segment	1	Cast iron	3,560
Total weight per sump, exclusive of bolts			24,390

Turnbuckle Reinforcement for Cast-Iron Segments.—During the period of construction, a certain number of cast-iron segments, mostly in the roof, but in some cases at Manhattan in the invert, behind the river lines, became cracked owing to uneven pressures of the ground. Before the concrete lining was put in, considerable discussion occurred as to the wisest course to pursue with regard to these broken plates. It was finally thought best not to take the plates out, as more harm than good might be done, but to reinforce them with turnbuckles, as shown in Fig. 6. The number of broken segments was distributed as follows:

North Manhattan Tunnel, 87, chiefly in silt (not under the river).

South Manhattan Tunnel, 7, chiefly in silt (not under the river).

North Weehawken Tunnel, 24, chiefly in sand (not under the river).

South Weehawken Tunnel, 48, chiefly in silt, under the Fowler Warehouse.

An order has recently been issued by Chairman Geo. W. Goethals of the Isthmian Canal Commission specifying the amount of lubricants of the various kinds which will be allowed for the use of dredges. The allowances given in the following list are monthly allowances and are based on the maximum requirements of the largest vessels in the classes shown when operated continuously. A corresponding reduction in the consumption of lubricants will be expected on the smaller vessels of a class and when vessels are not at work the entire month:

	Per month. Gals.	Lbs.
Sea-Going Suction Dredges—		
Marine engine oil	375	...
Locomotive engine oil	20	...
Stationary engine oil	100	...
Valve oil	20	...
Kerosene oil	100	...
Lard oil	5	...
Yellow lubricating grease	...	100
Gear grease	...	200
Graphite	...	5
Waste, cotton	...	350
Ladder and Dipper Dredges—		
Marine engine oil	60	...
Locomotive engine oil	25	...
Stationary engine oil	25	...
Valve oil for ladder dredges	5	...
Valve oil for dipper dredges	20	...
Kerosene oil	75	...
Lard oil	5	...
Yellow lubricating grease	...	50
Gear grease	...	125
Waste, cotton	...	100
Graphite—5 lbs. every three months.		
Suction Pipe Line Dredges—		
Locomotive engine oil	50	...
Stationary engine oil	50	...
Valve oil	20	...
Kerosene oil	75	...
Lard oil	2.5	...
Yellow lubricating grease	...	50
Gear grease	...	50
Graphite	...	5
Waste, cotton	...	100

Cost of Testing.—In constructing the Hudson River Tunnels of the Pennsylvania R. R. a cement-testing laboratory was established at the Manhattan Shaft offices, under the charge of a cement inspector who was furnished with assistants for sampling, shipping and testing cement. All materials used on the work, such as bricks, sand, stone, waterproofing, etc., were tested here, with the exception of metals, which were under the charge of a metal inspector reporting directly to the head office. This department cost about $10,000 for salaries and $3,000 for apparatus and supplies, or about $13,000 in all. There were 800,000 bbl. of cement tested, and samples from 2,100,000 brick.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Groove Wooden Block Pavement for a 6 Per Cent Street Grade.

A portion of James street, at Hamilton, Ont., was paved last year with creosoted wooden blocks. On account of the grade these blocks were grooved. The grade is 6 per cent and is at the head of the main street in the city just before it reaches the high bluff and incline railway shown in the accompanying cut. There is a large amount of traffic over this street from two different roads besides the incline railway.

The blocks are laid at right angles to the center line of the street, each block having a groove ½ in. wide and 1 in. deep, the groove being laid at right angles to the center line of the street. The wooden blocks were laid on the flat grade approaching with cement grout,

View Showing Incline on James St., Hamilton, Ont., Having Groove Wood Block Paving.

but on the grade asphalt filler was adopted. The crown was laid very flat, rising only about 2 in. in the center. After the first few weeks, when the surplus asphalt filler had been worn off, there were no complaints whatever about the slipperyness of this pavement, and heavily loaded teams go up and down without any difficulty as the grooves give the caulks of the horses shoes a firm foot hold. The previous pavement has an ordinary macadam, but on account of the amount of water coming down the street from freshets or heavy rainfalls it was unsatisfactory. Mr. Andrew F. Macallum, City Engineer, to whom we are indebted for this importation, states that since the wooden blocks have been laid they have had no trouble whatever in any way.

Comparative Cost of Macadam and Stone Block Pavements at Belfast, Ireland.

The selection of the proper kinds of pavement for a roadway involves the consideration of the relative values in use of the different kinds of pavements available and their adaptability to the varying conditions to which the street to be paved is subjected. This question was quite fully discussed in our issue of Jan. 12, 1910. In a paper read at the Irish Road Congress, held at Dublin, Ireland, April 20 to 22, 1910, Mr. James Munce, Assistant City Surveyor of Belfast, Ireland, also considers this question and gives comparative figures as applied to Belfast on macadam and stone block pavement. The matter that follows this has been taken from Mr. Munce's paper, the costs being figured out on the basis of American Monetary units.

For many years the cost of repairing macadam roads in Belfast was a steadily increasing item in the expenditure of the composition and was becoming so serious that some means of reducing it became imperative. Over four miles are added annually to the mileage kept in repair by the corporation. So the construction of new streets had to be considered as well as the alteration of old ones in order to reduce the cost of maintenance.

When the macadam roads in Belfast were costing about $89,900 to repair, had they been paved $22,000 would have sufficed. In 1883 the average quantity of broken stone used was 955 tons per mile per annum, on about 40 miles. Gradually some of the streets of heaviest traffic were paved, and in 1898 the average had fallen to 500 tons per mile on a length of over 65 miles. The extension of the city in 1898 at once increased the length of macadam roads to 111 miles, but many of the roads added were ordinary country roads of light traffic.

It was not suggested, however, that every street should be paved, but only those costing over 12 cts. per square yard per annum for repairs.

It was found that the scavenging of the macadam roads cost about two-thirds of the sum spent on repairs, so 12 cts for repairs meant a cost of 8 cts. for scavenging, or a total of 20 cts. per yard.

Mr. Munce states that a very liberal estimate of the first cost of a 4x4x6-in. set paving on a 9-in. concrete foundation is $4.08 per sq. yd. including all contingencies. The average cost per year of this pavement would be as follows:

	Cents.
Interest on first cost $4.08 per sq. yd. at 3 per cent	12.20
Sinking fund on portion to be renewed in 40 years at 3 per cent	2.38
Maintenance	.50
Scavenging, including watering	4.80
Total	19.88

The inference for Belfast is that where a macadamized street costs 20 cts. per yard per annum, it is cheaper to pave it.

The older pavements in Belfast are of sets 7 in. deep, 3½ in. to 4 in. wide, and 7 to 9 in. long; but the use of this size ceased many years ago, and 4x4x6 in. deep is the size chiefly adopted now.

A few streets are paved with 4-in. cubes, but it was found that they did not stand the heavy traffic so well as the deeper stones. All the set pavements are laid on a bed of Portland cement concrete, 6 in. to 9 in., or in some cases 12 in. deep, according to the subsoil, and the nature of traffic expected. The sets are laid in 1 in. thick of compo, mixed dry in the proportion of 5 parts of sand to 1 of cement, and spread over the concrete as required by the paviors.

The sets are paved as close as possible, the roughness of the sides giving quite sufficient space for jointing. The pavement is slightly rammed and any loose stones replaced by others. The whole is then flooded with grout, mixed 3½ of sand to 1 of cement, well brushed into the joints—the water gets to the compo bed from the grout. The whole is then well rammed and covered off with sea gravel. Traffic is not permitted over it for a week.

Pavements executed in this way are in good order today without repairs after 20 years' traffic, and in some cases nearly double this time.

Mr. Munce gives the following actual examples of saving or replacing a macadam by stone block pavement:

Macadam, 1,698 Sq. Yds.	Per year.
Actual cost of repairs at approx. 24 cts. per sq. yd.	$ 412.55
Actual cost of scavenging, at approx. 18 cts. per sq. yd.	309.42
Interest on first cost of 60 cts. per sq. yd. at 3 per cent.	30.92
Total actual annual cost	$ 752.90
Total cost for 25 years	$18,822.50
Paved with 4 in. x 4 in. x 6 in. sets on 9 in. concrete	
1,698 sq. yds. at approx. $4	$ 6,792.00
	Per year.
Interest on first cost at 3 per cent.	$ 206.28
Sinking fund at 2¾ per cent.	188.50
Repairs 1 ct. per sq. yd.	16.98
Scavenging at approx. 6 cts. per sq. yd	103.14
Total annual charge	$ 514.90
Total cost in 25 years	$12,869.00
Deduct value of blocks at end of 25 years, 1,698 sq. yds. at approx. $2.16	$ 3,713.52
Net cost of block paving in 25 years.	$ 9,156.48
Macadam	$18,822.50
Paving	$ 9,156.48
Saving to taxpayers in 25 years through paving	$ 9,666.02

Mr. Munce also gives the following data as showing the actual cost of paving with 4 in. x 4 in. x 6 in. sets on 6-in. concrete:

	Per sq. yd.
Excavation, including cartage, 10-27 cu. yd. at 7 cts.	$0.200
Concrete, 1-6 cu. yd. at $3.60	.600
Sets, .27 ton at $4.80	1.300
Paver, 1-3 hr. at 17 cts. per hour	.056
Laborer, 1-3 hr. at 9 cts.	.030
Rammer, 1-6 hr. at 10 cts.	.016
Labor grouting in concrete bed, 1-3 hr. at 9 cts.	.030
Water	.010
Watching, etc.	.040
Use of tools and plant at 10 per cent.	.240
Cement, 26 lbs. at $7.20 per long ton	.090
Sand, 140 lbs. at 80 cts. per long ton	.050
Foreman, 1 to squad of 6 pavers	.016
Total	$2.67
Contingencies	.240
Total per sq. yd.	$2.918

The above is the actual cost without profit on allowance for re-setting curves, gullies, altering bends of same and such like works which depend on the street.

For 9 ins. concrete and 2-27 cu. yds. gravel cementing in cost to 4 cts. and 1/12 cu. yd. concrete amounting to 30 cts.

Mr. Munce gives the following figures as showing the annual charges on two types of stone block pavement:

4 in. x 4 in. x 6 in. paving on 6-in. concrete for private streets; 25 year term:

First cost, 1,000 sq. yds. at $2.92	$2,920
	Per year.
Interest at 3 per cent.	$ 88.68
Sinking fund at 2.74 per cent.	80.96
Repairs at approx. 1 ct. per sq. yd.	10.00
Scavenging at 4 cts. per sq. yd.	40.00
Total	$219.64

Or about 21.9 cts. per sq. ft. per year.

Random sets on 6-in. concrete, for 25-year term:

First cost, 1,000 sq. yds. at $2.40	$2,400
	Per year.
Interest at 3 per cent.	$ 72.90
Sinking fund at 2.74 per cent.	66.64
Repairs at 2 cts. per sq. yd.	20.00
Scavenging at 4 cts. per sq. yd.	40.00
Total	$199.54

Or about 19.9 cts. per sq. yd. per year.

The area covered by one ton of sets paved tightly is given by Mr. Munce as follows:

3½ in. to 4 in. wide, 7 in. to 9 in. long, 7 in. deep—3 yds.

3½ in. to 4 in. wide, 7 in. to 9 in. long, 6 in. deep—3⅔ yds.

3 in. to 3¼ in. wide, 7 in. to 9 in. long, 5 in. deep—4½ yds.

4 in. to 4¼ in. wide, 7 in. to 9 in. long, 6 in. deep—3⅔ yds.

4 in. to 4¼ in. wide, 7 in. to 9 in. long, 5 in. deep—4½ yds.

He states that these areas are very nearly correct, but as stones from different quarries vary up to 5 per cent or more, discretion must be exercised in using them.

Mr. Munce also states that to lay 1,000 sq. yds. of set paving will require the material and labor as follows:

Sets, 275 tons. This will vary with the specific gravity of stone.
333 hours of paver.
333 hours of laborer attending.
[illegible] hours of rammer.
333 hours of laborer preparing compo and grouting.
One week of foreman.
62½ tons gravel, 12½ tons cement, for compo bed and grouting.
Concrete or pitching for foundation, whatever is decided upon.

The Patching of Macadamized Roads and a Special Type of Roller for Doing the Work.*

The author has pleasure in submitting to the Conference a few remarks on the system he has adopted for the repair of macadamized roads. He has long been of opinion that the systematic repair of roads by patching does not receive the attention its importance demands, and simple as the operation is, and notwithstanding its economy, it is not generally carried out in a scientific manner. It will probably not be denied that the patching of a road is desirable, although there may be a difference of opinion as to the extent to which the practice should be carried out. Some authorities appear to be satisfied with repairing holes, which become a source of danger, while others attempt patching by filling up the inequalities with loose material, leaving the traffic to either consolidate it or to scatter it about, according to the state of the weather and the condition of the roads. The author's contention is that the patching of a road should commence immediately it begins to show any appreciable signs of wear, and that it should be regularly and systematically continued up to about the time when it becomes necessary to remacadamize the surface. The result of such a practice is, undoubtedly, not only to maintain a better surface, but to lengthen the periods for re-coating, and consequently, to reduce the cost of maintenance.

The author's experience is that systematic patching generally adds something like 20 per cent additional life to a road. For instance, a road on which patching is not properly carried out, and which usually requires recoating once in five years, will, under the same conditions of traffic, and with systematic patching, last at least six years.

The author believes that the main reason why the patching of roads is neglected is, that it is generally found impracticable with the plant available. It was certainly so in his case. He had charge of about 60 miles of macadamized town roads, for which two ordinary 10-ton steam rollers were provided. These rollers were usually employed on re-surfacing, and occasionally upon patching. But proper patching was found to be impracticable, especially during the summer months. Frequently, when it was most needed, the rollers were urgently required for other work; and when they could be spared they were found too unwieldly to properly carry out the repairs. Moreover, it was necessary that a roller should be accompanied by a water van and a horse and cart, and this was costly and inconvenient.

The author came to the conclusion that what was required was a special roller to be used almost entirely for patching purposes. Such a roller it was thought should be as capable of rolling in a patch and leaving it quite uniform with the adjoining surface. It should be small and compact in order to be as little conspicuous in the streets as possible. It should be capable of being quickly and easily reversed, in order that small patches could be consolidated quickly. It should be heavy enough to carry out any work which could be generally done by a 10-ton roller, and at the same time should be capable of being lightened for working on roads, where a heavy roller would be a disadvantage. It should carry at least 200 gallons of water in order to avoid the necessity of a water cart. It should be powerful enough to draw a load of road metal, thus saving team labor, and it should be capable of travelling about six miles an hour, and should be mounted on springs so as to be as noiseless as possible.

All these conditions are embodied in the roller which the author now uses for patching purposes. It is about 12 ft. long and 5 ft. 6 ins. wide over all. The rolling wheel is 3 ft. wide, and can be weighted from about 5 tons to 9 tons, according to the work it is required to do. The driver and two men are employed with the roller, and they are kept almost exclusively engaged on patching. They leave the depot each morning with about three tons of road metal and binding material, and when this is exhausted the roller travels back for a further quantity. It is surprising to find how small a quantity of stone is required to maintain an even surface to a road if the repairs are not neglected. The best time for patching is after a fall of rain, but if the work is to be successful it must be carried out continuously, except of course in frosty weather. When a road about to be patched is in a dry condition, water is sprayed on to the surface from the tank carried by the roller, and the smallest of holes are then detected. Each hole is picked over in order to loosen the old crust. The patching and binding material are then applied, and the patch watered from the roller tank, and well rolled until thoroughly consolidated. The system has proved most economical and is satisfactory from every point of view.

*Paper by J. S. Pickering, Borough Engineer, Cheltenham, read before the Irish Road Congress, held at Dublin, Ireland, April 20-22, 1910.

Concrete Pavement Construction at Mason City, Ia.

During last summer some 6,000 sq. yds. of Portland cement concrete pavement was laid at Mason City, Ia., under specifications prepared by Mr. F. P. Wilson, City Engineer, at a cost to the property owners of $1.26 per sq. yd. This pavement was laid in a number of wide alleys where traffic is very heavy. The pavement stood the severe winter in good shape and is now in first class condition. As a result contracts were let this year for 45,000 sq. yds. of the same kind of pavement, the contract price in this case being $1.25 per sq. yd., this price including 7 ins. of excavation. Plans are also under way in the city engineer's office for about two miles of this pavement to be laid next spring. The prices for material and labor for the 45,000 sq. yds. now under construction are as follows:

Crushed rock delivered on the street ..... $1.35 per cu. yd.
Sand delivered on the street ..... 0.85 per cu. yd.
Cement on the work ..... 1.20 per bbl.
Labor ..... $2.50 per day

The pavement includes a 1:2:5 Portland cement concrete foundation, 5 in. thick after compacting. The specifications require that the concrete for the foundation shall have such a consistency that when rammed the mass will not shake like jelly, but will when struck, compact within the area of the face of the hammer without displacing the material latterly. The concrete is required to be placed immediately in the work and is spread and thoroughly compacted by ramming until free mortar appears on the surface, which is made smooth and parallel to the surface of the finished pavement. No re-tempering of the concrete is permitted and concrete in which the mortar has begun to set is rejected. It is required that extreme care be taken that the sub-grade is kept moist while this concrete is being put in place, and it is further specified that no concrete shall be laid when the temperature at any time during the day or night falls below 35° F. above zero.

The wearing surface is 2 ins. thick, made of 1 part Portland cement and 2 parts of coarse, clean, sharp sand. Before the mortar has begun to set it is finished off to a smooth surface and corrugated. The corrugations in the wearing surface are made at an angle of 90 degrees unto the crub and are 4½ ins. by 9 ins. by ⅜ in. deep. It is required that the corrugations shall present a slightly rounded upper edge and that no sharp corners be left.

An expansion joint 1 in. in width is left next to the curb on each side of the street or alley, also an expansion joint ½ in. in width left every 25 ft. across the pavement at right angles to the curbs. The expansion joints are filled with an asphalt paving filler applied while heated to a temperature of about 400° F. This filler is applied so that the expansion joints are thoroughly filled clear to the top of the surface of the pavement. Care is also taken to make the expansion joints of practically the same width throughout this depth. After the pavement has been completed it is kept sprinkled for one week, or longer, if deemed necessary.

A Comparison of the Specifications for Creosoted Wood Paving Blocks of Fourteen American Cities.

A study of the various specifications for creosoted wood paving blocks now in force in a number of cities of the United States has been made by Mr. C. Marshall Taylor, Chemist of the International Creosoting & Construction Co., of Galveston, Tex. In connection with this investigation a table was prepared giving in a tabulated form the various sub-divisions of each item covered by the specifications of various cities. This table and a brief discussion of the specifications have been published in the form of a paper, and from this paper we have taken the matter that follows:

In studying the specifications Mr. Taylor found that some of the cities were very minute in their details, while others had omitted much that seems essential in a paving specification. It was found that the size of the blocks vary from 3½ to 4 ins. in depth; 3 in. to 4 in. in width and 5 in. to 10 in. in length.

Almost in every instance second growth timber is not allowed. The wood is usually specified to be at least 90 per cent heartwood, but in one case 25 per cent sapwood is allowed. In most cases Southern long leaf yellow pine is the wood usually specified, though Southern black gum, Norway pine and tamarack are allowed in certain instances. When a variety of woods is allowed the specification is made that all the blocks should be of one variety of wood.

Mr. Taylor found that in the specifications the actual treatment of the blocks is not very clearly indicated in most cases, excepting that the seasoning process should not be excessive and should in no way injure the fiber. The quantity of preservative required varies from 16 lbs. to 22 lbs., the average being 20 lbs. Mr. Taylor found that the most of the stress in all the specifications examined indicates that more particular attention has been paid to the quality of the oil. Most of the specifications require this to have a specific gravity of 1.12 at 60° F.; one is lower, being 1.10 at 25° C. The distillation of the oil, states Mr. Taylor, follows the old retort method and consequently is allowable for many variations due to the difference in actual distillation. The specifications usually allow not over 40 per cent to distill over below 315° C.

Nearly all of the specifications call for pure coal tar creosote, and yet require a gravity of approximately 1.12 at 68° F. and also that not more than 35 per cent shall distill over below 315° C. Discussing this part of the specifications, Mr. Taylor states: "Allowing a variation which would exist in distilling an oil by the old retort method and that used by the U. S. Forest Service, it seems impossible to fulfill both the specifications of having a pure coal tar creosote and also of getting the required gravities and distillations as given in the specifications," according to the Forest Service the lowest percentage of distillations of pure creosote oils at 315° is 42 per cent. This discrepancy, states Mr. Taylor, as to the

TABLE SHOWING THE REQUIREMENTS OF VARIOUS CITIES FOR CREOSOTED WOOD PAVING BLOCKS.

CITY	Size of Block	Method of Seasoning.	Lbs. of Oil	Gravity	Distillation Regulations.	Statements Concerning the Oils.	Position of Thermometer in Paving Pitch.	Further Statements Concerning the Oil.	Absorption Test.
Boston	3"x8"	Southern L. L. Pine	20	1.12@68 Fahr.	Not more than 35% over at 315 C. Not more than 50% at 350 C.	Antiseptic Water Proofing	1" above Oil	"Oil is to be free from adulteration, it is not to be mixed with or contain any foreign material."	Not to increase over 3% in weight
Minneapolis	4"x8"x6" 4"x8"x5" 4"x8"x4" 4" deep 3" width 6" to 10" long	Heat and Vacuum.	16	1.12@20 C.	315	Pure, Heavy Creosote Oil from Coal Tar only	1½" above Oil	Shall not contain more than 3% of matter insoluble in "Benzine."	
Philadelphia	3" deep 3" to 4" width 6" to 10" long 3" deep 3" to 4" width 6" to 10" long	Heat and Vacuum.	20	Not given	Not mentioned.	Antiseptic and Water Proof Mixture			Gain not over 3½%
Toledo	3½" deep 3" to 4" width Long, width Vary	Dry Heat or Superheated Steam in Closed Coils.	16	1.10@68° F.	Up to 600° F. shall not lose more than 35%	Antiseptic and Water Proof Mixture	1" above Oil	Absolutely soluble in benzine Pure, Coal Creosote	Gain not over 4%
St. Louis	3½" deep 3" to 4" wide 6" to 10" long	Southern Long Leaf Yellow Pine.	20	1.10@38° C.		Best Grade of Coal Tar Creosote	½" above Oil	Not over 5% Free Carbon	
New York	3½" deep 3" to 4" wide 6" to 10" long	Sou. L. Leaf Yellow Pine, Sou. Black Gum, Norway Pine, Tamarac	20	1.12@68 F.	Not over 35% up to 315 C. Not over 50% up to 350 C.	Antiseptic and Water Proof Mixture	1" above Oil	"The oil is to be free from adulteration."	Gain not over 3½%
Pittsburg	3½" deep 3" to 4" wide 6" to 10" long	Same as New York.	20	1.12@68 F.	Same as New York	Antiseptic and Water Proof Mixture	1" above Oil	"The oil is to be free from adulteration."	Gain not over 3½%
Mobile	3" deep 3" Wide 6" to 8" long	Superheated Steam or Dry Heat.	20	1.12@68° F.	Not over 10% up to 600° F.	Heavy Creosote Product		Absolutely soluble in Benzol	Gain not over 3%
Indianapolis	3"x3"x3"	Superheated Steam and Vacuum.	20	1.12@68 F.	Not over 35% up to 600° F.	Heavy Creosote Product		Above the Oil Absolutely soluble in Benzol	
Des Moines	3½"x11"x6" 3"	Heat and Vacuum.	20	1.12@20 C.		Pure and Heavy Creosoting Oil	½" above Oil	Not more than 3% insoluble in absolute alcohol or "benzine."	
Chicago	Not less than 7 ins. per inch	Sou. L. Leaf Yellow Pine, Tamarac, Southern Black Gum	20	1.10@25° C.		Pure Coal Tar Product free from any adulteration		Not more than 3% insoluble in benzine	
Baltimore	3"x9"x8"	Long Leaf Yellow Pine or Black Gum	20-22	Not given.	Not more than 5% tar or 5% carbolic acid	Antiseptic and Water Proof Mixture		Shall not contain more than 5% tar or 5% carbolic acid	Gain not over 3%
Cincinnati	3½"x3"x6"-8"	Southern Long Leaf Yellow Pine	Dry Heat of Superheated Steam in Closed Coils and Vacuum	20	1.10@68 F.	Not more than 35% up to 315° C.		1" above Oil	The oil must be free from adulteration
Detroit	4"x8"-8"	Long Leaf Yellow Pine							

impossibility of the oil meeting the requirements for distillation also exists for that of gravity. Taking the portion of a creosote oil which comes off at 300° C. Mr. Taylor states that it is evident from figures of the U. S. Forest Service that the greatest majority of the oil of a pure coal tar creosote has a gravity less that of even 1.09, the average being about 1.045. These gravities were taken at 60° C. Reducing the 1.09 gravity down to 15° C. it would have a gravity of 1.126 and that of 1.045 would have a gravity of 1.081.

The accompanying tabulation shows the different specifications of the various cities. In reproducing this table from Mr. Taylor's paper we have left out several subdivisions and have embodied them in the text as follows:

Second growth timber: Not allowed in all the cities except Mobile, where it is specified that the blocks if of record growth must be from live trees. Baltimore did not mention this item in its specifications.

Heartwood: Boston, Minneapolis, Philadelphia, Toledo, New York, Pittsburg, Mobile, Baltimore and Cincinnati specify 90 per cent; St. Louis specifies 75 per cent; Minneapolis does not mention the matter.

Physical properties of the oil: Boston—Liquid at 25° C. No deposit at 22° C. Des Moines—Entirely liquid at 25° C. No deposit at 22 °C. These were the only notes under this subdivision.

Per cent water allowed: Two references in the table: Minneapolis, 2 per cent; St. Louis, 3 per cent.

Remarks: Minneapolis—Correction is made for emergent stem of thermometer; Des Moines—Gravity of residue above 600° F. to be over 1.15.

Cost of Earth Road Maintenance With the King Road Drag.—The following data on the maintenance of earth roads by the use of the King road drag was given in the report of the Committee on Roads and Pavements of the Iowa Engineering Society. The committee gave the information in the form of a report from Mr. P. Ransom, of Owasa, Iowa, who, it is stated, has perhaps as efficient a township organization for dragging roads as any man in the state of Iowa. His report verbatim is as follows: "I have had charge of the road work in this township for six years and in the spring of 1906 I organized the farmers to drag roads on stations whereby I could call them up by 'phone and start each one out with the drag at the same time all over the township. We have steadily followed this plan up to the present time, dragging our roads after every bad storm, with the gratifying results of having nice smooth roads at an average cost per year as follows: In 1906-7-8, about $4 per mile. In 1909 it was $6. The cost varies of course according to seasons. By dragging our roads regularly we keep them well crowned, which turns the water off into the side ditches on the hills and grades alike, while under the old system of grading our roads a little once a year without maintenance, the water washed deep ruts in the wheel tracks down the hills, and the grades became flat and gullied out so they would hold water instead of shedding it. I believe the road drag not only to be a very economical maintainer of dirt roads, but a great money saver in the long run if proper planning and preparation by grading goes in advance of it. For example, in the spring of 1906 we built numerous new grades which have been maintained with the road drag only since then, and are in fine condition and well crowned; we have built new grades every year since and the drag is taking care of them. Our intention is to continue this plan till every rod of road in the township is graded to completion, and I firmly believe with but few exceptions, road dragging will be the only maintenance necessary thereafter. By past experience of four years, I estimate the cost of maintaining our roads with the drag after they are all graded, to be $5.00 per mile for each year. Our tax levy for road funds being about $20 per mile, it can be readily seen that we would enjoy a saving of $15 per mile over the old system, except in the matter of culverts and drainage."

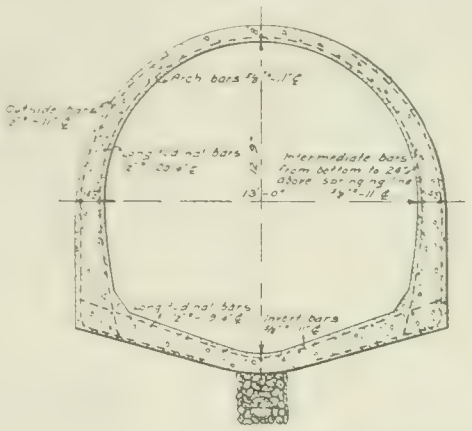
Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Details of the Design of the Sewers of Louisville, Ky.

In ENGINEERING-CONTRACTING, June 8, 1910, was published a general outline of the scheme and purposes of the new system of sewers now under construction in Louisville. In this article are shown some of the details of the design, which are in some cases original with this new system, and which in all cases are interesting to study, inasmuch as modern design of sewers is here illustrated in a great many branches.

Sewers.—In the design of all combined sewers and storm-water drains, the quantity of storm water which will reach the sewer has been estimated by the McMath formula. This



13'-0" SECTION.

Fig. 1—Horseshoe Type of Concrete Sewer.

formula as originally constructed was based upon the observed flows of storm water in the sewers of St. Louis, and is used as being the formula apparently best adapted to the conditions in Louisville. It takes into account the maximum rate of rainfall to be provided for (which has been assumed to be 2.25 ins. per hour), the average slope of the territory drained, and the proportion of rainfall reaching the sewers as influenced by the amount of pavement and impervious territory within the tributary basin. The average slope was assumed in most cases to be 4 ft. per thousand. In the eastern portion of the city where there are steep slopes, this factor was materially increased. The factor depending upon the impervious area varied from 0.4 to 0.75. In addition to storm water an allowance was made for .016 cu. ft. per second for sewage and ground water.

For the determination of the sizes of sewers, Kutter's Formula was used, and a coefficient of 0.013 was adopted as being conservative for the smooth concrete channels. The required size of a sewer depends somewhat upon the smoothness of the interior surface and because of the smooth finish possible by the use of concrete this material is particularly favorable for this class of structures. A further argument in favor of the use of concrete is the fact that it is much less expensive than brick or stone masonry. It is also possible because of the building of monolithic structures, to vary the thickness of walls in a way which cannot be done with brick or stone masonry because of the fixed dimensions of the blocks, and thus reduce slightly the thickness where not required and increase it where needed. In this way an additional reduction in expense is effected by reducing the quantity of masonry required per lineal foot of sewer.

The only serious danger in the use of concrete is that it may be affected by acid in the sewage. Fresh sewage is normally alkaline and practically the only source of acid is the waste liquors from manufacturing establishments. A careful examination was made of the sewage in various sewers about the city and of wastes from many manufacturing establishments. As a result of these investigations it was decided that it was perfectly safe to use concrete in the construction of the sewer system and its use was, therefore, adopted.

In certain places where the velocity of flow in the sewers will be great, the bottom or invert of the concrete sewers has been lined with vitrified brick masonry, at additional expense, on account of its superior wearing qualities and the size has been increased to correspond with the increased roughness of the interior surface.

The concrete has been composed almost wholly of sand and gravel dredged from the Ohio River, although in some localities it has been possible to use sand from the trenches. The contract specifications do not permit the use of broken limestone as a constituent part of the concrete. The reason for excluding the use of limestone, which is very common and comparatively inexpensive in this locality, is that it cannot withstand erosive action as well as the river gravel. Comparative tests of concrete containing river gravel and broken limestone were made very early in the studies upon the sewer system, and it was found that while the concrete composed in part of river gravel would wear as well as, and in many cases better than ordinary sewer brick, the concrete made of broken limestone would not withstand the abrasive tests nearly as well. Some gravel has been obtained from the sewer trenches which was of proper size for use in the concrete, but in some cases the pebbles were so soft and friable that they could be broken between the fingers and many were also partially disintegrated. The use of gravel from the trenches was finally discontinued.

The minimum thickness of concrete used upon the sewers and drains is 5 ins. at the crown of the arch and 6 ins. in the center of the invert. In reinforced structures the steel

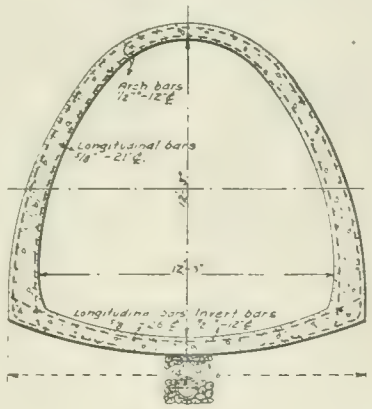


Fig. 2—Semi-Elliptical Section of Concrete Sewer.

reinforcement is required to be at least 1½ ins., but is rarely more than 2 ins. from the surface of the concrete. Plain concrete has been used in sizes up to and including 66 ins. and reinforced concrete in the structures as small as 39 ins. in diameter, the decision as to which material should be used depending upon the foundations, depth of cut, convenience in placing, and other local conditions.

Typical sections of combined sewers of the separate system, and of sewer in tunnel construction are shown by Figs. 1 to 4. The shapes are of the horseshoe and the semi-elliptical types in concrete sewers. The semi-elliptical type is so named because it is a slight variation from the horseshoe type and is narrow at the top of the arch and very broad at the invert. The advantage of this is to allow room for better backfilling, and provide a greater stability against vertical loads than is afforded by the horseshoe type.

Outlet Structures.—In fixing the elevation of

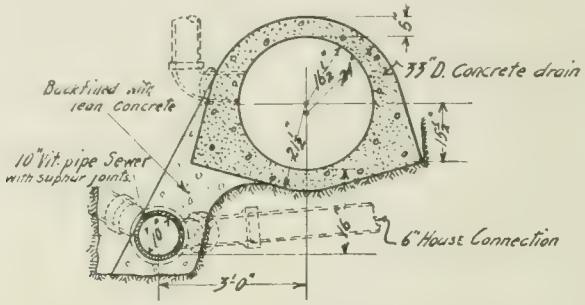

Fig. 3—Typical Section of Separate System.

the outlets in all cases the intention has been to empty the sewage under the surface of the river. The establishment of a 9-ft. depth of water in the Ohio River, as fixed by the Government's movable dams, has made possible the fixing of the outlets and the accomplishment of the above purpose.

The banks of the river at the outlets for both the Southern Outfall and the Northwestern Trunk sewers is high and steep and the designs for the drop chambers and outlet structures are similar.

Figure 5 shows the profile and sections of this structure. At these places there has been a strong tendency of the river bank to move towards the river after the falling of the water in the late spring or summer. The bank is composed largely of silt, which becomes saturated when the river is high, and when wet it is very heavy and has little stability. Underlying the silt is a bed of coarse sand and gravel, through which large quantities of water are continually flowing toward the river. The action of this water at the surface of the gravel probably tends to assist the sliding action of the silt above. In anticipation of any such action and consequent effect upon the sewer at its outlet, the foundaton was carried down to bed rock. For a short distance, 15 ft., the rock was excavated for a depth of 4 or 5 ft. and the foundation carried to this depth, thus forming a key to further guard against any movement.

The drop chamber was built upon piles to assist in resisting any possible movement, as well as to support the structure in case by any chance it should be undermined by the action of the river. These piles extend to the rock, where it was within 20 ft. below the masonry, and 20 ft. into the ground further up the bank, in all cases penetrating a long distance into the gravel underlying the silt.

The outlet structure is 8 ft. in width and 8 ft. high, having a semi-circular arch, vertical side walls, nearly three ft. in height, and a comparatively flat but curved invert. At the end of this structure, two wing-walls were built, projecting out into the river, each making an angle of 45° with the axis of the sewer. The drop chamber is provided with arch, short side walls and invert of the same dimensions as those of the outlet structure. In the center of the invert, however, there is a channel 3 ft. wide and 2 ft. 10 ins. deep, the bottom of which is lined with half-round vitrified sewer pipe. This channel is provided for the dry weather flow, which will have a very high velocity. The vitrified pipe lining was used rather than vitrified brick because of the absence of longitudinal joints at which sewer inverts on steep grades usually show the greatest amount of erosion, and for its great wearing qualities. The beam on each side of this channel will make inspections of the structure practicable. On account of the high velocities which will be obtained during the lower stages of the river, both of these portions have been lined with brick as high as the spring of the arch.

At the Northwestern Trunk Sewer the outlet chamber is founded on caissons carried to solid rock.

The Beargrass Intercepter outlet and the 34th Street Outlet are of somewhat similar design. The latter outlet is merely a new outlet replacing an old one for an existing sewer. The concrete foundations of the outlet chamber are carried into the rock and keyed there to prevent possible movement. Piles are used for the balance of the sewer foundations to a point where solid ground is encountered. Figure 6 shows the 34th Street Outlet. A good idea of the location of the mouth under the water surface is given by the contours in the figure. The section of the outlet was widened and made lower so that no interference with navigation would be possible on account of the existence of the sewer.

Junction Chambers.—A typical junction chamber is shown by Figs. 7, 8 and 9. In all junction chambers, the top or crown of the sewer is carried continuously and the bottom or invert is raised in amount equal to the difference of the vertical diameters of the adjoining sewers. All branch sewers are so designed that their crowns near the junction shall be at the same elevation as the crown of

the main or trunk sewer, but where necessary the branch sewers for a short distance pitch down nearly to the bottom of the trunk sewer, so that the sewage may be admitted without undue disturbance.

Inverted Syphons.—There are two cases in which trunk sewers are carried under Bear-

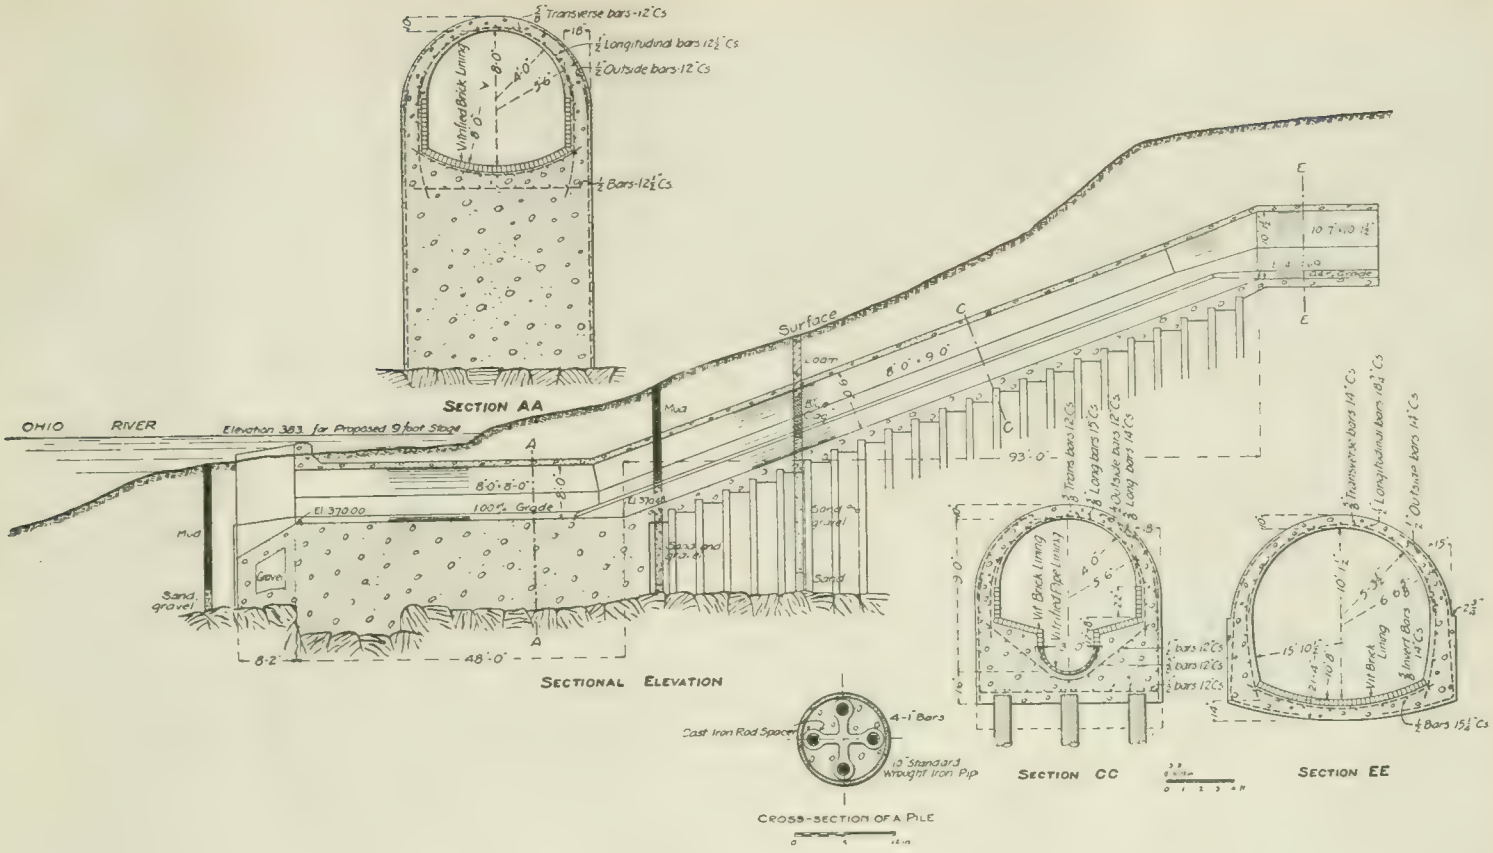

Fig. 5—Details of Outlet Structure—Southern Outfall Sewer.

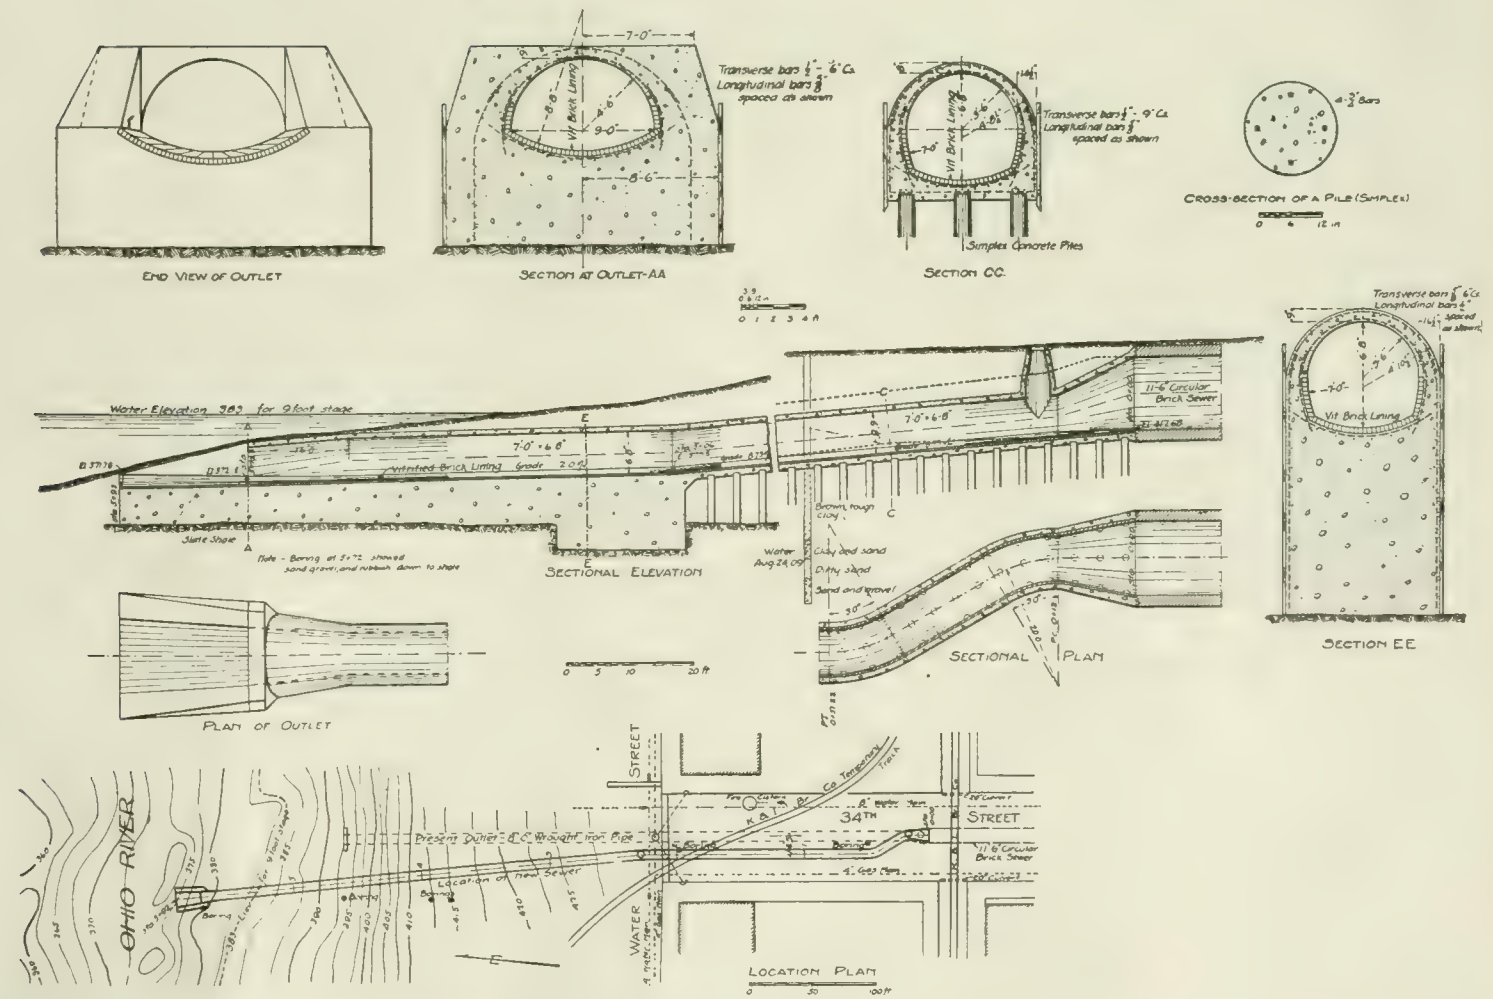

Fig. 5—Details of 34th Street Outlet.

grass Creek by means of inverted syphons. It should be noted that here the design of the syphons has been with the idea of intensifying the flow, or increasing the velocity by using a number of smaller pipes. The areas of all pipes being taken together would provide for

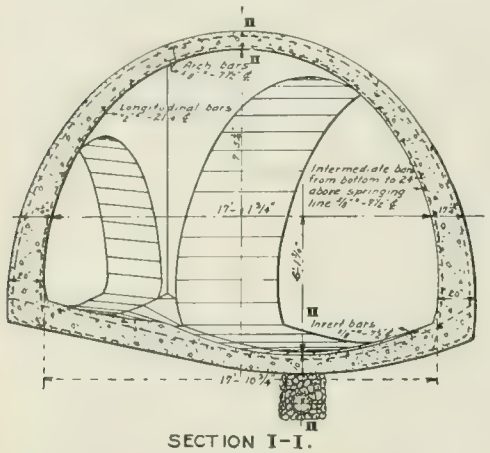

Fig. 7—Transverse Section of Junction Chamber.

the full capacity of the sewer proper; but provision is also made in this way to use only the number of pipes required for different quantities of sewage.

The Northeastern Trunk Sewer is carried under the creek and the levee embankment in the form of a syphon, shown by Fig. 10. The sewer, 48 ins. in diameter, is replaced for a distance of about 800 ft. by the syphon which is composed of three pipes, two or which are 30 ins. and one 18 ins. in diameter. These are vitrified clay pipes incased in a generous amount of concrete. At the eastern or inlet end of the siphon there is a chamber into which the sewage will flow and from which it may enter the siphon pipes. The arrangement is such that any one, two or all of the pipes may be put in service according to the quantity of sewage flowing. It is intended that the entire flow shall be confined to the 18-in. pipe as long as the quantity of sewage does not exceed its capacity. When this quantity is exceeded one of the 30-in. pipes will be substituted for the 18-in. pipe. In this way only such pipes will be in use as are required to carry the quantity of sewage flowing, changes being made from time to time to correspond with the increase in flow due to the growth of the city. The entrance to each pipe is controlled by a sluice gate set in the masonry and also by stop planks and overflow chambers so that in case of emergency the sewage will flow automatically into a second or third pipe when the one in use is overcharged. Provision is also made to allow an automatic overflow into Beargrass Creek. If at any time the siphon is out of order or if it needs repairs or cleaning, the entire flow may, for a short time, be turned into the creek by a special 30-in. conduit. A concrete gate-house is built over this chamber from which the various gates of the siphon may be opened and closed.

At the outlet or western end of the siphon there is a special chamber in which any or all of the pipes may be closed by means of stop planks. Just west of the creek and at the lowest point of the siphon a third chamber is provided for the purpose of draining and cleaning any of the pipes. Each pipe is so arranged that a section 4 ft. long may be removed after the sewage has been emptied into a sump and pumped out into the creek. From this chamber the siphon can be thoroughly cleaned in either direction to the inlet or outlet chambers.

Figure 11 shows the cast iron pipe used to carry the Middle Fork sewer under Beargrass Creek to its junction with the Beargrass Interceptor. This structure consists of two 12-in. pipes carried under the creek with the same invert grade as that of the sewer. In addition to these there is provided a 36-in. iron pipe dipping down from the grade of the sewer beneath the bottom of the creek. This pipe will act as an inverted siphon but will not be put into use until the flow in the sewer exceeds the combined capacity of the two 12-in. pipes. At each end of this semi-siphon there is a concrete chamber giving access to the sewer to facilitate cleaning when found to be necessary. There is also provided an emergency outlet into the creek through which the sewage may be turned when the siphon is being cleaned or repaired. A sluice gate provided in the westerly chamber also makes it possible to shut off any back water from the Beargrass Intercepter at such times. The three pipes are surrounded by concrete, the top of which is coincident with the bottom of the concrete invert channel of the creek when it is improved.

Several small inverted syphons pass under Beargrass Creek, carrying combined sewage and storm water to the Beargrass Intercepter. An arrangement is made, by means of a floating hollow sphere attached to a lever which operates a small gate, to shut off the flow to the Intercepter whenever the capacity of that sewer is being too severely taxed. In such case the sewage, instead of passing through the siphon, overflows through another pipe directly into the creek.

Drain and Sewer Design.—One of the unique designs is that of the Northeastern Trunk Sewer, where it lies along the old bed of Beargrass Creek. This creek has now been diverted into a cutoff channel and although the sewage flows in the same direction as the creek formerly flowed, the storm water drainage is required to flow from the district in the opposite direction. In providing for these conditions the sewer was designed and built as a double decked affair, shown by Fig. 12. This method of construction proved particularly advantageous because the bearing power of the soil in this vicinity is low, and either structure, built separately, would require a pile foundation. By combining the two structures in one, only a single pile foundation was necessary. The sewer is placed over the drain and the two are separated by a chamber which is very low at the upper end but which gradually increases in height, due to the difference in grade and elevation of the two chambers. The elevation of the invert of the sewer is near the surface of the ground nearly the entire distance.

Manholes.—Figure 12 shows a typical manhole for the sewer and drain described above, including the entire section of the structure. This manhole serves as an entrance to the drain only, and Fig. 13 shows the type used for entrance to the sewer. In this manhole it is necessary to provide a tight cover, as shown, to prevent the floods of the Ohio River from submerging the land behind the levee by passing through the sewers and overflowing at the manholes. The immediate district wherein these tight manholes are used is so low that no connections to the sewer have been provided for, and so there is no other outlet at which the floods in the river might overflow.

The double manholes shown by Fig. 14 are used in connection with the separate system of the Northeastern section.

Sulphur Joints.—A large part of the separate system is built of vitrified pipe. The drain pipe have joints of Portland cement, while the sewers are made with sand and sulphur joints in order to prevent, as far as possible, the admission of ground water, and this reserve as far as possible the full capacity of the

sewers for house sewage. In the beginning of the work a mixture of sulphur and sand in equal parts was tried, a very fine molding sand from a local pit being used. From the first this mixture gave trouble, several radial cracks appearing on each joint as soon as the joint was poured, indicating excessive shrinkage of the mixture. It was also found that about twelve hours after pouring, the entire joint loosened, permitting the easy separation of pipes. All materials and methods used were then subjected to careful examination.

The sand used contained a considerable percentage of clay and was therefore washed, by which process a large portion of the clay was removed. Using the washed sand and the utmost care in making joints gave no better results than before. Finally, sand of about the same grade as that already in use, but with less clay in it, was obtained from the same local pit. To ascertain what sands were best adapted to this work, test joints were poured, as follows: Using (1) Molding sand containing little clay, 10 parts to 10 parts sulphur; (2) Ohio River sand, screened through No. 20 sieve, 10 parts to 10 parts sulphur. (3) Molding sand 6 parts to 4 parts screened Ohio River sand and ten parts sulphur.

The last named mixture gave the best results, there being in it as much Ohio River sand (screened through No. 20 sieve) as could be carried in suspension in the fluid mixture.

Further experiments have been made on other contracts by varying the proportions of sand and sulphur and also the proportion of the two grades of sand. These experiments have confirmed the results of the former tests, i. e., that with local materials the mixture composed of six parts molding sand, 4 parts Ohio River sand screened through No. 20 sieve, and 10 parts sulphur gives best results. With this mixture the loosening of the points has entirely disappeared and radial checks occur only very rarely and do not appeal to allow the ground water to enter the sewer.

In making these joints three or four lengths of pipe were placed in a wooden cradle located on the surface of the ground, carefully fitted together, lined up and calked with jute, the pipe at one end of the cradle being so braced that these pipes could be forced firmly together by wedging, before the joints were made. "Pipe jointers," made of square, braided asbestos, were then so placed around the pipes at each joint and fastened, as to prevent the liquid from running out of the bells. After these jointers were secured in place, the joints were poured.

Some care is required to regulate the temperature of the sulphur-sand mixture because while it begins to melt at a temperature of about 200° F. and becomes thin and suitable for pouring at about 260°, if the temperature is allowed to rise more than 25° to 40° higher, it again becomes thick and plastic, in which condition it cannot be poured. The facts are shown clearly by the following tabulation:

Physical Condition of Sulphur and Sulphur-Sand Mixtures at Different Temperatures.

Condition.	Temperature Fahr. Sulphur.	Sulphur-Sand.
Began to melt	176°	201°
Fluid	212°	261°
Slightly vicid	234°	302°
Would not pour	248°	315°

It is interesting to note to what extent the admixture of sand with sulphur affects the temperatures at which it changes its condition.

After pouring, the mixture hardens very rapidly so that an interval of time of perhaps one minute the asbestos jointers can be removed. While the jointing mixture is still warm it is coated with hot tar pitch as a further safeguard against leakage. Within five minutes after the joints are poured the entire length of three or four pipes, as the case may be, can be removed from the cradle and placed in position in the trenth. Although the joints attain an almost incredible strength in this short interval of time, care must be exercised in moving the pipe so that the joints and bells of the pipe shall not be unnecessarily strained.

The joints between sections of pipe were poured in the trench. When water was encountered in the work, care was taken to hold its level below the pipe joints. Otherwise the liquid mixture skipped the portion of the joint submerged in water.

Fig. 12—Section Showing Sewer and Drain on One Pile Foundation, with Drain Manhole.

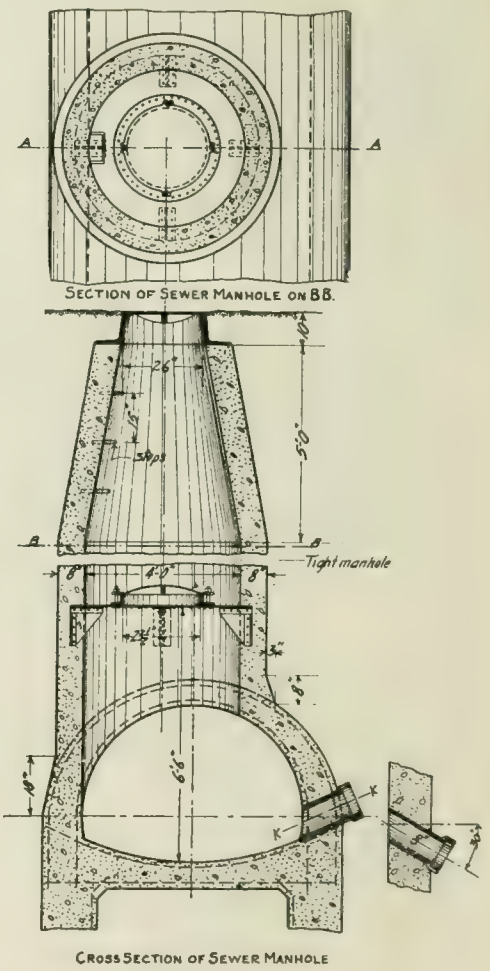

Fig. 13—Sewer Manhole for Sewer as in Fig. 12, Showing Water-tight Cover Inside of Manhole.

This method of jointing pipe aids materially in the inspection of the work, since perhaps three-fourths of the joints are made on the ground surface, where they are readily accessible. The larger proportion of the work of pipe jointing which can be performed on the surface of the ground regardless of conditions in the trench has, in many instances, tended toward better progress and economical work.

Experience has proved that a total length of 8 or 9 ft. of pipe on the cradle was most satisfactory. In other words, when 2 ft. lengths of pipe were used four pieces of pipe, and when in 3-ft. lengths only three pieces could be advantageously jointed at one operation. After a fair trial of make-shift jointers, it was decided that an asbestos jointer, with spring clamp, facilitated the work and gave best results. A substantially built cradle, with the templets holding the pipes accurately placed as to line, was found to be both necessary and economical. Coal heaters, copper kettles and generous sized ladles all tended to better work and progress.

Good briquettes made of sulphur and sand of the proportions used on the work, showed a tensile strength of from 520 to 640 lbs. per sq. in.

About two years' work remains before the completion of the system, as outlined, can be accomplished.

Further articles will take up some features of the construction work, and the proposed improvement of Beargrass Creek. Among those to whom we acknowledge indebtedness for information in preparing this article are Mr. Harrison P. Eddy, Consulting Engineer; Mr. J. B. F. Breed, Chief Engineer; Mr. J. H. Kimball, Designing Engineer, and Messrs. F. C. Williams, H. P. Wires and H. S. Morse, Resident Engineers.

At the annual meeting of the stockholders of the Statesville Air Line R. R., at Statesville, N. C., it was decided to have work started soon on the proposed line from Statesville to Mt. Airy, N. C. The line will be 60 miles long and $357,000 of bonds have been voted towards its construction. D. M. Ausley is interested.

The Northern Pacific Ry. Co. has secured a strip of land 3,500 ft. long and 500 ft. wide, doubling the holding of the company at that point between East Seventh street and a point near Plum and Commercial street, where Dayton's Bluff draws near the Northern Pacific's old property, in St. Paul, Minn. The newly acquired property will be used for freight terminals.

Keeping a complete record of the cost to the contractor of constructing the Hudson River Tunnels of the Pennsylvania R. R. at New York City cost the company $12,000 for salaries for recording clerks.

The Pittsburg Trust Co., of Pittsburg, Pa., through Judge Edward A. Mann, is reported to have filed in the District Court at Santa Fe, N. Mex., a complaint against the New Mexico Central R. R. Co. to foreclose the mortgage given to secure an issue of $2,000,000 in bonds and asking for a receiver to sell the property in its entirety. This road extends from Santa Fe to Torrance, 116 miles, and the action is reported to be preliminary to extensions of the line.

The Nebraska & Dakota Ry. Co., incorporated with a capital stock of $500,000 and headquarters at Pierre, S. Dak., and a business office at Chicago, Ill., proposes a line to run from Murdo, S. Dak., to Burwell, Neb., in the counties of Lyman, Mellette, Todd and Tripp, South Dakota, and Rock Loup and Garfield in Nebraska, a distance of 180 miles. The incorporators include: Albert Martin, B. McWilliams, Paul Miller, J. H. Christensen, Samuel C. Ware, Charles J. Reublings of Chicago, and L. L. Stephens, Pierre, S. D.

Railway Section

Note: This section is devoted to methods and costs of constructing railways. It will cover road-bed and track construction, contractor's plant and organization, surveying methods and permanent way structures.

Gang Organization for Cost of Tracklaying by Machine, Erie R. R.

The following data on tracklaying by machine are given by Mr. C. K. Conrad, Assistant Engineer for the work in the low-grade freight line from Guymard to Highland Mills of the Erie R. R., in the *Railroad Age-Gazette* for June 3, 1910. A Hurley, tracklaying machine was used.

After many trials with fewer men, it was found that the best results were obtained with 50 men, working as follows:

1 General foreman.
1 Foreman.
1 Lineman stretching a light rope at proper offset distance from center line.
2 Tie spacers.
1 Tie marker, placing marks on ties so that center of tie will be set midway between rails.
1 Clamp man, applying hoisting clamp to rails before lowering.
1 Clamp man on ground disengaging hoisting clamp and steadying rail.
8 Spikers, four to each rail.
4 Nippers, two to each rail.
2 Bolters, one to each rail.
1 Assistant working rail conveyor, as rails leave the friction rolls.
1 Bolter, removing bolts as rails leave the roll.
1 Foreman.
1 Watchman (night).
4 Feeding ties to dogs at rear of machine.

7 Total on machine.

2 Breaking out ties.
8 Spacing ties.
1 Watching and guiding ties.

11 Total attending to the ties.

1 At rear hoist.
1 Advancing rails on rollers.
2 Placing angle bars, and one bolt on front end of rail.
2 Bolting to forward rails.
1 Tightening bolts.

1 Total feeding the rail.

1 Clamper, holding angle bars for bolts.
2 Barmen, holding rail to gage.
1 Spike peddler.

25 Total in front of wheels of machine.

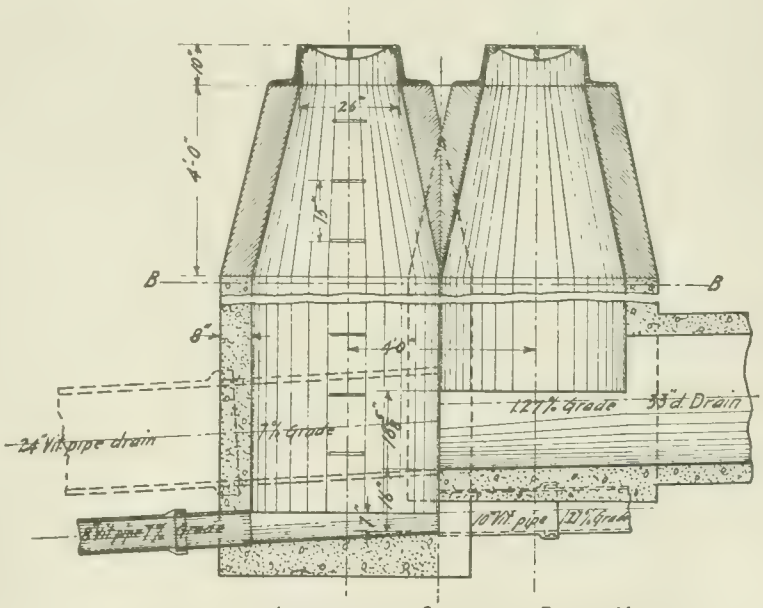
1 Engineer, in charge of the machine.

Cost of Laying Track.—Nearly all of the second track on the Erie & Jersey was laid by hand. As most railway companies are familiar with this cost on their own line, it seems advantageous to compare it with the cost of the first track in order to give a correct idea of what the cost with the machine would be under the same conditions.

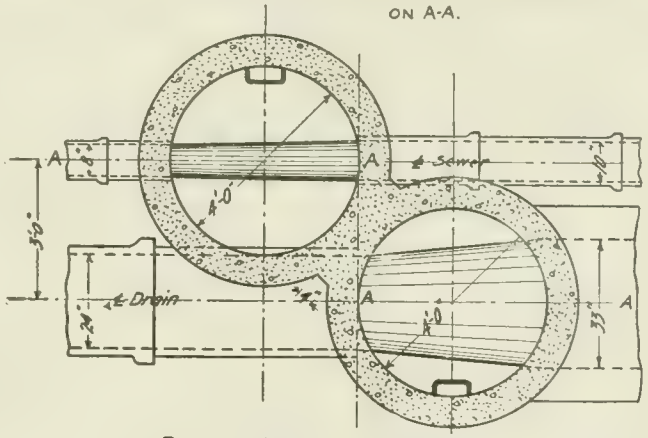
With a machine laying a mile per day the cost was as follows:

Laying Track by Machine.

1 General foreman at $5.00	$ 5.00
1 Engineer at $5.00	5.00



LONGITUDINAL SECTION OF DOUBLE MANHOLE ON A-A.



PLAN OF DOUBLE MANHOLE ON B-B

Fig. 14—Details of Double Manhole on Separate System.

1 Fireman at $2.25		2.25
1 Foreman at $3.50		3.50
50 Laborers at $1.50		75.00
1 Watchman (night), at $2.25		2.25
Machine, coal and oil		3.00
Full bolting and spiking after passage of machine:		
1 General foreman at $5.00	$	5.00
1 Foreman at $3.50		3.50
50 Laborers at $1.50		75.00
Loading materials—ties:		
1 Foreman at $3.00		3.00
35 Laborers at $1.50		52.50
Engine and crew		35.00
Rails and fastenings:		
1 Foreman at $2.00	$ 2.00	
20 Laborers at $1.50	30.00	
Total	$ 32.00	
6,963 lin. ft. of rail and fastenings loaded:		
This gives per mile of track	$ 48.53	
Engine and crew	35.00	
Total rail and fastenings		$ 83.53
Total per mile of track		$380.53
Laying Second Track by Hand.		
Spacing ties, spiking and full bolting 3,000 ft.:		
2 Foremen at $3.00	$ 6.00	
74 Laborers at $1.50	111.00	
Total	$117.00	
Per mile		$205.92
Loading ties:		
1 Foreman at $3.00	$ 3.00	
35 Laborers at $1.50	52.50	
	$55.50	
Unloading ties:		
1 Foreman at $3.00	$ 3.00	
6 Laborers at $1.50	9.00	
	$12.00	
Engine and crew	35.00	
		$102.50
Loading rail and fastenings, same as for machine		$ 48.53
Unloading rail and fastenings:		
2 Foremen at $2.00	$ 4.00	
28 Laborers at $1.50	42.00	
Total	$ 46.00	
Above worked four hours	18.40	18.40
Total per mile of track		$375.53

It should be realized, of course, that these figures do not represent the cost of continuing the work day by day; but they are representative figures for each class of work under similar conditions. The cost of laying the first track of a double track railway by hand is variable, depending largely on the accessibility of the roadbed for teams, as the ties are usually transferred from the tie car to the front by this means. The second track should be laid at a fairly regular cost.

So far as the track laid by machine is concerned, it is not possible at this date to determine which track was so laid. When laying down grade there is a tendency to open the joints. Clips for the proper temperature expansion are a necessity. From the experience with the machine the following may be accepted: (1) On a new line 25 miles long, or more, the machine will prove economical. (2) The track laid with the machine will be as satisfactory as track laid by hand. (3) The organization will be reduced in number by 150 to 200 men. (4) It is feasible to lay one mile of track per day up to a limit of 12 or 15 miles from the supply base. (5) The danger of injury to men is largely reduced.

The Treatment of Depreciation of Street Railway Properties.*

Each street railway corporation in the United States is today in possession of a blank form of the Internal Revenue Bureau, one line of which, under the heading "deductions" from gross income, is as follows:

"5-b. Total amount of depreciation Jan. 1 to Dec. 31, $——."

A footnote states: "The deductions authorized shall include all expense items under the various heads acknowledged as liabilities by the corporation making the return and entered as such on its books from Jan. 1 to Dec. 31 of the year for which the return is made. This form properly filled out and executed must be in the hands of the Collector of Internal Revenue for the district in which is located the principal office of the corporation making the return on or before March 1."

Therefore, the subject of depreciation has been removed from the realm of theory. Heretofore a few states have required returns to be made on this subject through their commissions having jurisdiction, notably the Public Service Commissions of New York and Wisconsin. The Interstate Commerce Commission has required a depreciation charge only by companies the greater part of whose operated mileage is in states where this is required.

Therefore, street railway companies must now decide whether for the year ended Dec. 31, 1909, they will refuse to acknowledge as a liability the amount of current depreciation and in that event possibly cut themselves off from claiming depreciation for this period as a part of the cost of operation in any case of proposed rate regulation, imposition of additional service or limitations of rate of return on capital; or, on the other hand, by adopting a reasonable plan for charging depreciation offer proof that this is a conservatively managed business.

DIVERGENT RULINGS OF PUBLIC AUTHORITIES.

As to what this charge for depreciation should include, there is some divergence in the rulings of the four authorities in question, as follows:

1. The Interstate Commerce Commission provides for electric carriers two accounts called "depreciation of way and structures" and "depreciation of equipment," while for steam railroad companies no charge is required for depreciation with respect to way and structures, but merely for equipment.

2. With regard to the Public Service Commissions of New York it was originally intended that the State railroad commissions having jurisdiction over electric railways would follow the practice adopted by the Interstate Commerce Commission, but these commissions have so enlarged and amplified it as to be in effect a different classification. Thus all replacements under the heading of "way" are to be charged to the proper maintenance accounts and not to the depreciation account. The New York commissions also, as to electric light and gas companies, provide that depreciation is to be charged in operating expenses under general and miscellaneous expenses rather than under maintenance.

The United States and New York commissions, therefore, do not agree as to the policy of charging depreciation as between steam and electric transportation, or as between public utilities frequently under one capitalization.

The Public Service Commissions of New York have under operating expenses two accounts, namely, "depreciation of way and structures" and "depreciation of equipment." They provide that the "amount estimated to be necessary to cover such wear and tear and obsolescence and inadequacy as have accrued during any month shall be based on a rule determined by the accounting corporation." Apparently, they provide that such an account shall cover not only the actual renewals necessitated by complete depreciation, but also the month's accruals of present or incomplete depreciation due both to wear and tear and also to the so-called obsolescence and inadequacy. This double renewal charge is not financially practicable under present rates of fare and has not been forced.

3. The law under which the Wisconsin commission is working seems to be tempered with common sense, recognizing that a difference exists between theory and practice. This law provides that: "Every public utility shall carry a proper and adequate depreciation account whenever the commission, after investigation, shall determine that such depreciation can be reasonably required" * * * and that "the commission shall provide for such depreciation in fixing the rates, tolls and charges to be paid by the public."

Under the uniform classification of accounts of the Wisconsin commission it is provided that: "Every electric railway shall carry a proper and adequate depreciation reserve to cover the full replacement of all tangible capital in service. There shall be opened a depreciation account, to which shall be charged monthly, crediting the depreciation reserve, an amount equal to one-twelfth of the estimated annual depreciation of the tangible capital in service of the railway, or as near that amount as the finances of the property will permit."

As tangible property comprises all land and its improvements, it is conceivable that the intent of the commission is to allow for the appreciation of value of real estate, which seems to be contrary to the orders of the other commissions.

4. The Bureau of United States Internal Revenue, which has in charge the collection of the new corporation tax, apparently treats the subject of depreciation as differentiated between complete depreciation or abandonment or destruction due to obsolescence, inadequacy, age, action of the elements or otherwise, and incomplete or partial depreciation due to wear and tear and obsolescence.

Complete depreciation, unless already charged out under the depreciation account or the maintenance accounts, is provided for apparently under one of the deductions from gross income as follows:

"5 (a). Total amount of loss sustained Jan. 1 to Dec. 31, $——." The definition covering this item is as follows:

"Losses.—The deduction for losses must be in respect of losses actually sustained during the year and not compensated by insurance or otherwise. It must be based upon the difference between the cost value and salvage value of the property or assets, including in the latter value such amount, if any, as has in current or previous years been set aside and deducted from gross income by way of depreciation as defined in the following section and not been paid out in making good such depreciation."

The ruling on "depreciation" provides for the year's accrued or incomplete depreciation due to exhaustion, wear and tear or obsolescence. Complete depreciation due to exhaustion and wear and tear is apparently to be charged under the heading of "expense of maintenance and operation," and complete depreciation due to obsolescence, etc., under the above deduction for losses unless formerly provided for by the depreciation fund. This ruling is as follows:

"Depreciation.—The deduction for depreciation should be the estimated amount of the loss, accrued during the year to which the return relates, in the value of the property in respect of which such deduction is claimed that arises from exhaustion, wear and tear, or obsolescence out of the uses to which the property is put, and which loss has not been made good by payments for ordinary maintenance and repairs deducted under the heading of expenses of maintenance and operation or in the ascertainment of gross income. This estimate should be formed upon the assumed life of the property, its cost value, and its use. Expenses paid in any one year in making good exhaustion, wear and tear, or obsolescence in respect of which any deduction for depreciation is claimed must not be included in the deduction for expense of maintenance and operation of the property or in the ascertainment of gross income, but must be made out of accumulative allowances deducted for depreciation in current and previous years."

This ruling seems to be carefully drawn, although I doubt the propriety or practicability of making an allowance for incomplete or accrued depreciation due to the so-called obsolescence or inadequacy. In the first place, there is no adequate standard for gaging the probable life of any part of the construction or equipment of a street railway, the discarding of which depends on its becoming obsolete or inadequate. A careful distinction should be made between the useful life of the article in question based upon wear and tear or the action of the elements and the useful life before becoming obsolete or inadequate. Wear and action of the elements are dependent upon service and time; obsolescence and inadequacy are dependent upon changes in the art, which may take place within one year or 50 years. Considering the property as a going concern, an article cannot be said to be 50 per cent obsolete by the use of any present standard; it is either obsolete or not obsolete, 100 per cent obsolete or a proper standard. On the other hand, an article can be said to be 50 per cent worn out either by wear and tear or by the action of the elements.

Furthermore, obsolescence and inadequacy usually occur for business or economic rea-

*A paper by Frank R. Ford of Ford, Bacon & Davis, read at the mid-year conference Jan. 26-28 of the American Street and Interurban Railway Association.

sons. The new standard will produce more net profits than the old one, even allowing for interest and depreciation on the new standard, together with interest on the old. If this were not so the old article would not become obsolete. Consequently, from a business standpoint, renewals due to depreciation from obsolescence can be capitalized. In the street railway business the notable examples of obsolescence from a change in the art have been the change from horse to the cable system, and from the cable to electric. From the rates of fare in force it would generally have been impossible to have made these changes out of income, and certainly so with the increased length of ride and use of transfers of today. If a provision had been in force at the time requiring such a change we would probably still be burdened with the older system in the same manner as the city of Edinburgh is today suffering from the operation of its cable system.

From the standpoint of the public, if renewal or change of the whole system due to obsolescence before wearing out has to be charged to income, either the present rates of fare must be raised or the replacement cannot be made. It would appear, therefore, that the publics' interest is thus served by capitalizing such charges, if otherwise not financially practicable.

The very rulings of these public service commissions that obsolescence shall be charged to income has already had the effect of increasing largely the useful life of all physical property and of delaying changes in the art.

Three different policies of providing for the upkeep of physical property out of income may be followed:

1. Charging out when the expenditure is made.

2. Charging out over a period of expenditure, and

3. Accruing in advance of need.

I believe that a combination of these three methods will produce the most satisfactory results and will correspond with the best steam railroad practice of the past 25 years.

Apart from the technicalities of accounting, I think that depreciation should be divided and charged as follows:

1. Complete depreciation.

(a) That due to wear and tear should be charged to proper maintenance accounts.

(b) That due to obsolescence, inadequacy, age or destruction by any cause should be written off from current income or from past accumulations of profit and loss account, if financially practicable, or, if not, such obsolescence or inadequacy should be capitalized.

2. Incomplete depreciation.

(a) That due to wear and tear, if likely to fall due in large amounts at irregular intervals, should be provided for by a depreciation fund.

From a practical standpoint the method which I have used in working out this problem recently for a street railway property operating both on paved streets and private right-of-way, has been as follows, referring to the balance-sheet accounts of the physical property:

Right-of-Way Real Estate.—Appreciation over original cost is estimated to provide partly for depreciation of the intangible propery included in the balance sheet.

Track and Roadway.—Renewal of ties, special work and paving is charged direct to maintenance. To provide for the renewal of rails, including the labor, ballast, joints, ties and paving occasioned by such renewal, there is charged annually to a depreciation fund such an amount as will provide the cost of the renewal when it is made, the remaining life of each section of track construction being estimated.

Electric Line.—Renewal of poles, wire and fixtures is made through maintenance.

Real Estate Used in Operation of Road.—Appreciation over original cost it is estimated will more than provide for depreciation on buildings.

Buildings. — Repairs and renewals are charged to maintenance. Depreciation due to obsolescence or inadequacy will be more than covered usually by appreciation on real estate; if not, upon discarding the building any net depreciation should, where financially practicable, be written off.

Investment Real Estate.—Appreciation is estimated to provide partly for depreciation of intangible property.

Power-Plant Equipment.—Renewal necessitated by wear and tear is provided for from maintenance. Any articles retired through age or inadequacy should, where financially practicable, be written off.

Shop Tools and Machinery.—Renewals are made from maintenance. An annual inventory is taken and book values increased or decreased accordingly.

Cars, Including Electrical Equipment.—Physical wear and tear are provided for from maintenance. Any car or class of cars upon being retired should be written off, where financially practicable, unless provided for by car equipment trust or other sinking fund.

The depreciation fund should be available in cash when needed. With this in mind, it may be invested in the company's salable securities and in some cases in additions to property.

The depreciation fund is essentially a financial problem, the solution of which is apparently by law left to the directors of the corporation, as they are empowered to determine the amount of current income to be set aside for working capital and the amount of dividends to be declared. It is questionable if utilities commissions can lawfully impose rules for the charging of depreciation in cases where the physical property is fairly maintained and securities properly issued. I believe that no hard and fast rule can be laid down for charging a fixed amount to such a fund month by month or year by year; the proper amount to be charged should be known, and if in lean years this amount is not laid aside, in prosperous years the deficiency should be made up. It might even be necessary to use this fund for other purposes than renewal of physical property, due to business contingencies unforeseen.

This program, I believe, will provide for the upkeep of the physical property until another change in the system occurs, such as from the cable to electric, if it ever does.

For the company mentioned, to which we have applied this policy of charging depreciation, I find that it results in a charge to depreciation fund of about 3 per cent of the gross earnings in addition to charges for renewals in the maintenance account, which, with current repairs, usually average about 10 per cent of the gross earnings, making a total of 13 per cent, to which must be added the amount written off for the abandonment of property due to obsolescence or otherwise, so that the total would probably be 15 per cent of gross earnings. The proper amount to be charged to a depreciation fund varies with every property, and should be carefully estimated as a factor of the physical cost, although it has been here stated, for convenience, as a factor of the gross earnings.

On the other hand, the theoretical depreciation fund arrived at by guessing at obsolescence and assuming a given life for each article of the construction and equipment based on the past 25 years' physical history of horse, cable and electric railways during their development to the present apparently well settled standards will involve a charge of usually from 10 per cent to 25 per cent of the gross earnings. Adding to this the current repairs and renewals covered in the usual maintenance accounts, of some 10 per cent of gross earnings additional, the total charge for maintenance, renewals and depreciation will amount to from 20 per cent to 35 per cent or more of the gross earnings. With the present insufficient return upon the capital actually invested in street railway enterprises, it would not be reasonable to expect these corporations to make appropriations for depreciation based upon this theory of obsolescence.

Referring to the methods currently employed for providing for the upkeep of the property from earnings, an examination of the public reports of a number of street electric railway companies in the United States, Canada and Great Britain shows that there is no standard practice; each company is apparently actuated by its financial condition and managerial opinions. The range of methods employed to return income into the property is as follows:

METHODS OF CHARGING RETURNS INTO PROPERTY FROM INCOME.

1. From the current year's income.
    1. Actual cost in operating expenses charged for
        1. Maintenance.
        2. Renewals.
        3. Extensions, additions and betterments.
    2. Apportioned in operating expenses for
        1. Renewals.
        2. Depreciation.
        3. Car and equipment obligations.
    3. Apportioned in fixed charges for
        1. Renewals.
        2. Depreciation.
        3. Car and equipment obligations.
        4. Sinking funds, if permanently to retire capital.
        5. Contingent funds.
    4. Apportioned from net income or surplus for
        1. Renewals.
        2. Depreciation.
        3. Extensions, additions and betterments.
2. From accumulated profit and loss from operation.
    1. Apportioned to physical uses for
        1. Renewals.
        2. Depreciation.
        3. Extensions, additions and betterments.
    2. Apportioned to adjust accounts of
        1. Assets affecting maintenance, renewals, etc.
        2. Liabilities affecting maintenance, renewals, etc.
3. From profit and loss other than operation not applicable to dividends.
    1. Premium on securities sold. Held and used for extensions, additions, etc.
    2. Profit on assets sold and reinvested in property.

The rights of stockholders as to preservation of original investment and return upon securities are involved in any consideration of depreciation or the return of income into property. Should stockholders, who in early years have taken the risk and have provided for and outlived early losses of operation, be subject to the obligation of providing for wholly theoretical wasting of capital in the future?

Provision for charging depreciation has been made in the new franchises which have recently been granted to the street railway companies at Chicago and Cleveland. In the Chicago franchise, beginning February, 1910, it is provided that there shall be set aside 8 per cent of the gross earnings as a renewal fund, in addition to 6 per cent and as much more as may be necessary for current repairs or maintenance. The total charge for current maintenance, depreciation and renewals in Chicago will, therefore, as a minimum, be 14 per cent of the gross earnings.

In the Cleveland franchise it is provided that an average of about 5 cents per car mile shall be applied to maintenance, depreciation and renewal account, which is about 22 per cent of the gross earnings.

From the published reports of the twenty largest electric railway companies in the United States and Canada it is apparent that thirteen are making specific charges to income for depreciation or renewals; these, in percentage of gross earnings are as follows:

In all of the above cases these charges do not represent the entire return into the property from income. When we include all charges for maintenance, reserves, depreciation and other funds, special appropriations and unappropriated surplus these figures are increased largely.

City.	Year ending.	Depreciation— Amount.	Per cent gross earnings.
Baltimore-United Rys. & El. Co.	Dec. 31, 1908	$813,751 B.F.	11.9
Milwaukee Elec. Ry. & Lt. Co.	Dec. 31, 1908	475,127 E.	10.0
Minneapolis-Twin City R. T. Co.	Dec. 31, 1908	544,000 C.	8.5
Buffalo-Internat. Trac. Co.	Dec. 31, 1908	403,280	7.7
St. Louis-United Rys.	Dec. 31, 1908	321,500	5.0
Montreal St. Ry.	Sept. 30, 1909	175,000	4.5
Detroit United Ry.	Dec. 31, 1908	300,000 A.	4.2
Toronto Railway	Dec. 31, 1908	150,000	4.2
Washington Ry. & Elec. Co.	Dec. 31, 1908	150,323 B.	4.0
Washington-Capital Traction Co.	Dec. 31, 1908	70,117 B.	3.8
Boston Elevated Ry.	Sept. 30 1909	200,000	1.4
Brooklyn Rapid Transit Co.	June 30, 1909	148,806 G.	.7
Kansas City Ry. & Lt. Co.	May 31, 1908	829,814 D.	13.7

NOTES.

A. Also set aside $50,000 to contingent liability reserve, including which the percentage of gross earnings is 4.9.
B. Renewals and betterments.
C. Including interest on fund, which consists of company bonds, this percentage is 9.
D. Written off surplus applicable to 1908 and prior years.
E. Includes Milwaukee Light, Heat & Traction Co.
F. Subject to further distribution by directors.
G. In the last six years $5,400,000 discount on bonds has been written off.

For the last year obtainable for various groups and individual street railways of this and foreign countries the total amounts returned into the property from income have been the following percentages of gross earnings:

RETURN INTO PROPERTY FROM INCOME.

Company, State, etc.	Kind of service.	Year ending.	Per cent gross earnings.
United States Census, 1907	939 electric railway companies, including small amount of electric light	Dec. 31, 1907	17.1
United States Census, 1902	799 companies, all electric railways, including some electric light	Dec. 31, 1902	17.4
State of N. Y.—District No. 1	Electric railways	June 30, 1907	11.7
State of N. Y.—District No. 2	Electric railways	June 30, 1907	19.9
State of Massachusetts	Electric railways	Sept. 30, 1908	15.3
United Rys. & Elec. Co., Baltimore	Urban and suburban railway	Dec. 31, 1908	21.7
Brooklyn Rapid Transit Co.	Surface and elevated railway	June 30, 1909	19.3

Capital Tract. Co., Washington	Urban and suburban railway	Dec. 31, 1908	14.1
Philadelphia Rapid Transit Co.	Surface, elevated, subway railway	June 30, 1909	9.7
Great Britain and Ireland	Municipal and company railways	Dec. 31, 1907	28.7
Great Britain and Ireland	Municipal railways	Mar. 31, 1908	31.2
Great Britain and Ireland	Company railways	Dec. 31, 1907	22.2
Glasgow Corporation Tramways	Municipal railways	May 31, 1909	42.6

The ability of large manufacturing corporations to make the consumer pay for the charge for depreciation and the great difference between the financial condition of those properties and that of street railway properties are shown by a recently advertised letter of the Western Electric Company to its bankers, dated Jan. 21, 1910, from which I quote the following:

"The stated net profits are after deducting liberal charges for depreciation, pusurant to the well-known policy of all companies controlled by the American Telephone & Telegraph Company. This is evidenced by the fact that the book valuation of real estate and plants covered by the mortgage has been reduced to 51 per cent of their actual cost."

Under the present well-known conditions of the street railway industry this method of treatment is an impossibility today. After all is said, the treatment of depreciation is largely a financial problem.

Harbor Improvements in Argentina—The Argentine Government has approved a contract with the Port Argentine Great Central Railways Co. (Limited), by which the latter agrees to construct, within the next five years, a deepsea harbor, where boats drawing 30 ft. can enter in ordinary low water, on the estate called Rincón de Lopez, near Punta de Lopez, near Punta de las Piedras on Samborombon Bay, nearly opposite Montevideo. This company is capitalized at $19,466,000 in shares and $38,932,000 in debentures. The Paris banking firm which is now building the Letschberg tunnel to connect with the Simplon has subscribed all the money necessary to complete the first section of the port, and a French banking syndicate has contracted to build the port works and will send dredges to Samborombon Bay at once to begin operations.

The port will be composed of a series of parallel docks, of the same level as the entrance channel and situated on either side of it, with embankments to be built along the channel to allow the ships to pass freely and to facilitate loading and unloading. The docks are to be 1,640 ft. apart, 3,215 ft. in length, and 1,050 ft. in width. The entrance channel runs east by west, almost parallel with the coast line; its total length will be nearly 50,000 ft.; its depth will be 328 ft. in the middle and 33 ft. along the walls. The moles are to be hard Austrian wood, already contracted for. There are to be thirteen storage sheds of wood and galvanized iron, to be built at the same time as the docks, whose capacity will be approximately 100,000 tons, representing a total movement of 800,000 tons per year. Three railways will be laid down in front of these sheds, and the goods will be loaded into the cars from the ships in the docks and channel by cranes. The motive power will be electricity, supplied by a central power house with installations for 500 HP., which can be increased as the port works are extended. It is planned to build several short railways in the port for use of various steamship companies. The port dues are not to exceed those of Buenos Aires.

The company will have the exclusive use of all land situated within 9.3 miles around the port; land necessary for custom-houses and other government buildings, coal deposits, streets and parks, and other public purposes being reserved for the Government. All such structures and public improvements are to be laid out in accordance with a plan to be approved by the President of the Republic. Not less than $15,572,000 must be spent on the entrance channel. The port is to be called "Puerto Argentino," and will become the property of Argentina after 99 years.

A model city will be built by the company around the new port. Land is being sold there now for $2.50 a sq. ft., and its value is rapidly rising. The 9.3 square miles bought by the company cost it $316,322.

Earth Road Construction in Iowa.—During the past year Poweshiek county, Iowa, has been constructing earth roads by means of a county road grading gang. The operation of this gang is briefly described in the Report of the Committee of Roads and Pavements of the Iowa Engineering Society. Poweshiek county is a rolling county and a large per cent of the work there consisted in reducing heavy grades and filling across the low stretches of road between the hills. The road machinery consisted of an elevating grader, blade grader, road roller, slips, plows, etc. This crew was equipped with a sleeping tent for the men, horse tent, and a cook wagon. Camp was moved for each two miles of road. The past season was a very unfavorable one for this kind of work and the work was not started until late. These two circumstances combined to keep down the road mileage actually constructed below what was anticipated. About nine miles of road was graded at a cost of between $600 and $700 per mile. In Sioux county, under the direction of the highway commission a stretch of earth road was graded between Alton and Orange City, preparatory to graveling. This road was three miles long. The cost for the three miles being about $1,300, or at the rate of $433 per mile. This includes the cost of shipping the outfit from Onawa and considerable tree trimming and similar expense.

Another stretch of road 1½ miles long, out of Ruthven, was constructed at a total cost of $850, or at the rate of $586 per mile. The figures given for all of this work include a considerable amount of hilly road and the filling of the low stretches.

A Consolidation of Engineering-Contracting—Contract News—Engineering World—The Dirt Mover.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

Municipal Ownership in Vienna.

The city of Vienna, Austria, which has developed municipal ownership to a degree far beyond that of any other great city, is not having exactly a happy time with its many enterprises, according to a special correspondent of the Chicago Daily News. The city owns and operates not only gas and electric light plants and street railways but also such diversified undertakings as slaughter houses, a brewery, cemeteries, funeral undertaking and funeral insurance, life insurance and savings banks, besides several other minor enterprises. The first undertaking acquired by the city was the street tramway system. This was in 1903 and was only accomplished after a long and bitter fight with the stockholders of the company. Altogether, according to the correspondent of the News, the city has invested $28,000,000 in the tramway system and greatly developed and improved the service for an average yearly return of about $500,000. This, it may be remarked, is considerably less than the city would have received without any investment at all, for the old company's charter provided for the payment to the municipality of 9.8 per cent of the gross earnings. The old company also paid about $200,000 a year to the municipality for taxes. To add to this showing it may be stated that the fares have been raised all around. The next undertaking was the erection of municipal electric works at a cost of $12,000,000, the original estimates for the power plant being exceeded by nearly $5,000,000. In connection with these works the city bought out two private companies for a total of $5,000,000. The electrical works last year showed a clear profit of $1,000,000, but this is stated to be due largely to the fact that the tramways are charged an exorbitant price for the power supplied. As to the consumers, they have never received any reduction in price for electricity supplied for lighting purposes. An entirely new plant for manufacturing gas was erected by the city, and last year it showed a profit of $700,000, but the consumers could have gained nothing by this, for gas for all purposes, lighting, heating and power, costs in Vienna about 97 cts. per 1,000 cu. ft., which is said to be the highest price in all Europe, with the expection of Paris. Another undertaking of the municipality was the purchase of omnibus lines. This investment resulted last year in a loss of about $88,000, which it is estimated will be doubled this year. The public slaughter houses were also a losing investment of the municipality. It was thought that these would keep down the wholesale price of meat by providing a regular market, and also by competing with the butchers would give the public cheap meat. It is stated that neither of these expectations were fulfilled, and that in addition the slaughter houses entailed a loss to the city of $188,000 last year, which will probably be considerably increased this year. The most unfortunate venture of the city, not so much from the financial loss, but from the scandal involved, was the municipal brewery. The brewery has been carried on with a steady annual deficit. The latest acquisition of the municipality was two of the largest funeral undertakings in the city, which in fact almost monopolized that trade. In the first year this project netted $45,000 but much dissatisfaction is said to exist because the tariff for the cheaper classes of funerals has not been reduced in accordance with public demands.

The Doings of the Week.

At the state election in Oklahoma on June 11, the amendment to the constitution providing for the repeal of the clause that prohibits the purchasing of new railroads by established lines was defeated by a majority of about 20,000.—Announcement has been made that three of the most important branch lines of the Chicago, Milwaukee & Puget Sound R. R. are to be opened for traffic this month. These are the Gray's Harbor, Worden and St. Mary's branches. The St. Mary's branch will be opened within a few days. It reaches the timber and mining activities along the St. Mary's River, while the Worden branch goes into the wheat region of the Big Bend country.—The first train crossed the Miles Glacier bridge over the Copper River in Alaska on May 30, four months ahead of the original schedule. The completion of this important link in the Copper River & Northwestern Ry. gives through rail connection to within 23 miles of the mouth of the Chitina.—The State Road Commission of Maryland and the highway division of the Maryland Geological Survey were consolidated last week in accordance with a bill passed by the last Legislature. In the future all road work will be done under the supervision of the Road Commission.—Two good sized railroad construction contracts are to be let shortly. One of these is the contract for constructing the 86-mile line from Virginia, Minn., to Duluth, Minn., for the Canadian Northern Ry., which has been mentioned a number of times on this page. The other contract is for the construction of double track from Pueblo, Colo. to Walsenburg, a distance of 50 miles, for the Colorado & Southern and the Denver & Rio Grande. Bids for the latter work are to be in by June 20. Bids for the Minnesota work have already been taken and it is expected that an announcement as to the award of the contract will be made shortly.—Haney, Quinlan & Robertson, of Toronto, Ont., have just been awarded the contract for Sec. 4 of the Ontario-Rice Lake Division of the Trent Canal in Canada, the contract amounting to about $1,000,000.—A large drainage job is now being advertised by the Drainage Commissioners of Bolivar County, Mississippi. The bids are to be opened at Cleveland, Miss., at 2 p. m., July 5, and the work calls for approximately 1,155,000 cu. yds. of earth excavation in connection with the improvement of the channel of the Bogue Phalia.—Among the railroad construction contracts let recently are the following: The Carland Construction Co., Toledo, O., for constructing the new line of the Ohio Electric Ry., from Hamilton, O., to Middletown; Ramage, Wolfe & Co., Fairmount, W. Va., for constructing seven miles of road between Clarksburg, W. Va., and Mount Clare for the Clarksburg & Western Traction Co.; A. Guthrie & Co., St. Paul, Minn., for grading 40 miles of line between Frannise, Wyo., and Fromberg, Mont., for the Chicago, Burlington & Quincy R. R.; J. H. Flick Construction Co., Chicago, Ill., for constructing the interurban line from St. Joseph, Mo., to Savannah, Mo.; Hughes O'Rourke Construction Co., Dallas, Tex., for three bridges for the St. Louis Southwestern extension from Gatesville, Tex., to Comanche.

The Contractor and the Stage.

Playwrights have begun to recognize the dramatic possibilities of engineering and in several successful plays produced recently the plots have been based upon construction work. In several of these plays the hero or the near hero is a civil engineer and the contracting profession is not represented by even a spear carrier. After seeing one of these plays a contractor decided that he would write a play in which the hero would be a plain but honest contractor who would cop the girl and the wealth in the last act and live unhappily ever after. He wrote his play and has given us the privilege of giving a synopsis of it. This we have done for the purpose of showing that there are strong dramatic possibilities in the life of a contractor. The plot of the play, in brief, is as follows: Tom Jones, a young contractor, is in love with Mame Brown, daughter of Dunne Brown, president of the Hot Air Line. Brown awards Tom the contract for building a 100 mile railway, one of the conditions being that if the work is completed by 10 a. m., Nov. 15, Tom secures the daughter as a bonus; if the work is unfinished at that time Dunne Brown gets the road for nothing. Goodrich Mudd, 1st vice president of the road, is also in love with Mame but is spurned by her, as he already has two wives. He plots to foil Tom and is ably assisted by J. Little Work, 2d vice president of the road. Bill Smith, assistant chief engineer of the road, is a friend of Tom's and comes to his rescue at various critical moments. A summary of the four acts follows:

Act 1. Grading camp at night. Enter foreman, skinners, hoboes, waterboys, etc., singing, "It's 14 miles to the nearest drink, and you have to walk all the way." Supper; song, "What, beans again?" Mule skinners by light of banjo torches skin two mules that had died from fright of the sight of oats.

Act. 2. Scene in Tom Jones's tent. Enter bill collectors for feed men, grocerymen, butchers, etc., etc. "I'm busted." Bill Smith: "Take this $10,000, my last month's pay." It begins to rain; it pours; high water; floods; tempest; hurricane. Glanders in the stock. Steam shovel busted. Concrete mixer blown-up. "There's deviltry in the air."

Act 3. Scene 1, headquarters of chief engineer. "We allow no rock in this estimate, it's all earth." "My God! it cost me $1.25 per cu. yd." Scene 2. Court. 56 experts on one side, 56 on the other. "The judge finds that this is rock and holds you to the terms of the contract."

Act 4. Site of bridge, 9:45 a. m., Nov. 15. Pile drivers, hoists, cableway from distant cliffs to bridge site, etc. Tom Jones discovered tied beneath hammer on ponderous pile driver. Goodrich Mudd and J. Little Work prepare to let hammer drop. Mame Brown and Bill Smith appear on distant cliff. "My God! We're too late." "Quick, the cableway bucket." Bang! Bang! Just in time. Ten minutes to finish the work. In with a pile. "Who'll run the engine?" "I, Mame Brown." "It's down. The railroad is completed. I've won my bonus."

The United Railways & Electric Co., of Baltimore, Md., has completed plans for the extension of its lines to Orangeville, Baltimore county, Md.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ALABAMA.

The Tuscaloosa Mineral Ry. Co. now has surveys in progress for its projected 18-mile line from Tuscaloosa east via Holt to Brookwood, Ala. The capital for construction has not been secured as yet, and the time for awarding construction contracts has not been decided upon. W. Finnell, Tuscaloosa, Ala., is Chief Engineer, and F. G. Blair, Tuscaloosa, is President. A. S. Vande Graff, Tuscaloosa, Ala., is also interested.

COLORADO.

The Colorado & Southern Ry. Co., in connection with the Denver & Rio Grande R. R. Co., has asked for bids on construction of double track from Pueblo to Walsenburg, a distance of approximately 50 miles; bids to be in on June 20. H. W. Cowan, Denver, Colo., is Chief Engineer of the Colorado & Southern Ry.

The Plateau Valley Ry. Co., which projects a 24-mile railway along Plateau Creek from Collbrain to the Rio Grande Junction R. R., near Palisade, has completed surveys, and has secured the promise of the necessary capital for the construction of the line. Construction contracts are to be let shortly. Paul Blount, 322 Century Bldg., Denver, Colo., is Chief Engineer, and J. J. Yeckel, Century Bldg., Denver, is President.

GEORGIA.

The Western of Georgia R. R. has completed surveys and has secured the capital for the construction of its projected 36-mile line from Franklin, Heard County, via Herman to Aberdeen, Fayette County, Georgia. The date for awarding construction contracts has not been set as yet. R. M. Hull, Newman, Ga., is Chief Engineer.

ILLINOIS.

The Decatur Southern Traction Co. has completed surveys and has secured the capital for the construction of its projected 32 to 33-mile line from Decatur to Pana, Ill. Construction contracts are to be let within 60 days. R. McCalman, Decatur, Ill., is Chief Engineer and J. Nordeus Child, New York, is President. J. J. Pierpont, Pana, Ill., is also interested.

IOWA.

We are advised that active operations on the proposed Davenport-Muscatine interurban line will not be commenced for at least six months or a year. Joseph F. Porter, president of the Tri-City Ry., Davenport, Ia., is interested.

KANSAS.

The Continental Construction Co., Caney, Kan., which has the contract for constructing the first 50 miles of the Cherryvale, Oklahoma & Texas Ry., including bridging, track laying, etc., has completed the grade for the first six miles. The contract includes 578,000 cu. yds. of earth excavation and embankment, 63,000 cu. yds. of rock excavation, 1,444,000 cu. yds. of over haul, one 80-ft., one 150-ft. and one 200-ft. steel bridge and 3,100 lin. ft. of wood trestles. B. J. Dalton, Lawrence, Kan., is chief engineer.

MONTANA.

White Brothers, First National Bank bldg., Missoula, Mont., who have the contract for constructing 35 miles of line for the Big Blackfoot Ry. from Clearwater to a point east of Ovondo, have let sub-contracts to the following: A. L. Walker, Missoula, Mont. M. Tobin, Hamilton, Mont.; C. L. Rummelhort, Hamilton, Mont.; S. J. Wallace, Hamilton, Mont.; and Meredith & Davis, Hamilton, Mont. They still have about 500,000 cu. yds. to be sub-let, but sub-contractors are coming in rapidly. The work is very good team work and the prices are good. The contract includes 1,000,000 cu. yds. of earth excavation and 200,000 cu. yds of rock excavation. Matter of bridges is undecided as no decision has been reached as to channel changes. It is expected that further extensions of the Big Blackfort Ry. will be made in the very near future.

NEW YORK.

The New York State Public Service Commission is now passing upon the application of the Southwestern New York Traction Co., for a certificate of convenience and necessity and for leave to issue bonds for the construction of its 15-mile line from Bolivar to Wellsville, N. Y. It is expected that favorable action will be taken by June 18. The construction of the line will not begin until this approval and consent, which is a preliminary requirement by the New York State law, is obtained. C. M. Van Kuren, Bolivar, N. Y., is President, and A. J. Matson, Bolivar, is secretary.

OKLAHOMA.

The Erick Northeastern R. R., which projects a 42-mile line from Erick, Okla., to Cheyenne, Okla., has secured the capital for the construction of its line, and construction contracts will be let soon. The road will also be built from Erick, Okla., to Englewood. C. P. Banning, Erick, Okla., is President.

Dan Sweeney & Co., Stillwater Okla., who have the contract for constructing the section of the Oklahoma Public Service & Interurban Lines between Stillwater and Morrison, Okla., as noted in our June 1 issue, intend to sub-let eight or ten miles of this work. Sub-contractors can see Mr. Sweeney at his camp at Stillwater. C. R. Cain has been awarded one of the sub-contracts on the work. Mr. Sweeney's contract includes 272,000 cu. yds. of earth and rock excavation. The M. B. Ryan, Bridge Co., Shawnee, Okla., has the bridge work.

OHIO.

The Loramie & Minster Ry Co. has completed surveys and has secured the capital for the construction of its projected three-made line from Minster to Loramie. The company will construct the line itself. John Ratterman, Lorain, O., is President, and J. W. S. Reigle, Findlay, O., is Engineer.

WISCONSIN.

Alex McGravyock has finished his work on the Burlington and has moved his plant to West Allis on the Northwestern. He would like to have some of his old employes on the work. E. J. McLonne will have charge of the work.

Power Developments, Levees, Drainage and Irrigation Works.

COLORADO.

Bids are asked by the Rio Grande Reservoir & Ditch Co. at its office, Room 420 Symes Building, Denver, Colo., until 2:00 p. m., July 2d, for the furnishing of materials for and the construction of a storage reservoir at Santa Maria Lake, Mineral County, Colorado. The work will consist mainly of a 48-inch diameter continuous wood stave pipe 8,000 ft. long, a concrete lined canal 8,000 ft. long; a hydraulic fill, or earth dam containing 265,000 cu. yds. outlet tunnel 600 ft. long, outlet canal 3,000 ft. long, spillway, diversion dam, valve chamber, valves, etc. Bids will be received for any portion of the entire work as above stated. Plans, specifications and form of contract may be seen and proposal blanks obtained at the office of the company, and at the office of Thomas W. Jaycox, Consulting Engineer, No. 1608 Broadway, Denver, Colo.

ILLINOIS.

Contract was let on June 9 to the Western Concrete Bridge Co., 1st National Bank bldg., Chicago, Ill., for the reconstruction of the concrete dam for the Danville Water Co. The contract prices were as follows: Concrete, including coffer dam and removal on sections of present dam, $11.80 per cu. yd.; earth excavation, $1 per cu yd.; shale excavation, $2.50 per cu. yd.; extra steel reinforcement, 3 cts. per lb.

IOWA.

C. H. Sternberg & Sons, Chicago, Ill., have been awarded the contract at 5.94 cts. per cu. yd. for constructing the Pigeon Creek Ditch extension of 14 miles, for the Commissioners of Pottawattamie County. Bids for the work were opened June 5 at Council Bluffs, Ia. The work is divided into seven sections as follows: Section 1, 80,480 cu. yds.; section 2, 58,520 cu. yds.; section 3, 74,550 cu. yds.; section 4, 75,450 cu. yds.; section 5, 83,400 cu. yds.; section 6, 77,800 cu. yds. section 7, 28,000 cu. yds.

KENTUCKY.

The Eclipse Mining Co. is to let contracts at once for eight miles of railroad from Marion, Ky., to the Comodore Mines. Ed. F. W. Kaiser, Louisville Loan Bldg., Louisville, Ky., and Jno. W. Wilson, Marion, Ky., are interested.

John R. Gaines, County Surveyor, Court House, Louisville, Ky., is now making a survey for a system of drainage canals in the flat lands of Jefferson county. This system will be divided into two projects, one to include what is called the Mill Creek Valley, and the other the Pond Creek Valley. The Mill Creek project is pretty well under way and the commissioners will probably be able to let contracts on this work, by July 15th. The estimate for this whole work calls for the expenditure of about $90,000, of which $35,000 is available. Estimates on the Pond Creek project have not been completed but it will probably reach $150,000, of which about $40,000 will be available this year. Efforts are being made to get things in shape to let contracts on this work by August 1st or 15th.

LOUISIANA.

Bids are being asked by Maj. H. Burgess, U. S. Engineer, 3338 St. Charles Ave., New Orleans, La., until 11 a. m., June 27, as previously noted, for constructing about 350,000 cu. yds. of earth work in Lower Texas Levee District for the Fourth District of the Mississippi River Commission. The work is in the Loyd, Buck Ridge and Elk Ridge levees, situated in Tensas Parish, La., about 27 miles below Vicksburg, Miss. The work begins at lower end of the Burn levee recently enlarged, and extends down-stream to the upper end of Elk Ridge levee enlarged in 1904. The levee is to be enlarged on the river side. The Loyd levee contains 115,000 cu. yds.; the Buck Ridge levee contains 115,000 cu. yds., and the Elk Ridge levee contains 120,000 cu. yds.

MASSACHUSETTS.

The following bids per ton of 2,000 lbs. were received June 6 at the office of the U. S. Engineer, at Boston, Mass., for furnishing riprap stone in dike at Long Beach, Plymouth Harbor, Thomas Fitzgibbons, Beverly, Mass., $2.94; Lawler Bros., 16 City Sq.,

Charlestown, Mass., $3.44; Rowe Bros. Co., Richmond, Me., $3.97; The Breakwater Co., 1222 Arcade Bldg., Philadelphia, Pa., $2.43.

MINNESOTA.

Jerry Sherwood, Litchfield, Minn., was awarded the contract for 251,159 cu. yds of dredge work in connection with construction of Ditch No. 12 for Redwood County, bids for which were opened June 2 at Redwood Falls, Minn. Contract for County Ditch No. 11, all tile work, was let to Christ Anderson, Redwood Falls, Minn. The work is located in township of Delphi and Kintise, Redwood County, Minn.

R. A. Putnam, Valparaiso, Ind., has been awarded the contract for all open ditch work for Drainage District No. 1, of Des Moines County, bids for which were opened at Burlington, Ia., on June 9. The contract price ranged from 5 1-5 cts. to 8 cts. per cu. yd. The work includes: 6,900 ft. of 80 ft. ditch, 98,500 cu. yds.; 144,000 ft. of 60 ft. ditch, 1,208,500 cu. yds.; 8,300 ft. of 40 ft. ditch, 53,500 cu. yds.; 3,500 ft. of 20 ft. ditch, 5,800 cu. yds.; 45,200 ft. of 10 ft. ditch, 103,150 cu. yds.; 900 ft. of 8 ft. ditch, 9,100 cu. yds.

MISSISSIPPI.

Bids are asked until 2 p. m., July 5, by the Drainage Commissioners of Bolivar County, Miss., at Cleveland, Miss., for the improvement of the channel of the Bogue Phalia. The proposed improvement is nine miles in length and requires the excavation of 1,155,000 cu. yds. of earth. W. W. Boone, Cleveland, Miss., is Chief Engineer. The official advertisement will be found elsewhere in this issue.

NEW YORK

The Caldwell-Wilcox Co., Newburgh, N. Y., has been awarded contract 44 by the Board of Water Supply of New York City. This contract calls for furnishing, delivering and installing six 6-ft. by 15-ft. sluice-gates, twenty-five 5-ft. by 13-ft. sluice gates, four 5-ft. by 8-ft. back pressure sluice-gates, seven 5-ft. by 8-ft. sluice gates, six 5-ft. by 6-ft. sluice gates, three 4-ft. by 5-ft. sluice gates, eight 3-ft. by 5-ft. sluice gates, three 30-in. by 42-in. sluice gates, two 18-in. by 24-in. sluicegates, with operating mechanisms, 2 sets of drive-shafting and all appurtenances.

The Dravo Contracting Co., Pittsburg, Pa., was awarded Contract No. 80 by the Board of Water Supply of New York city. This contract, bids for which were opened May 24, calls for the construction of the Breakneck Tunnels, portions of the Hudson River Division of the Catskill Aqueduct, comprising about 710 ft. of plain concrete conduit, known as aqueduct in open cut, or cut-and-cover aqueduct, 17 ft. high by 17 ft. 6 in. wide inside, and a tunnel on the hydraulic gradient, about 1,055 ft. long, 17 ft. high by 13 ft. 4 in. wide inside, connecting by a shaft about 590 ft. deep with a deep pressure tunnel 14 ft. inside diameter and about 700 ft. long. The work is located in the Towns of Fishkill Dutchess County, and Phillipstown, Putnam County, N. Y.

Bids are asked until noon, June 27, by Col. W. M. Black, U. S. Engineer, Army Bldg., 39 Whitehall St., New York, for dredging in Newton Creek, N. Y., and Wallabout Channel, N. Y. The Newton Creek work consists in dredging a channel to a depth of 18 ft. below mean low water; in widening the channel at the bends and in the bridge approaches to the same depth, if so directed; and in removing the rocky shoal in the entrance to 19-ft. depth below mean low water. The rocky shoal in the entrance has been broken up by drilling and blasting and it is believed to be reduced to such sizes as are removable by the dipper of a dredge capable of satisfactory removing this class of material. The contractor will be required to remove all material encountered except unbroken ledge rock. The work calls for the removal of the following estimated amount of materials: Mud, sand, clay, etc., 46,000 cu. yds., scow measurement. Broken rock and boulders ½ cu. yd. in size or larger, 35 cu. yds. solid measurement. The amount of money available is $9,000.

OHIO

Bids are asked by the Director of Public Service of Lorain, O., L. B. Johnston, Clerk, until noon, June 21, for furnishing the necessary labor and materials for the ofllowing improvements in Black River: approximately 100,000 cu. yds; making fill on city property east of Black River and north of Erie Avenue Viaduct, approximately 15,000 cu. yds.; bids for these improvements will be considered either separately or combined.

W. J. Irwin, Greenville, O., and L. E. Irwin, Hamilton, O., composing the firm of Irwin Bros., have, as noted in our last issue, been awarded the contract for the construction of the Stant levee and road. The work is located along the east side of the Miami River from Trenton to Middletown, and includes 68,000 cu. yds. of earth for the levee and 12,200 sq. yds. of concrete slope. The excavation is team work.

PORTO RICO.

As previously noted, bids are being asked until 2 p. m., July 25, by B. M. Hall, Chief Engineer, Porto Rico Irrigation Service, Guayama, Porto Rico, for the construction in Porto Rico, of the Carite dam, containing 150,000 cu. meters of earth and loose rock, the Toro Negro dam, containing 15,000 cu. meters of earth and loose rock, and the Dona Juana Canal, 1 1-3 mile long. The estimated total cost is about $160,000. The approximate quantities involved in the construction of the Carite dam and appurtenances are as follows: Grubbing and clearing, 7 acres; excavation for outlet culvert, open cut, Class 1, 880 cu. meters; Class 2, 500 cu. meters; Class 3, 2,000 cu. meters; concrete in outlet culvert, 360 cu. meters; excavations of cutoff trenches, open cut, Class 1, 5,600 cu. meters; Class 2, 2,300 cu. meters; Class 3, 300 cu meters; backfilling and puddling cut off trenches, 8,200 cu. meters; concrete in diaphram, 400 cu. meters; concrete in spillway linings, 100 cu. meters; concrete in spillway weir, 40 cu. meters; handling and placing reinforcing steel and iron work, 20,000 lbs.; excavation for spillway, open cut, Class 1, 70,000 cu. meters; Class 2, 60,000 cu. meters; Class 3, 30,000 cu. meters. Alternate bids will be taken in the Carite Dam and appurtenances, the approximate qualities being the same except for the last three items. Under the alternative plan these items are as follows: hydraulic fill for spillway and borrow excavation, 120,000 cu. meters, embankment, and such excavation in spillway, 30,000 cu. meters. Plans, etc., may be obtained from the Bureau of Insular Affairs, War Department, Washington, D. C., on the deposit of $1.

CANADA.

The contract for the construction of section No. 4 of the Ontario-Rice Lake division of the Trent Canal has been been awarded to Haney, Quinlan & Robertson, care M. J. Haney, C. E., Toronto, Ont.

Extensions to the Cuba R. R. Co., in Cuba, totaling 180 miles, are to be opened within six weeks. This includes a line from Marti to Bayamo and San Luis with a 40-mile branch, giving the port of Manzanillo, on the Gulf of Guayacanabo, its first connection with the island by rail.

The Commercial Club of Beatrice, Nebr., has appointed a committee of which B. H. Begtole is a member, to take steps toward securing the construction of an extension of the Missouri Pacific railroad from Virginia to that city.

It is reported that the Maine Central R. R. has let a contract for the construction of an extension of its line from Rumford Falls, Me., to Lake Megantic, Compton County, where it will make a connection with the Quebec Central giving a much shorter route from the States to Quebec. T. L. Dunn, Portland, Me., is Chief Engineer of the M. C. Ry.

The Northern Pacific Ry. has completed surveys for a line running from Edgeley, N. Dak., through Burnstad in Logan county and Linton and Emmonsburg in Emmons county. This line will connect with the line now under construction running west of the river from Cannon Ball through Mott in Hettinger county and thence to connect with the main line of the Northern Pacific at Forsyth, Mont.

Stockholders of the Nevada United Mines Co., at a special meeting held at Denver, Colo., amended articles of incorporation so as to increase the capital stock to $3,500,000 and authorized a special bond issue of $500,000 to provide funds for the construction of a railroad from Ely, Nev., to the mines.

Surveyors are making rapid progress running lines for the proposed Esmond Branch of the Great Northern to Towner, N. Dak., or Rugby, and construction work will be completed this summer, it is said.

E. Heigho, President of the Pacific & Idaho Northern, Weiser, Ida., has announced that construction work will be completed from the present terminus into Meadows, a distance of 16 miles, this fall.

Construction work is to be started in July on the extension of the Rapid City, Black Hills & Western R. R., to the Coalfields. It is hoped to complete the work this summer. W. E. Moore, Rapid City, S. Dak., is General Manager.

The Tallahassee & Gulf R. R. has been incorporated with capital stock of $10,000. J. H. Norfleet, Ocklockee, Fla., is president and general manager. Others interested are P. D. Camp, J. M. Camp, Franklin, Va., and P. J. Norfleet, Newberry, Fla.

The Louisville & Nashville R. R. is now having plans made for a new depot and station to be erected on Alcaniz and Wright Sts., at Pensacola, Fla. The building, with sheds, will cover two blocks in length by half a block in width and will cost, it is estimated, nearly $250,000, including the money spent for the site.

The House of Representatives of the State Legislature of Massachusetts has passed the bill permitting the New York, New Haven & Hartford R. R. to purchase and operate the Berkshire Street Railway, in Berkshire County. The bill, which stipulated that certain short extensions of the Berkshire company's line shall be made, has already passed the Senate.

A. Guthrie & Co., St. Paul, Minn., have been awarded the contract for constructing the 40 mile line between Frannie, Wyo., and Fromberg, Mont., on the Chicago, Burlington & Quincy R. R.

Condemnation proceedings have been begun by the Great Northern preparatory to building a branch line of 350 miles from Haucks siding on the Billings & Northern to a junction with the main line at a point near Mondak on the Montana-Dakota line.

The extensions of the Mexico Northwestern Ry., to the Pacific Coast, noted a short time ago in these columns, will require a great deal of heavy work as the route selected is a difficult one. The Mexican Central R. R., before it became a part of the National system made a number of surveys in an endeavor to seek a practicable route over the mountains to the coast. As a result of these surveys, it was found that the grades encountered on both sides of the Sierra Madre would be very heavy, not only for short distances, but for long stretches, as well. The cost of construction through the country will be large and special locomotives for work on heavy grades will probably have to be provided.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Alabama Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys were started early this month for a new railroad from Decatur to the town of Falls City, located at Clear Creek falls, in Winston county, some 50 to 70 miles from Decatur. The survey was commenced at Basham's gap for the purpose of determining the best route to cross the mountain and the amount of grade required. When this is ascertained the survey will then be continued until it is completed all the way to Decatur. Later the road may be extended on from Falls City to Tuscaloosa. Dr. D. W. Day, Hartselle, is interested in the project, and is said to have secured the greater part of the money to finance it.

Permanent surveys have been made for the construction of an 18-mile line connecting Woodstock with Tuscaloosa, Ala. C. L. Fennell of the latter city is Engineer.

The Business Men's Club of Birmingham, Ala., has submitted a proposition to the business men of Selma offering to raise $100,000 toward the construction of a railroad up the old Cahaba valley from Selma to the Birmingham District providing the Selma business men succeed in raising $50,000 toward the project.

The Louisville & Nashville R. R. Co. has surveys under way for the proposed line of railway from Athens, Ala., to Nashville. Arrangements for the construction work have not yet been made. J. Werness, Louisville, Ky., is Assistant Engineer.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Fort Smith, Subiaco & Eastern R. R., which has 6 miles of line in operation from Paris to Subiaco, and is completing an extension from the latter place to Scranton, has been granted a charter for an extension of 23 miles from Scranton eastward to Dardanelle. An amendment has also been filed to the articles of incorporation of the company increasing its capital stock from $150,000 to $500,000. Henry Stroup, Paris, Ark., is General Manager.

Track laying on the extension of the Warren & Ouachita Valley R. R., from Banks to Hilo, a distance of 15 miles, is progressing rapidly. K. G. Morley has charge of the work.

John Scott & Sons, St. Louis, Mo., have started grading near Stuttgart on their contract for the extension of the Arkansas Central & Eastern R. R., from McGregor to Stuttgart, 18 miles. The building of the road will be superintended by A. M. Van Auken, Constructing Engineer.

The City Council of Jonesboro, Ark., on June 6 took up the matter of granting a franchise for a street car system for that city.

The stockholders of the proposed interurban line from Bentonville to Rogers have approved the survey of the promoter, J. D. Houseman, of St. Louis, Mo., and it is said that construction work will be started this month.

The Memphis, Dallas & Gulf R. R., which projects a line from Memphis, Tenn., to Dallas, Tex., and has construction work under way on one section of the line near Nashville, Ark., has purchased the Ultima Thule, Arkadelphia & Gulf R. R. and the Antoine Valley R. R., both Arkansas lines. The first named is a short strip of road which connects with the Iron Mountain road at Dalesville, Ark., and runs to Sparkman. The Antoine Valley line runs from Sparkman to Allenhurst.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

F. E. Trask of Los Angeles has been appointed chief engineer of the Arrowhead Reservoir & Power Co. and will for the present, at least, have charge of the work of the company as to the construction of the Little Bear valley dam and any other work under way.

Contracts for irrigation canal work near Willows have been let to the following: R. F. Ball of Fresno, for work to extend from the Jacinto Road, about four miles north of Willows, to the railroad track at Willows. This work will be in enlarging the old canal to carry a greater depth of water, and in constructing the immediate laterals to the canal. Just south of this contract, C. Harlinger of Willows has the contract for a section of the canal covering a distance of two miles. South of him is C. Scott of Willows, who will continue the work for a distance of two more miles.

The Oro Construction Co. has been incorporated at Oroville and will engage in general contracting business. The company has several large contracts in sight. The incorporators are H. P. Badgley, O. R. Adolfsen, A. B. Larsen and H. G. Lodge.

The Southern Pacific Ry. Co. is reported to be securing right of way for a new line into Southern California by way of Owens River Valley. The new line, it is said, is to be along the aqueduct route, which is presumed to have been built for the express purpose of connecting at Keeler with the Carson & Colorado, thence joining the main line of the Southern Pacific at Reno. But in addition to making this connection, the main line will push on across the Owens River Valley into Lida Valley, tapping a rich stock and mining region; thence almost due east to Goldfield and on to Austin, Nev., where connection will be made with the Nevada Central, a Southern Pacific property, which would be the link connecting with the main line of the Union Pacific at Battle Mountain.

Business men of Novato, San Rafael, San Anselmo, Kentfield, Larkspur and Corte Madera are raising $125,000 to begin the construction of a railway from Corte Madera through Ross Valley towns to Novato. W. L. Courtright, San Rafael, is interested.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Kaw Valley Construction Co., of Lamar, has been incorporated with a capital stock of $250,000, the incorporators being H. C. Byrnes, William Pasho and H. Stivers.

The Valley Ditch Co. has established offices at Las Animas and is preparing to begin work on a project on Smith canon, twelve miles south of Las Animas. This proposition will cover 28,000 acres and will cost $1,500,000 when completed. The district is formed under the Carey act. A large dam and canal will be built and it will take two years to finish the work.

The San Luis Valley R. R. & Power Co. has applied to the City Council of Pueblo for a franchise to operate gasoline motor cars over certain streets of the city. The new road will connect the city with a park, two miles from the city limits.

Advices from Greeley state that the Water Supply & Storage Co., owning Chambers Lake, will rebuild the dam in the Upper Pondre with concrete. The lake is a natural reservoir and supplies water for the ditch which runs into Weld county as far as Ault and Pierce. The dam, which is now of earth and wood, was constructed many years ago with the Sky Line ditch, which runs into lake.

Plans are under way at Greeley for the organization of a development company to take over the power privileges at Chamber's lake, the Stove Prairie reservoir and the power available from the Laramie River, and to form a power line to carry electricity from the mountains to northern Colorado for the operation of railroads, electric light plants and factories.

It is proposed to build a reservoir with a capacity of between 10,000,000 and 12,000,000 cu. ft. to irrigate the northern part of Weld county and the southern part of Kimball county, Neb. The site of the reservoir will be in Kimball county and the project will be completed within ten months. J. Hall Ubanks, Denver, is interested.

According to reports from the vicinity of Placervile, Colo., enginers are making good progress locating the Denver & Rio Grande line from the above city to Paradox Valley.

The Consolidated Construction Co., recently organized to absorb the Boston-Colorado Power company and the Park Irrigation & Water Co., has decided to construct the proposed Gilpin & Clear Creek District R. R. into the Gilpin and Clear Creek Mining districts. The road, it is said, will be broad gaged throughout from Pocatello, on the Moffat road, to Black Hawk, and on to the new extensions.

At a recent meeting of the City Council of Pueblo, Colo., the ordinance to grant the Kansas Colorado R. R. Co. an extension of franchise to construct a line to Turkey Creek stone quarries was defeated. It is said that about $150,000 of Pueblo capital is tied up in the project.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Business men of Carrollton have raised $25,000 and will secure an additional sum of $25,000 for building a railroad from this city to some point on the Southern Ry. or Seaboard Air Line. A charter for the road has already been secured.

The Georgia Power Co. has purchased the Etowah Power Co. and it is understod that it will be combined with the other extensive holdings of the Georgia Power Co. on the Tulula, Chestet, Chattahoochee and Etowah rivers. The Georgia Power Co. has already secured permission from the railroad commission of Georgia to issue $6,000,000 of stock and $6,000,000 of bonds with which to pay for, develop and extend its various properties. The company has also applied to the mayor and City Council for a franchise to do business in Atlanta. S. Fahs Smith, York, Pa., is interested.

The Brinson Railway Co. of Savannah, Ga., capitalized at $1,500,000, has been granted a charter to take over the holdings of the Savannah Valley Railroad and projects a system from Savannah to Athens, Ga., through the counties of Chatham, Effingham, Screven, Vurke, Richmond, Jefferson, McDuffie, Warren, Wilkes, Oglethorpe and Clarke. As proposed the route will pass through Springfield, Sylvania, Waynesboro, and Louisville, north through Thomson to Washington and thence to Athens by way of Lexington. The incorporators are George M. Brinson, Y. E. Bageron, W. C. Myers and John E. Foy of Savannah; James Imbrie of New York, J. T. Walker, E. T. Comer and W. J. Walker of Screven county, Robert M. Hitch and R. L. Denmark of Savannah.

The City Council of Columbus has voted to have the Columbus R. R. Co. extend its traction lines to Riverdale cemetery.

About 12 miles of line on the Moultrie & Western Ry., now in course of construction, have been completed and placed in operation to Hartsfield. From Hartsfield the road will be built to Sale City, in Mitchell county,

where it will cross the Flint River & Northeastern Railway. J. N. Pidcock, Whitehouse, N. J., is interested in the road.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

Farmers of New Boston Township and Millersburg Township have petitioned the Commissioners of Mercer County at Aledo for the formation of a drainage district.

The Wabash R. R. has announced that its yards at Edwardsville are to be enlarged.

The Joliet & Southern Traction Co., H. A. Fisher, President, Joliet, has been granted a 50-year franchise by the City Council of Aurora to enter that city and the company is considering the construction of new tracks.

Stock company of Elgin, Ill., is to be formed to construct the belt line around that city at a cost of $250,000 for which plans are now underway. As proposed the new line will encircle Elgin, crossing the Illinois Central at Coleman, then the Elgin, Joliet & Eastern Chicago, Milwaukee & St. Paul and the Chicago & Northwestern.

Chicago, Milwaukee & St. Paul R. R. is purchasing a large tract of land at Franklin Park, Ill., preparatory to the establishment of extensive freight yards. The work, it is said, will involve an expenditure of $440,000.

Advices from Decatur state that the Decatur, Sullivan & Mattoon Interurban Co. has closed a deal with the Central West Development Co. of Missouri by which the latter concern undertakes to finance and construct a trolley line between Decatur and Mattoon. The plans involve the placing locally of about $200,000 in bonds, the company taking the remainder of the stock and selling it. The Central West Development Co. now has a 100-mile line under construction out of Mexico, Mo.

The Chicago, Wheaton & Western R. R. has secured a majority of the frontage along the Aurora, Elgin & Chicago R. R., to gain an entrance into St. Charles for a Chicago car service via Geneva.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

Advices from Gary, Ind., state that the old Lake Shore tracks south of the present Baltimore & Ohio elevated right-of-way at Gary are to be extended by the U. S. Steel Corporation westward, crossing the Calumet River and past the sites of the American Car & Foundry Company and the American Bridge Company to the Baltimore & Ohio interchange yards at Clerk.

Advices from Owensville state that the Wabash levee to be built for Gibson and two other counties will be 40 ft. at the base, 6 ft. at the top and 9 ft. high. It will cost about $240,000.

The Pennsylvania R. R. has purchased two acres of land back of the Panhandle shops in Logansport and will build yards in that vicinity.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Commercial Club, of Missouri Valley, Ia., is advocating the construction of an interurban line to pass through Missouri Valley, Calhoun, Magnolia and Beebeetown.

The Commercial Club of Iowa City has begun a canvass of the city, to secure $100,000 with which to purchase stock in the proposed Iowa City-Ottumwa Interurban Ry. Co. It is believed that Ottumwa will duplicate this, and thus insure the building of the line.

The following drain contracts are to be let in the vicinity of Mason: On June 24, at the home of J. C. Hunt, seven miles southeast of Mason, in Ingham township, the county drain commissioner will receive bids for the cleaning out of Bashford drain; 70 ft. of 15-in. sewer pipe will be required, beside bids for some teaming. On June 16 at the home of Perry Aseltine in Wheatfield the contract for the mutual drain will be let. The main drain is 67.5 chains in length with a fall of 17.95 ft. and an average depth of 4½ ft. This has two branches, the first 5.61 chains long, the second 29½ chains long. The total length is one mile 90.44 rods. The main drain will be open, the branches of No. 1, 6-in. hard tile drain. One concrete retaining wall will be necessary, and three catch basins. The drain will be let in sections.

The Forest City, Fertile & Mason City R. R. Co., with headquarters at Watertown, S. Dak., and the privilege of a business office at Forest City, Iowa, has been incorporated under the laws of South Dakota. The company is capitalized at $400,000, and proposes the construction of a line of road 30 miles long in the counties of Winnebago, Hancock, Worth and Cerro Gordo, Iowa. The line is to start at Forest City, Iowa, running in an easterly direction to Fertile, and from there in a southeasterly direction to Mason City. The incorporators of the company are: P. O. Koto, C. N. Christopherson, C. S. Isaacs, Forest City, Ia.; A. M. Sheimo, Baldwin, Wis.; A. L. Sherin, M. J. Hawley, Watertown, S. Dak.

The General Construction Co., has its outfit on the ground for performing its filling contract at the location of the new Bettendorf Shops at Bettendorf, Ia. The work includes about 18,000 cu. yds. of fill. George H. Boynton is president of the construction company.

It is believed that the Illinois Central R. R. will shortly issue orders for the laying of a double track between Sioux City and Hinton.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A project is under consideration for the construction of an interurban line with the following proposed route: Hutchinson, Haven, Mt. Hope, Andale, Goddard, Viola, Conway Springs, Anson, Wellington, Geuda Springs and Arkansas City; a spur between Wichita and Goddard and a line running from Conway Springs to Anthony, running through Milan, Argonia, Danville and Harper. J. M. Frantz, Conway Springs, Kan., is interested.

The Oklahoma & Kansas Electric Ry. Co., of Baxter Springs, has been chartered with a capital stock of $1,000,000, and proposes to build a line from Galena, Kan. to Miami, Okla., and branches and connecting lines from Columbus to connect with the interurban Southwest Missouri and Southeast Kansas from Joplin. The incorporators are: Charles M. Jones, Charles L. Smith, E. B. Morgan, M. C. Harper, T. F. Cole, J. J. Fribley, John M. Cooper, L. M. Perkins, E. W. Dow, all of Baxter Springs, Kan.; William Houk and H. C. Compton of Joplin, Mo.; J. Shoman of Galena, Kan., and W. L. McWilliams of Miami, Okla. W. K. Palmer, Kansas City, is Chief Engineer, as noted in our last issue.

It is stated that improvements to cost $200,000 will be made immediately to the electric railway system at Atchison. This system was recently purchased by W. B. McKinley, Champaign, Ill., as mentioned in our last issue.

According to a statement of E. S. Alnutt, of Belleville, President of the Motor Grand Traction Co., which project a north and south interurban railroad from Chester, Neb., to Wichita, Kan., the work of construction will be commenced immediately beginning at Canton and proceeding north to Salina, and as soon as this is well under way, construction work will then be taken up at Belleville and pushed south to Salina.

The Kansas & Southeastern R. R. Co. has been granted a charter with a capital stock of $100,000 and headquarters at Pratt, Kan., to construct a line from Kinsley to Pratt through Edwards, Stafford and Pratt Counties.

Kentucky Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

It is undecided yet as to the route of the proposed extension of the Brooksville & Wellsburg Ry.; one line being proposed from Mt. Olivet, Ky., to Brooksville and probably to Flemingsburg, via Bee Lick and Johnson Creek Valley.

Engineers said to be working under orders of the Ferguson Contracting Co., New York City, have completed surveys of a railroad on Middle Fork, Beech Fork and Greasy, and are now surveying a road up Cutshin. It is reported in Kentucky they intend to build a road up one of these forks in Leslie county, and are ascertaining which one has the best grade.

Committee of Hickman, Ky., in charge of raising the required $20,000 and right-of-way to insure the construction of the Chicago, Memphis & Gulf R. R. from Tiptonville, Tenn., toward Hickman, has announced that the new road is now a certainty, as most of the money has already been subscribed.

The construction of a hydro-electric development on the Dix River, north of Harrodsburg is proposed by Eastern capitalists. About 12,000 H. P. may be developed with an expenditure of about $1,250,000. It is planned to furnish the electricity to a number of Central Kentucky towns.

Louisiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The company which proposes to build an electric railway from New Orleans to Algiers, La., is reported to have been financed to the extent of $1,500,000 by New York capitalists. H. C. Warmoth, New Orleans, La., is interested.

Reynolds, Watson & Co., 217 LaSalle St., Chicago, Ill., have purchased 34,000 acres of land near New Orleans, and will drain it and convert it into farms. This is part of a comprehensive scheme of Chicago capitalists for the reclamation of Trembling prairie swamp lands located 20 miles of New Orleans. F. W. Hodson, former secretary of agriculture and commissioner of stock of Canada, who recently resigned as land agent of the Union Pacific, is in charge of the project.

Work is under way on the reclamation of an 11,000-acre tract of land at Grand Cheniere for Belgium capitalists. It is expected that the tract will be colonized by the first of the year. Chas. D. Babbit, Gueydan, La., is the engineer in charge of the work.

D. K. Jeffries & Co., of Chicago, Ill., who have extensive timber interests in Concordia Parish, La., are planning the construction of a 5-mile railroad which will ultimately extend to Alexandria, La., to connect with Natchez.

Frank Jones, of Oak Grove, La., owner of some 8,000 acres of timber land in and near Oak Grove, is planning to build a standard gage railroad from Terry's Switch, on the E. & G. branch of the Iron Mountain, to run in a westerly direction to within one mile of Boeuff River, a distance of six miles. Fifty-six-pound steel has been procured, which is to be furnished by Aug. 1. Surveying on this line will begin at once. Mr. James intends to connect with Phin Kimball, a large capitalist, who is building a line from LaArk to within one mile of Boueff River, coming east, which will be completed this fall. E. J. Hamley, of Lake Providence, has recently purchased 8,000 acres of land about two miles east of Oak Grove, in East Carroll, where he will put a big sawmill. He expects to build a road from the mill to Lake Providence, and eventually connect with Janesline.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Grand Trunk Ry. has completed plans for a $50,000 freight house to be erected at Durand this summer.

The Detroit United Ry. Co., Detroit, has accepted various resolutions adopted by the city council giving the company permission to construct and operate at the will of the people a line out Hamilton boulevard, a loop on Grandy Ave., in conjunction with Chene St., and a double track on Mack Ave., where it is now a switch line. The company has placed its orders for the necessary materials and as soon as they can be assembled will begin the work of constructing the lines.

Advices from Lansing quote J. W. Ewing and J. S. Mudge promoters, as stating that the construction of an electric line from Lansing to Grand Lodge which was started nearly five years ago but discontinued after

several miles of track had been graded is soon to be resumed.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Plans for the depression of the H. & D. division of the Chicago, Milwaukee & St. Paul through Minneapolis, Minn., are now in the hands of the City Council waiting their decision.

The Duluth, Missabe & Northern Ry. is using all possible dispatch in pushing the reconstruction of its line between Hibbing and Mitchell a change made necessary by the Buffalo & Susquehanna strippings, which will cut the present yards of the line. The new construction is, however, temporary as the trains will soon pass over the new line now under construction to connect with the Coleraine Branch.

The Twin City Rapid Transit Co., W. J. Hield, General Manager, Minneapolis, is said to be working out plans for the construction some time this year, of a line of track on Maryland Street, St. Paul, from Lake Como to Hazel Ave., thus with a small connecting link around the south end of Lake Como, giving direct and rapid transit from Stillwater, Wildwood and suburban St. Paul to Minneapolis. The prospective construction of this line is said to be part of the extensive improvements of the street car company, involving an outlay of more than $1,000,000.

Duluth and the Ranges.

BY PETER E. MEAGHER.

F. R. Jones of Jones Brothers, General Contractors, was a caller at this office recently. They have a mine stripping contract here in Minnesota, and he said they were getting along very nicely on the same. Their other contracts in Iowa and Ohio are in good condition.

George Slater, representing the Illinois Steel Co., was a caller here recently, looking after business in his line.

A new constructing firm has come into this section of the country. That is, it is a very old firm, but has taken in some new members. The name of the firm is Dale & Bumgardner Co., and it is composed of Mr. Dale and Mr. Bumgardner, who have been in the contracting business for the past 25 years, and their general superintendents, F. C. Peabody and J. H. McMenney. They are working at the present time on the Soo Line, and have also been awarded a contract recently by the Northern Pacific Ry. Co. for some steam shovel work at Staples, Minn. We wish to congratulate the new members of this firm on being taken into partnership with such reliable contractors as Dale & Bumgardner, and they have our good wishes for a very successful business career.

Pastoret & Lawrence, general contractors, were callers at this office a few days ago. They have started on three or four jobs in Duluth, and have also started their big sewer job at Rice Lake, Wis. They were recently awarded some small sewer contracts by the city of Duluth.

Long & Erickson, Railroad Contractors, were callers at this office recently. They are engaged on several railroad contracts at the present time, and are also figuring on some new work.

Contractors Johnson and Curtiss, of the contracting firm of Johnson, Rodgers & Curtiss, were visitors at this office a few days ago. At the present time they have some railroad work on the Soo Line in Minnesota, and report that the same was getting along very nicely.

The last week or ten days, Duluth has been a point of attraction for a large number of contracting firms. The reason for the same was that the Canadian Northern Railway Company has called for bids for the extension of their railroad from Virginia, Minn., to Duluth, Minn., a distance of 86 miles. This is a very nice contract, and the work consists of about 300,000 yds. of rock, two or three steam shovel jobs, one tunnel, 600 ft. long, and a great deal of grader, wheeler and station work. It will be announced in about ten days who the successful bidder on this work is. Work is to be started immediately, and there will be a lot of work for sub-contractors. Any sub-contractors in the market for work, if they will send this office their names and the size of outfits they have, we believe that we will be able to place them. This work will take about 1½ years to finish.

P. McDonnell, the Duluth contractor, was awarded a $100,000 paving job by the city of Duluth last week, and is to start on the same immediately. He was also awarded a $68,000 paving job at Iron Mountain, Mich., and a $28,000 paving job by the city of Virginia, Minn. These two contracts are also to be started at once.

Captain Roberts of Roberts-Kingston Contracting Co., which has some stripping contracts in the iron country here, was a caller at this office a few days ago.

Greer Thompson, General Superintendent for the Drake & Stration Co., was a caller in this city last week, and reported that they were very busy on their stripping contracts on the Iron Range.

Charles Jacobson, Railroad Contractor on the Soo Line, was a caller recently. He said his work was getting along in very nice shape, and that he was figuring on some new work, which he was successful in getting, he would have to start immediately.

C. J. Frederickson, concrete and bridge contractor, was awarded several very nice contracts by the Great Northern Ry. on their system between Duluth and Spokane, Wash., and has already started on the work.

H. L. Bartlett Co. were awarded last week a $60,000 paving contract by the city of Virginia, Minn., and will start on the same immediately.

C. J. A. Morris came up to look over his dock contracts in this city.

The labor situation in this vicinity at the present time is in a very satisfactory condition as far as the labor agencies and the contractors are concerned. The class of laborers here at the present time is very good and there is enough to fill all positions offered. There is quite a bit of work in sight, and taken all together the coming season looks very prosperous for the laboring man.

J. D. O'Connell, Contractor, who was awarded a $60,000 paving contract by the city of Two Harbors, was a caller here last week. He said that he had already started on this work, and intended to rush it as fast as possible.

Contractors and others when in this vicinity are invited to make the labor and equipment offices of Peter E. Meagher, 409 West Michigan St., Duluth, Minn., their headquarters while here.

Mississippi Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Illinois Central R. R. has purchased 100 acres of land in the northern part of McComb City, Miss., in the basin of a stream as a site for large reservoirs. Material from excavation will be used to build a dam. Concrete spillways will be constructed to guard against floods. A pumping plant will be installed, with pipe lines to distribute water to the machine shops, roundhouse and other steam-using plants.

The Sumter & Northwestern R. R. Co., has been incorporated under the laws of Mississippi, and will probably build a short line from Sumter, Ala. to Meridian. The incorporators are: John Alexander, Aurora, Ill.; George C. Hixon, Chicago; J. M. Hixon, La Crosse, Wis.; T. E. Brittingham, Madison, Wis., and F. J. Hughes, Sumter, Ala.

The Batesville & Southwestern Ry. Co., recently chartered , proposes the construction of a line from Batesville to Charleston, in Tallahatchie county, where connection will be made with the road already running into Charleston. The road is said to have been financed and prospects are good that construction work will be started shortly. Judge Edward Mays, T. Lama Ross, Lucius Mays, all of Jackson, and J. C. Longstreet of Grenada, were the incorporators.

The Board of Supervisors at Scranton, granted a franchise to W. D. Bullard and his assigns to build an electric railway over the new automobile road lately completed to the Alabama state line. A further franchise was granted him over the public road leading from the automobile road at Orange Grove to Moss Point, and over the telephone road from Moss Point to Pascagoula.

The Pascagoula & Northern R. R. plans to have its first train in operation on its new line between Scranton and Evanston, 35 miles, on June 4. The present plan of the company is to eventually extend the road to Memphis. The Pascagoula Northern was first built by W. Denny & Co. to transport timber in the northern portion of the country, and was later made a standard-gage road.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

An ordinance is before the City Council of Kansas City granting the Metropolitan Street Ry. Co. a franchise for a cross town line along Chestnut Ave. The ordinance provides that the construction of the line begin at 15th St. and Chestnut Ave. and extend north along Chestnut to Lexington Ave. This part must be completed and in operation in eight months. Construction of the remainder of the line, between Lexington and Guinotte Aves., is to begin within six months after the grading of a traffic way through North Terrace Park has been completed by the park board.

Swift & Rust have been awarded a contract by the Wabash R. R. for constructing 250 ft. of dike at the Baker-Ducan bend in the Missouri River near De Witt. The work will require 1,500 cu. yds. of stone and 700 cords of brush.

The Board of Public Improvements of St. Louis, Mo., will probably recommend that the Municipal Assembly appropriate $100,000 for the construction of a revetment to protect the land owned along the river by the city and to protect the city's water supply carried by the conduits.

Excellent progress is being made by the promoters of the proposed railroad from Joplin, Mo., to the Southwest, touching Shawnee, Okla. The starting point of the road is Joplin, the great mining district of the middle west. It will proceed southwest to Tulsa, thence to Sapulpa and Shawnee and on through Norman and Chickasha. Already 40,000 ties have been ordered to be used between Tulsa and Joplin and the grade is completed. At the completion of this gap in the line both Tulsa and Joplin will give a bonus of $25,000 each. William Demland and Daniel Kennedy, Shawnee, Okla., are interested.

Surveys are stated to have been made, some of the right-of-way secured, and plans for construction are well under way for the projected line from Kansas City to St. Louis, which is to be built by W. B. McKinley, head of the Illinois Traction system. In connection with this project Mr. McKinley has recently purchased the electric railway systems at Atchison and Topeka, Kans.

The J. H. Flick Construction Co., 84 Van Buren St., Chicago, Ill., has been awarded the contract for constructing the interurban line from St. Joseph to Savannah, Mo.

St. Louis Items.

BY A. B. KOENIG.

The L. J. Smith Construction Co. expect to finish ballasting the Missouri Pacific R. R. in Colorado this week and as soon as through will move their outfit to ballast the Wichita Division of this same road.

L. A. Nutter, General Superintendent of the L. J. Smith Construction Co., stopped off a day here on his way to Kansas City from Wynne, Ark.

Minor Meriwether, well-known attorney and receiver of the city of Memphis during the reconstruction period died here last week at his home, 3716 Dolmar boulevard, at the age of 84. Mr. Meriwether's suggestion resulted in the Tennessee Legislature abolishing the charter of Memphis when it was unable to meet its obligation after the war.

Costello Bros. have their steam shovel and team outfit at work on the Big Four R. R. near

Oaklandon, Ind. The Costello boys are making rapid progress with all of their jobs on this line.

Chas. Nagel is getting ready to get out riprap for the Government north of the city.

The cost of sewer construction shows no signs of reducing. The bills proposed for the two sections of North Harlem Joint Sewer district not only were much higher than the estimate of the Board of Public Improvements, but were about $28,000 more than the city was offered a contract for the work six months ago. Two bids were received for the first section of North Harlem Joint Sewer district. John F. McMahon offered to do the work for $164,588.15 and the Fruin-Colnon Contracting Co. submitted a bid of $191,405. The estimated cost was $141,000. On the second section the Southern Construction Co. offered to do the work for $158,910.80; John F. McMahon bid $162,483.35 and Fruin-Colnon Contracting Co. bid $173,778.90. The estimate was $148,000. The cost of cement has increased so much that contractors have refused to bid on the work within the estimates of the board. The aggregate of the two low bids yesterday is $323,498.95, while the low bid for the work six months ago was $295,189.25.

The decrease in building operations in this city for May of this year, as compared with the corresponding month last year shows up favorably with any of the other large cities of the country. The percentage of decrease here was much smaller than in many of the other cities. The fact became known recently when the monthly reports of the building departments of forty-two cities were made public. The decrease here for May was 13 per cent. The total operations for the month were $1,581,717, against $1,823,926 for May, 1909. In Chicago the falling off was 40 per cent, and in New York 23 per cent. San Francisco showed the greatest loss of any of the large cities. It was 62 per cent. Philadelphia had a falling off of 9 per cent and Cleveland 31 per cent. The total building operations for the principal cities of the United States for May, 1910, were $61,804,336, against $75,494,067 for the corresponding month of 1909.

M. J. Roach of Memphis, Tenn., has moved his largest outfit from Gale, Ill., onto the big levee job at Rosedale, Miss.

Mr. Gifford of List & Gifford left here for the south to begin on their double track work on the Iron Mountain R. R. between Bald Knob, Ark., and Poplar Bluff, Mo.

C. H. Hilliard, 136 Hardin Ave., Jacksonville, Ill., has 200,000 yds. of slip, wheeler and machine work on the Springfield & Jacksonville Interurban Line to sublet.

John Kuert & Co. have started their concrete work on the McCoupin County R. R. the other day.

The Ferguson Contracting Co., 318 Commerce Bldg., Kansas City, are advertising in the local dailies for a team outfit to do 40,000 yds. of grader and scraper work, either by contract or day.

A. B. Koenig is going to leave here Monday night to spend a week fishing at the Club house at Corning, Ark. Several of our local contractors who are expert fishermen and fly casters will be with Koenig. A liberal supply of bait has been shipped to Corning the past week and there is not much danger of this party suffering from this source.

Jas. Ward has his outfit at work at Madisonville, Ky.

E. Y. Sutherland, 2208 Salisbury St., St. Louis, has finished his pile driving and trestle work on the Iron Mountain R. R., between Chester and Thebes, Ill. He has two pile drivers idle and is in the market for this kind of work.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Auburn & Syracuse Electric R. R. Co., T. H. Mather, Chief Engineer, Syracuse, will, it is said, have work started soon on its cut-off between Skaneateles and Auburn.

The Schenectady Ry. Co., of Schenectady, has been granted permission by the State Public Service Commission to sell its right in the franchise to operate on Central Ave. from Watervliet Ave. to the western boundary line of Albany to the United Traction Co. of Albany. The commission has approved the agreement by the Schenectady company as agent of the United Traction to use the latter's tracks in Albany, Troy, Watervliet and Green Island. The commission also authorizes the Schenectady company to lease to the United Traction the franchise granted in Watervliet to operate on 19th St., 6th Ave. and 25th St.

The State Public Service Commission has authorized the Mohawk Gas Co. to operate in the town of Niskayuna.

The Cortland & Auburn R. R. Co. of Cortland, which proposes the construction of a railroad between Cortland and Auburn, has elected the following officers and directors: President, Benjamin L. Webb; vice president, N. A. Bundy; general manager, N. A. Bundy; treasurer, Elliott L. Stone; secretary, W. D. Tisdale. It is reported that construction work will be started this season.

The Pennsylvania R. R. is planning to have work started soon at Newark, N. J., on its Market St. terminal to be built in connection with other proposed improvements which are to furnish a high-speed line between Newark and New York, with terminals at Military Park. The Newark terminal will be just south of the site of the present Market St. station.

The Allied Industries Co., of Newark, N. J., has been incorporated with a capital stock of $550,000 and proposes to engage in a general contracting business, constructing railroads, bridges, etc. The incorporators are Wm. W. Wilson, Pearl River, Rockland County, N. Y., David T. Gately, 373 Sixth Ave., Brooklyn, N. Y., and Nathan G. Wells, Penn Yan, N. Y

The Frontier Electric Ry. Co., which proposes to build an electric railway from Buffalo to Niagara Falls, has applied to North Tonawanda for a franchise through that place. The line will be built on private right of way, and will follow the Erie R. R. from Tonawanda to Buffalo. The rest of the route will be over the right of way of the Buffalo Thousand Islands & Portland R. R. The franchise obtained by the promoters of the railroad years ago would be used by the new company. Right of way has been obtained in Tonawanda, and the company has bought most of the property in North Tonawanda that will be needed.

L. B. Cleveland, of Watertown, at present engaged in the construction of a retaining wall for the New York Central & Hudson River R. R. along River St., at Watertown, has been awarded the contract by this company to build the subways for the entrance of the trains to the new station at that city.

The Boston & Albany R. R., F. B. Freeman, Chief Engineer, Boston, Mass., on June 8, filed a petition with the Public Service Commission asking for authorization to issue $2,000,000 bonds. The proceeds of the bonds are to be used for the payment of work already done or under way and for improvements to be made this year. Among the items are: Grand Junction railroad, third tracking and additional main tracks, $168,000; East Cambridge developing delivery yard, $50,000; Chelsea, new freight house, $6,500; Worcester, elimination of grade crossing and new passenger station, $400,000; four-tracking layout, South Worcester, $215,000; signals and interlocking, $331,000; bridge renewals, $250,000; third-tracking and additional main tracks connecting third track between East Greenbush and Rensselaer, $125,000; passing tracks and sidings at West Brookfield, Westfield, Washington, Canaan, State Line and East Chatham, $49,000; engine facilities at Beacon Park, West Springfield, North Adams Junction, Hudson and North Adams, $43,200; enlarging team delivery yard at Natick, $5,000; team and coach yard at South Framingham, $35,000; 60-car yard at Westfield, $10,000; widening track centers and additional two-track tunnel for eastbound main tracks at State Line, $150,000; and buildings at West Springfield, Becket and Westboro, $34,000.

The Brooklyn & Jamaica Bay Railway Co., has filed articles of incorporation with the Secretary of State at Albany. The company which has a capital stock of $100,000 plans the construction and operation of a railroad, a surface road from the intersection of Montauk and Liberty Aves. in Brooklyn, to a point at the mouth of Spring or Mill Creek, where it empties into Jamaica Bay, in Queens County and also to a point on Jamaica Bay in Brooklyn, where Montauk Ave. would end if extended. The directors of the company are as follows: Horace J. Subers of Ashbourne, Pa.; Nelson S. Easton, Daniel Von Wien, Edward S. Churchill, Marvin D. Hubbell and J. Douglass Wetmore of New York City and Frederick B. Langston, John Woodenbury and Richard F. Sears of Brooklyn.

A committee appointed by the State Legislature of Massachusetts to investigate the feasibility of constructing a railroad between Boston and Buffalo, N. Y., has reported such a project advantageous to the business world.

The New York & Hudson River R. R. is reported to have tentative plans under way for the construction of a large roundhouse at Brighton, near Rochester, and the establishment of freight yards near it. The plan proposes the removal of the present East Rochester freight yard.

The International Surface Contact Co., of New York City, has been chartered under the laws of Delaware, with a capital stock of $1,500,000, and proposes to operate and maintain surface railways.

The Hoosick Falls R. R. Co., of Hoosick Falls, N. Y., has been incorporated with a capital stock of $100,000 and proposes the construction and operation of railway lines, etc. The incorporators include Charles L. Livingstone, 149 Broadway; John G. Parker, Grand Central Station; Edward C. Brown, Grand Central Station, all of New York, N. Y.

The Rochester Belt Line Ry. Co., of Rochester, N. Y., has filed articles of incorporation with a capital stock of $2,500,000, and proposes the construction of a freight belt line around the city. It will be about 15 miles in length and will make possible interchange of traffic among the various lines entering the city. The Board of Directors include the following: Henry C. Brewster, President of the Traders National Bank; V. M. Smith, President of the Rochester Trust and Safe Deposit Co., Rochester and Frank A. Dudley, Niagara Falls, N. Y.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Pennsylvania R. R. has submitted its proposition to the City Council of Alliance for doing away with grade crossings over its line through the city.

The Carland Construction Co., Toledo, has been awarded the contract for constructing the new line of the Ohio Electric Ry. from Hamilton to Middletown. The old road will be followed from Hamilton to near Four Mile creek, then a fill will be made across the low land to Coke Otto. After the line is constructed through Coke Otto, the tracks will follow the C., H. & D. to Trenton. From Trenton there will be a cut to Elk Creek and then a fill east to Middletown. The line will be completed during the summer.

The City Council of Columbus has passed ordinances for the elimination of grade crossings at five points on the west side at Columbus touched by the tracks of the Baltimore & Ohio Southwestern R. R. The work will cost about $375,000.

The Columbus Railway & Light Co. has been granted a franchise to lay tracks and operate an extension of the Schiller St. line at Columbus from the present terminus at Parsons Ave. east in Schiller St. to Lockbourne Ave.

City Landscape Architect Rettig of Cleveland is preparing plans for an outer harbor at Gordons Park, Cleveland.

The Fifth Avenue Ry. & Light Co. has been organized at Columbus with a capital stock of $10,000 and proposes to build a line in 5th Ave., Columbus, from East Columbus to Grand View at Marble Cliff. It is estimated that such a line would cost $200,000. A. C. Wolfe, E. W. Yantes, J. E. Fippin, J. W.

Jennings and W. Cushing, all of Calumbus, are interested.

The Central Dredging Co., of Cleveland, has been incorporated with a capital stock of $100,000. E. M. Graves, the dredging contractor, of Cleveland, who was recently awarded a large contract on the New York State Barge Canal, is one of the incorporators.

The Western Ohio Railroad Co. has been incorporated with a capital stock of $10,000 and headquarters at Lima, O., and proposes the construction and operation of railroads. The incorporators are Frank H. Ginn, Albert E. Green, G. M. Cummings, Grover Higgins and John M. Garfield.

W. C. Phelps, Cleveland, has been in Sandusky, to look over the matter of building an electric line to Cedar Point from some point near Rye Beach, where it would connect with the Lake Shore Electric. Mr. Phelps has a franchise for such a line.

A promoting organization has been formed at Akron with C. Keith as President and Arthur Wright, secretary, for doing the preliminary work for a new electric line between Alliance and Akron. About $5,000 of stock subscriptions have been secured and this sum will be used for preliminary work.

Plans have been completed by D. H. Burnham & Co., Architects, Chicago, Ill., for the new terminal station to be erected at Third and Rich Sts., at Columbus, for the Ohio Electric railway. The building proposed is to be two stories high but built to carry many more. It is to cost not less than $175,000. The site has already been cleared.

Fred Bimel, of Portland, vice-president of the Cincinnati, Bluffton & Chicago railway; John C. Curtis, of Huntington, general manager of the C., B. & Q.; Henry George, of Chicago, a director of the same road; John Romer, of St. Henry, and W. D. Hawkins, of Portland, are said to be back of a project to build a steam railway from Bellefontaine, O., to Portland, Ind., a distance of 60 miles.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Oklahoma Union Traction Co., A. A. Small, President, Tulsa, Okla., is stated to have secured the necessary capital for the completion of its lines, and will, it is said, have work started shortly on an interurban line between Tulsa and Sapulpa. This line will require the construction of a bridge over the Arkansas.

The promoters of the Kansas City, Tulsa & Southwestern, which projects a line from Kansas City to Paris, Tex., have decided to build a line from Joplin to Tulsa. It is reported that the line has been financed and that grading work will soon be started over a route already surveyed. The principal officers of the Kansas City, Tulsa & Southwestern are Tulsa men. Col. C. B. Lynch is president of the company.

The Hines Chicago Construction Co. of Oklahoma City, has been granted a state charter. This company was organized for the purpose of constructing the International & Great Southern R. R., for which a charter was taken out in 1904, but nothing further has since been done. It is understood one line of the new road is to go northwest from Oklahoma City to Buffalo, in Harper County, and thence on to Trinidad, Colo. The Hines Company has a capital stock of $50,000, and the following directors: P. A. Hines and F. J. Karasek of Chicago, and Ed Glasgow of Oklahoma City.

The Chicago, Rock Island & Pacific Ry. has had surveyors in southwestern Oklahoma and the Texas Panhandle running a line for a contemplated extension of its Chickasha-Mangum line west from Mangum into the Texas Panhandle country. The rapid construction of the Wichita Falls & Northwestern R. R. north and northeast into what has heretofore been Rock Island is believed to have something to do with the activity of the Rock Island.

Advices from Wakita, Okla., are to the effect that the Atchison, Topeka & Santa Fe R. R., has decided to reconstruct the old Hutchinson & Southern (Hog) Railroad, as far as Ponca City or Blackwell. The work will include laying new ties and steel and resurfacing the roadbed. R. W. Reece, Wakita, Okla., will be in charge of the work.

Grading work has been started just north of Stillwater on the Morrison Division of the Oklahoma Public Service & Interurban lines. The section will be 13 miles long, and Dan Sweeney & Co., Oklahoma City, have the grading contract.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Oregon Valley Land Co., according to advices from Lakeview, Ore., has awarded the contract for constructing the Drews Valley reservoir dam to E. S. Burney at about $125,000. The dam when completed will be 65 ft. high with a base of 140 ft. and the top 12 ft. wide. It will be built of rock entirely, the lower part being faced with solid masonry while the upper part will be faced temporarily with lumber.

The Oregon Trunk Line Ry. has opened headquarters at Bend, for the construction of the 125 mile section, the contract for which was awarded a short time ago to H. C. Henry, of Seattle, Wash. J. J. Cryderman, Division Engineer of the Oregon Trunk Line is the representative of the railroad and Malcolm McPhee will be in charge for the contractor.

The City Council of Eugene has granted a franchise to J. F. Mounce to build a steam railroad over certain streets of the city to be used in connection with a steam line which he proposes to build from Eugene to the Coast. Surveys have been under way for some time.

The Oregon Trunk Line has placed an order with F. L. Botsford Lumber Co. of Portland, for 500,000 railroad ties to be used in construction of the line into central Oregon. The ties are to be distributed as required in the construction of the road towards Klamath Falls.

According to an announcement reported to have been made by President Francis H. Clarke, of the Coos Bay & Oregon Central R. R., construction work will be started on the line from Coos Bay to Boise, via Roseburg, Ore., before September 1. Surveys have already been completed and financial arrangements are being made with comparatively little trouble.

H. C. Henry, Seattle, Wash., who has the contract for constructing the 126 miles of Oregon Trunk Railway from Madras south to the north of the Klamath Indian Reservation has let the last sub-contract to Nelson Bros. With one exception, every contract is in lengths of from two to 12 miles. All the contractors, with the exception of Nelson, have their camp outfits on the ground and are ready to start work at once. The camps at present are not ready to take care of a great influx of labor, but have had no difficulty in getting filled to their present capacity.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Sub-contracts for work on the Western Maryland R. R. extension have been let by the Carter Construction Co., the general contractor, as follows: Beginning at Cumberland, Md., the eastern end of the connecting link: Mile 1 to 21, John B. Carter Co., Indianapolis, Ind.; mile 29 to 32, Head & Right, Chicago, Ill.; mile 33 to 35, Fisher & Caroza, Baltimore, Md.; mile 36 to 43, Conestoga Construction Co., Pittsburg, Pa.; mile 44 to 46, Ryan & Wannington, Springfield, Mass.; mile 47 to 50, Patton & Lapsley; mile 54 to 58, American Engineering Co., Indianapolis, Ind.; mile 62 to 67, Foley Bros., Pittsburg, Pa.; mile 69 to 71, Handon & McCourt Co., Akron, O.; mile part of 71 to 77, F. W. Stanley Construction Co., Conneaut, O.; mile 78 to 80, W. M. Bates, Memphis, Tenn.; mile 81 to 83, R. Galiardi, Connellsville, Pa.; mile 84 to 87, Robert Will Construction Co., New York city, N. Y. The Hagerstown Cement Co. has secured the contract to furnish 250,000 bbls. of cement.

The Johnstown Passenger Ry. Co., G. Nelson Smith, Chief Engineer, Johnstown, will soon have work started on the extension of its Southwest line. The supervisors of Upper Yoder township have granted the company permission to construct its trolley extension from the limits of the city in the Eighth ward to the new suburban residence town of Southmont, thus removing the last official barrier to the construction of the road.

The Sylvan Dell Park Ry. Co., has been incorporated with a capital stock of $24,000 and headquarters at Williamsport and proposes the construction of a 1½-mile line from South Williamsport to Sylvan Dell Park.

The Mt. Washington Incline Plane Co., of Pittsburg, Pa., recently chartered with a capital stock of $5,000, will take bids shortly for the construction of an incline plane from a point in Bailey Ave., 775 ft. east of William St. to a point in Carson St., where it intersects Brownsville Ave., Pittsburg. A. B. McGrew, F. B. Maloy, M. O'Herron, W. J. Munson and J. G. McCalmont of Pittsburg are interested.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Good progress has been made in the construction of the Galveston-Houston interurban line, the status of the work on June 1 being about as follows: The hydraulic fill on Galveston island, consisting of 120,000 cu. yds., for which the North American Dredges Co. was the contractor, has been completed, and the work of grading and track laying will be pushed on that portion during the summer. The causeway also is well under way. Concrete piling has been driven from the island end to a point where the first arch will be built, this being a considerable way toward the center. On the mainland end the piling has been driven to a point about midway between the first arch and the land. Piling for nineteen of the arch piers has been driven, leaving only five, including the two lift piles, to be completed. Upon several of these concrete has been poured, while a number have been brought above the waterline. On the mainland, J. C. Kelso of Galveston has completed about 21 per cent of the grading. This includes a large portion of the 16-mile strip between a point two miles this side of the causeway approach to Clear Creek. At Dickinson's bayou, piling for the bridge at that point is being driven. On the 19-mile extension between Clear Creek and Brays bayou, Harty & Ford began work about May 15.

The Houston Electric Co., David Daly, Manager, Houston, is to extend its Arkansas Pass line for 13,000 ft. in the Third Ward at Houston at a cost of about $60,000.

C. D. Alexander of Dallas and associates are reported to be negotiating for the purchase of the Bartlett-Florence Ry., a 24-mile line, with the view of extending it west from Bartlett to Marble Falls, Tex., and east from Florence to some point not as yet decided upon.

The Pecos & Toyah Lake Irrigation Co. of Pecos has been incorporated with a capital stock of $1,500,000, the incorporators being J. N. Levin, R. S. Johnson, T. H. Beauchamp, all of Reeves and Pecos counties.

A horseback survey has been made of the country between Temple and Marble Falls to obtain information as to the practicability of a line of railway to connect the two points named. In the event that the country is found to lend itself readily to construction that is of not too costly a character a project will be launched, having for its object a line connecting Temple and Del Rio via Marble Falls, Fredericksburg and Kerrville.

Bids were opened June 15 by O. Owen, Port Arthur, for building in Lake Sabine, opposite Port Arthur, Tex., in 4 ft. of water, an island 700 ft. by 700 ft., formed of concrete or wood revetment, dirt fill, approached by causeway 2,000 feet by 100 feet, wood revetment, dirt fill.

The Galveston, Harrisburg & San Antonio Ry. has applied to the State Railroad Commission for authority to issue $5,384,000 of bonds for the Galveston-Victoria division. This portion of the lines never has been bonded, comprising the old San Antonio and Gulf lines

and that new portion between Stockdale and Cuero. The bonds are being issued for general improvements over the lines and if granted will be issued on the valuation of the lines made at the time of their sale in 1904, plus the betterments. This old portion of the line extends from San Antonio to Stockdale, while the Gonzales branch is also an older portion that was purchased several years ago. The new portion, completed in 1906, extends from Cuero to Stockdale, a distance of 38 miles. There are other little branches and roads acquired in the general purchase several years ago.

Track laying out of Temple on the Temple Northwestern Ry., will be started about July 1. All grading work for the entire line between Temple and Hamilton will be ready for the steel by Sept. 10. W. J. McDaniel, Temple, is President. D. J. Grigsby, Dallas, is the Contractor.

Cane growers, whose property adjoins the Indiana co-operative canal at Brownsville are considering means of securing an extension of the St. Louis, Brownsville & Mexico Ry. into their irrigation area. In order to secure the extension the cane growers must furnish right-of-way through the city of Brownsville so that the St. Louis, Brownsville & Mexico Ry. would be enabled to make connection with the road connecting Brownsville and Point Isabel. From some point on this road they must give right-of-way to the terminus they select and must turn it over to the railroad company graded and ready for the ties.

C. S. Fowler & Bro., according to advices from San Antonio, have purchased the O'Connor ranch in LaSalle county, one of the largest ranches in Southwest Texas. The purchase price was about $500,000 and the land is to be used for colonization purposes.

The Crystal City & Gardendale R. R. Co. has filed its charter. The company has a capital stock of $45,000, and proposes to build a line to run from the junction of the International & Great Northern at Gardendale, LaSalle county, to crystal City, Zavalla county, the line to extend through LaSalle, Dimmitt and Zavalla counties, a total distance of 40 miles. The incorporators include Mason Williams, H. L. Howard, S. P. Brundage, Eli Howell, Adolph Groos, W. F. McCaleb, all of Bexar county and A. R. Ponder of Crystal City.

The Naples & Northwestern Ry. Co., has been chartered with a capital stock of $100,000 and proposes to build a line from Naples to Sylvester in Titus County, a distance of 85 miles. The incorporators include Max Krosse and F. T. Atkinson, Cincinnati; Frank Stacke, W. W. Southworth, J. R. Conley and Charles B. Todd, all of Naples.

Officials of the Velasco, Brazos & Northern R. R. (Houston & Brazos Valley) have been conferring with the State Railroad Commission with a view of registering bonds on a 4-mile extension of road from Velasco along the Brazos River to the lighthouse, and on additional values upon the entire line of 20 miles length due to improvements and betterments.

Citizens of Dimmitt have offered to give a bonus of $50,000 and right-of-way for the construction of the Hereford North & South R. R., to that place. Hereford has offered a bonus of $100,000 to the same road and it is now thought that the road will be built.

The Houston Electric Co., operating a street railway project at Houston, is to expend $16,000 in stringing an extra overhead copper wire in the business section of the city, to prevent electrolysis.

Capitalists of Fort Worth are considering a project for the construction of an interurban line from Corsicana via Fairfield to Crockett. W. J. Miller, Fairfield, is interested.

Agreements have been signed at Weatherford for the building of the Chicago, Weatherford & Brazos Valley from that city to Bridgeport. Weatherford gave $60,000 bonus, Peaster $7,000; Poolville, $15,000; Booneville $4,500; Bridgeport $12,000. The work of grading is to be started July 4.

Surveys have been started at Cotulla and are being run in both directions from that place for the proposed line of the Corpus Christi of Del Rio R. R. The survey will be completed about July 1. Arrangements have been made to take up as soon as the survey is finished the matter of bonuses and right of way. J. H. Collins, 88 LaSalle St., Chicago, Ill., is stated to be in charge of the surveys.

The Hughes-O'Rourke Construction Co., of Dallas, has been awarded the contract for the bridges for the St. Louis Southwestern extension from Gatesville to Comanche. This work consists of three bridges with 135-ft. spans across the Leon River, with several culverts and smaller bridges along the line. The concrete abutments of the three bridges range from 50 to 75 ft. in height, and are heavy work. This work is to be completed to Hamilton ready for operation of trains by Sept. 15. Thompson & Scott, St. Louis, Mo., general contractors for the extension line, started grading at Gatesville.

Good progress is being made on the construction of the proposed line of the Uvalde & Crystal City R. R. It is now complete from Crystal City, Ark., to Carizo Springs. From Gardendale west towards Crystal City about 18 miles has been graded and from Crystal City east towards Gardendale seven miles has been graded. The entire distance is 41 miles and the gap between the two graded sections is being rapidly closed up.

About three-fourths of the main line of the Santa Fe R. R. between Denver and Galveston, Tex., have been completed. The two links which will be built this year are between French and Clovis, N. Mex., and Clovis, on the cutoff to Coleman, Tex., a total distance of 250 miles.

Rumors from Quanah, Tex., are to the effect that the Chicago, Rock Island & Pacific Ry., has preliminary surveys under way for the construction of a line from Chattanooga, Okla., to Quanah, where a connection will be made with the Quanah, Acme & Pacific, now under construction to Roswell, N. Mex., and thereby get a shorter route to El Paso, Tex.

The construction forces of the Paris & Mount Pleasant Ry. Co., have completed 25 miles of grading on the proposed 55-mile line and R. W. Wortham, Paris, Tex., of the company is preparing to file an application for the issuance of bonds. As projected the route is from Paris to Mt. Pleasant, Texas.

Commercial Clubs of Dallas and Coleman, Tex., are taking active steps toward securing right of way and necessary bonus to insure the construction of the Santa Fe line from Cleburne to Coleman, the terminus.

Grade revision work on the Santa Fe between Temple and Coleman, was started early in June at Temple, with 200 men and a steam shovel. The work is being done under the supervision of J. P. Shortall of Chicago, superintendent of the C. H. Sharp Construction Co., which has the contract for the work.

The City Commissioners of Palestine are considering an application by private parties to grant them a franchise for the construction of an electric street car line. The proposition provides for early construction of the line, two miles to be completed the first year and two miles each succeeding year thereafter until eight miles have been completed.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Salt Lake & Ogden Ry., E. A. Vail, Chief Engineer, Salt Lake City, which was recently changed from a steam to an electric line, is to at once double track its entire line of 50 miles.

H. A. Strauss, C. E., President of the Falkenau Electric Co., Chicago, Ill., has been making an investigation as to the feasibility of constructing an interurban electric line between Salt Lake City and Payson. If the report is favorable a company will be organized to construct and operate the line. S. L. Chipman, American Forks, and A. J. Evans, are interested.

Division Superintendent A. F. Brewer, of the Oregon Short Line Ry., at Salt Lake City, Utah, is preparing for the construction of three spurs in Brigham City in order to add to the facilities for the increasing business at this city.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Announcement has been made at the Lynchburg, Va., office of the company that the Rockfish Valley Ry. will be built up the Rockfish river valley from a point on the Southern railway not far from North Gardens.

Northern capitalists have purchased land two miles north of Lynchburg and will develop it for building purposes. It is understood that the Lynchburg Traction & Light Co. will extend its line to the property.

The Graham Electric Ry. Co., of Graham, Va., has been incorporated with a capital stock of $50,000, the officers of the company being as follows: J. F. Dudley, President, William Mitchell, vice-president; R. B. Williamson, Secreatry and C. W. Keister, treasurer, all of Graham, Va.

West Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Burnsville, Glenville & Parkersburg Electric Ry. Co., of Parkersburg, W. Va., has been incorporated with a capital stock of $10,000 and proposes to build an electric line from Burnsville by way of Glenville to Parkersburg. The incorporators are: N. J. Bartlett, J. B. Supler, Clarksburg, W. Va.; L. W. Bartlett, C. E. Hines and Henry Sipes of Buchannan, W. Va.

Ramage, Wolfe & Co., Fairmont, W. Va., have been awarded the contract by the Clarksburg & Weston Traction Co., which projects a line from Clarksburg to Weston, for constructing seven miles of road between Clarksburg and Mount Clare. The contract amounts to about $85,000 and work has been started.

The City Council of Sistersville has granted a new franchise to the Parkersburg & Ohio Valley R. R. and it is said that the line will be completed at once to Friendly and later to Williamstown.

A committee from Hedgesville, of which A. C. Dunham was chairman, has been in conference with the officials of the Hagerstown Ry. Co., Hagerstown, Md., in an attempt to have the company extend its electric railway from Williamsport to Winchester, by way of Hedgesville.

The State Line & Southern Ry. Co., has been chartered in West Virginia to build a road from about 800 ft. west from the west river bank of the Monongahela River at the West Virginia-Pennsylvania line to a point near Rivesville in Marion County. The company is capitalized at $10,000. The incorporators are Samuel D. Brady, H. M. Schrader, R. E. Kerr, of Parkersburg; B. M. Laughead, of Morgantown; Charles Morris, of Fairmont. Mr. Brady is chief engineer and Mr. Morris right-of-way agent for the Buckanon & Northern.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The directors of the Oregon & Washington R. R., J. D. Farrell, General Manager, Seattle, Wash., have filed resolutions with the Secretary of State, announcing intention to construct a branch from near Winlock, 67 miles easterly to Sulphur Springs, all in Lewis county.

The Vancouver, Camas & Washougal Traction Co., has filed articles of incorporation with the secretary of state. The company is capitalized at $100,000 and has its headquarters at Vancouver, Wash. A charter for 50 years has been granted the company which proposes the construction and operation of a line from Vancouver to Washougal in the southern part of the state. H. C. Phillips, W. D. Smith and E. M. Rands, all of Vancouver, Wash., are the incorporators.

The Alaska Northern R. R., O. G. Labrea, President, Spokane, Wash., according to reports is shortly to let contracts for the construction of 170 miles of railroad running

from its present interior terminal into the Matanuska coal fields in Alaska and to a point on the Susitana River, in the direction of the Iditarod gold fields. The road will follow the old survey of the Alaska Northern to Mile 146. From that point, one branch will run out to the Matanuska coal fields, 38 miles, and the other branch will run toward the Iditarod.

According to a statement reported to have been made by George Donald, President of the Toppenish, Simcoe & Western R. R. the line will be pushed on from Toppenish to a point near Lyle on the Columbia River. About 20 miles of the road has already been constructed.

The Puget Sound and Baker River R. R. Co., a subsidiary concern of the English Logging Co., is planning the construction of its logging road from timber holdings in Skagit County to Deep Water and both LaConner and Anacortes, Wash., seek to be the terminal.

The Northern Pacific will shortly begin laying 90-lb. rails on its lines between Pasco and Walla Walla to enable faster operating time and use of heavier power equipment.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

All right of way has been secured for the projected interurban line from Janesville to Madison and it is planned to have construction work started in July and completed in December. This is the line being promoted by the Cincinnati Construction Co. and officers of the company together with J. J. Hartley of Philadelphia and E. M. Maxwell of Cincinnati, who are under contract to build the line, were in Janesville recently going over the route.

It is stated that an engineer employed by the State Railroad Commission to investigate street car conditions in Milwaukee has reported that additional franchises permitting the Milwaukee Electric Railway & Light Co. to build cross town lines at Milwaukee, crossing the Menominee River are needed.

The capacity of the switching yard at Milwaukee having been about reached, officials of the Chicago, Milwaukee & St. Paul Ry. are considering building a cutoff at or near Brookfield. By building a cutoff west of the city the Milwaukee road could divert through freight trains consigned to Chicago or Eastern points or coming from Chicago and consigned to Western points. The Milwaukee freight yards could be used almost exclusively for handling local business.

Stockholders of the Chicago, Racine & Milwaukee R. R., have decided to increase the capital stock of the company from $100,000 to $250,000.

The Board of Public Works, of Milwaukee, has awarded a contract to A. T. Bues, at 12½ cts per cu. yd., for dredging in the inner harbor for the city. About $25,000 worth of work will be done.

The McGavock Construction Co., of Beloit, Wis., has about 200 men at work on its contract for grading for the C. & N. extension from Milwaukee to Sparta, Wis. The company has the contract for the 6½-mile section between Jonesville and Oxford, near Portage, Wis.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Michael McCormick, of Sudbury, Ont., has started work on his contract for building the Canadian Pacific spur line into Byng Inlet. The spur line will be 1½ miles in length, starting from mile 64 on the Toronto-Sudbury branch. There are now about 50 men employed on the work and it is expected that the line will soon be completed. The railway company is also starting to erect a big coaling dock at Byng Inlet into which they will run a spur line.

J. S. Gregory, St. John, has been awarded the contract for dredging the Oromocto Shoals near Fredericton.

Grading work on the Canadian Northern line from Strathcona, Alta., to Camrose, which is the final connecting link on the colonization extension which will join Strathcona and Calgary next summer, will be started shortly and the grade built for 25 miles this fall.

It is reported at Montreal that the Canadian Northern Ry. will purchase St. James Methodist church on St. Catherine St. and build terminals on the site. To reach this part of the city it will be necessary for them to tunnel under the mountain.

As a preliminary for the improvement of the harbor at water front at Toronto, the Board of Control has passed a resolution that a committee consisting of the Board of Control and the Chairmen of the Works, Property, Parks, Fire and Light, Legislation and Island Committees be recommended to Council to go into the whole question of placing Toronto's water front and harbor under a commission.

The Canadian Northern Ry. will let contracts on June 15 for the construction of a 61-mile section between the south side of New Westminster railway bridge and Chilliwack. A start will be made opposite New Westminster, B. C., where the railway company has acquired an area of over 2,000 acres. Other sections of the road between Chilliwack and Yellowhead Pass will be placed under contract just as soon as the final surveys have been approved. T. Turnbull, Winnipeg, Man., is Assistant Chief Engineer.

The Canadian Pacific Ry. has purchased the Government House property at Toronto for $800,000, but will not take it over until 1912. The purchase is supposed to be a part of a big scheme of improvements at Toronto.

The Canadian Northern R. R. is stated to have opened bids for work on the construction of its line from Hawkesbury, Ont., to Montreal. The line will cross the river at Hawkesbury and run easterly through Carillon, St. Andrews and St. Eustache to Hochelaga and Montreal. Both the route and location maps have been approved by the Railway Commission.

The contract for district four of the Trent Valley Canal, to the south of Campbellford, has been awarded to Hanly, Quinlan & Robertson of Toronto and Montreal. The total amount of the contract is something over $1,000,000. The same contractors were awarded the contract for district six last month, involving an expenditure of $600,000.

Mexican Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The National Rys. of Mexico, James M. Reid, Chief Engineer, City of Mexico, according to reports, will soon resume construction of the short line to connect Tampico with the City of Mexico. At the time the Mexican Central Railroad passed into the hands of the government, two years ago, it was constructing the Tampico-City of Mexico line. It had about 50 miles graded and some track laid from a point on its line some 25 miles from Tampico. Construction ceased when the road became a part of the National Railways of Mexico. The survey for this line calls for a low-grade route, notwithstanding the fact that it must mount from sea-level to an altitude of nearly 8,000 ft.

An organization with the following officers has been formed at the City of Durango to secure the construction of a railroad to connect Durango and Gutierrez: Carlo Bracho, president; Fortino de la Barcena, vice president; Jaime Gurza, secretary; Ricardo G. Saravia, assistant secretary; Manuel de la Parra, treasurer.

The Candelaria Mining Co., operating silver mines at San Pedro, Chih., has been making surveys for a 3-mile spur from the Mexico Northwestern Ry. to the plant.

Dr. Coe, an engineer of City of Mexico, is now in the field to select the route for the projected railroad of the Vera Cruz, Tabasco & Campeche R. R. Two routes for the road have already been located. Both have Santa Lucrecia and Campeche as the terminal points. Both routes run from Santa Lucrecia to the town of Hato de Oro, and from Salto on the Tulija river to the city of Campeche. The only difference is between Hato de Oro and Salto.

The Gigante Mountain Tunnel & Ry. Co., is stated to have secured a concession for a railroad from Guadalajara to San Felipe, Mexico, and thence to some point on the Gulf of Mexico. The line will be about 600 miles long. John M. Wiley, New Orleans, La., is President.

Engineers of the Mayo River Power & Land Co., of Denver, Colo., which last year was granted a concession for power development on the Mayo River in Sonora have engineers in the field in Sinaloa collecting data with a view to possible future hydro-electric developments in that state. R. M. Jones, Denver, Colo., is engineer.

It is expected that Engineer Robert Gayol, City of Mexico, Consulting Engineer to the Federal Government in the project for the Canalization of the Rio Nazas, will shortly make a report on the scheme. Plans for the work were completed some time ago by S. Pearson & Son, City of Mexico.

Advices from Chihuahua, Mex., state that it is rumored that the Kansas City, Mexico & Orient R. R. Co., and the Mexico Northwestern Ry. Co. will combine on a line of railroad from Minaca, Chihuahua, to Topolobampa, thus making but one line through the Sierra Madre instead of two. Engineers of the companies are to go over the proposed route at once. W. W. Colpitts, Kansas City, Mo., is Chief Engineer of the Kansas City, Mexico & Orient.

BIDS ASKED

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

St. Jose, Cal.—Until 11 a. m., June 27, by J. G. McMillan, County Surveyor, for the construction of a reinforced concrete bridge on Almaden road over Guadaltipe Creek, about 3 miles south of San Jose.

San Luis Obispo, Cal.—Until 10 a. m., July 6, by Board of Supervisors, for the construction of a steel concrete highway bridge across Salina River at Rector Crossing on the Santa Margarita and Pose Road. H. H. Carpenter is clerk of the Board.

Bridegport, Conn.—Until 4 p. m., June 17, by M. A. Kenny, director of public works, for the construction of a reinforced concrete arch bridge, 77 ft. span, requiring about 2,500 cu. yds. of concrete, on Boston Ave., Bridgeport, Conn.

New Hampton, Ia.—Until 1 p. m., June 15, by F. N. Lentz, county auditor, for a 60 ft. steel highway bridge with concrete floor, at Alta Vista, Ia.

Jeffersonville, Ind.—Until 11 a. m., July 16, by Board of County Commissioners, for the construction of a bridge over Logan Creek. Peter Machand is Auditor of Clark County.

Lawrenceburg, Ind.—Until noon, July 5, by County Commissioners, for the construction of a bridge over Hogan Creek. W. S. Fagaly is Auditor of Dearborn County.

Holton, Kan.—Until noon, June 16, by Board of County Commissioners, for the construction of three county bridges. W. A. Douglas is chairman of the Board and J. W. Martin is county clerk.

Taylor Falls, Minn.—Until 1 p. m., June 24, by Board of Village Trustees and Council, for the construction of a steel arch bridge between the villages of St. Croix Falls, Wis., and Taylor Falls, Minn., over the St. Croix River.

St. Joseph, Mo.—Until June 28, by L. M. Stallard, highway engineer, for Contracts No. 149, 150, 151, 152, for concrete culverts; Contract Nos. 157 and 158, for bridge repairs.

Schuyler, Neb.—Until noon, June 27, by Board of County Commissioners, for furnishing necessary labor and material for the construction of a wagon bridge over the Platte River near this city. M. F. Shonka is County Clerk. Official advertisement of this work will be found elsewhere in this issue.

New York, N. Y.—Until noon, June 21, by Borough President of Richmond, for the furnishing of all the labor and material for the construction of subway ducts and appurtenances in Jay St. from Richmond Terrace to South St. and other streets, together with all work incidental thereto. The work includes the following: 10,750 lin. ft. of double subway duct, each of 3.65 ins. interior diameter, all complete; 67 junction boxes, complete; 40 hand holes, complete; 2 manholes, complete; 16 cu. yds. of concrete pavement foundation taken up and new concrete foundation laid in its place; 96 sq. yds. of iron slag block pavement taken up and relaid with cement grout joints and sand cushion; 720 sq. ft. of cement sidewalk removed and replaced with new cement sidewalk similar thereto; 20 cu. yds. of additional excavation.

Hamilton, O.—Until 10 a. m., June 25, by Board of County Commissioners, for the partial repair of the superstructure of the Woodsdale bridge over the Mississippi River. J. E Brate is county auditor.

Huron, O.—Until 10 a. m., July 9, by County Commissioners for the construction of a highway Rolling Lift Bridge over the Huron River at Huron, O. The work is estimated to cost $50,000. A. C. Schultz is county surveyor.

Sidney, O.—Until noon, June 18, by County Commissioners for the construction and material of a superstructure for one steel highway bridge, 63-ft. span and 16-ft. roadway, across Plum Creek, Franklin Township, near Deweese School. H. T. Ruese is county auditor.

Pittsburg, Pa.—Until noon, June 15, by R. J. Cunningham, County Controller, for the construction of the following reinforced concrete arch bridges: Bridge No. 1, Boggs Run, Moon Township; bridge No. 4, Lick Run, Bethel Township; bridge No. 2, Piney Fork, North Branch, Bethel Township; bridge No. 7, Sewickley Creek, Marshall Township.

Pittsburg, Pa.—At once by Department of Public Works for the construction of three river piers of the North Side Point Bridge crossing the Allegheny River. The work includes about 16,000 cu. yds. of stone and concrete masonry. N. S. Sprague is superintendent Bureau of Construction.

Aiken, S. C.—Until 11 a. m., June 17, by Jesse Green, for repairing Crofts Mill bridge across Saws Creek on Crofts Mill Road.

Sussex, Va.—Until noon, June 16, by county clerk, for the construction of three steel bridges in Sussex County.

Appleton, Wis.—Until 2:30 p. m., June 24, by Board of Public Works for increasing the width of the roadway on Lake St. draw bridge over the United States government canal.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Demopolis, Ala.—Until 3 p. m., July 18, by James Knox Taylor, supervising architect, Treasury Department, Washington, D. C., for the construction complete, including plumbing, gas piping, heating apparatus, electric conduits and wiring, of the United States Post Office at Demopolis, Ala.

Monterey, Cal.—Until 11 a. m., June 20, by Arthur Cranston, constructing quartermaster, for the material and labor necessary for the construction of concrete assembly hall and for electric wiring and plumbing and heating of same.

Washington Barracks, D. C.—Until 2 p. m., June 20, by constructing quartermaster, for the construction of an addition to the post guardhouse at Washington Barracks, D. C.

Washington, D. C.—Until 2 p. m., July 5, by Department of Interior, Office of Indian Affairs, Washington, D. C., for furnishing material and labor for the construction of a superintendent's cottage and two employes' cottages at Turtle Mountain Reservation, North Dakota.

Washington, D. C.—Until July 6, by Department of Interior, Office of Indian Affairs, for the necessary labor and material for installing a heating plant and making repairs to the dormitory at Sisseton School, South Dakota.

Atlanta, Ga.—Until noon, July 11, by Robert F. Maddox, Mayor, for the installation of new heating and ventilating plants in 9 of the brick public school buildings of Atlanta, Ga. Official advertisement of this work will be found elsewhere in this issue.

Fort Des Moines, Ia.—Until 3 p. m., June 20, by constructing quartermaster, for the supply and installation of pews and fixtures in Post Chapel.

Independence, Ia.—Until 2 p. m., June 23, by Board of Education, for the erection and completion of a high school building; also for steam fan, heating and ventilating and plumbing apparatus. Harry E. Netcott, Independence, Ia., is architect.

Sioux City, Ia.—Until 7:30 p. m., July 6, by Independent School District, T. C. Prescott, secretary, for the erection of a 4-room brick school building in the Lowell district of the Independent District of Sioux City, Ia.

Fort Howard, Me.—Until 10:30 a. m., July 5, by constructing quartermaster, for the construction, plumbing, steam and electric wiring of guard house and one quarters for four officers; for the construction, plumbing and wiring of fire station and extension to the ordnance repair shop.

Columbus, O.—Until 1 p. m., June 27, by Board of Trustees of Girls' Industrial Home, Columbus, O., for furnishing the labor and material for completing the heating and lighting plant, including steam engines, generators, additions to switchboard, changes in water supply, reinforced concrete coal storage pocket, steel water storage tank, steam heat and electric conduits, underground electric wiring, wiring lamps and fixtures in twelve buildings, reinforced concrete electric light poles, induced draft fan, economizer and other changes and additions to the steam heating and electric lighting for the Girls' Industrial Home at Hyatts, Ohio, located in Delaware County, Ohio.

Wagner, S. Dak.—Until 8 p. m., July 1, by Wagner Masonic Building Association, H. D. James, secretary, for construction of a Masonic Temple building in Wagner, S. Dak. A certified check for $700 must be filed with each bid.

Bremerton, Wash.—Until 11 a. m., July 12, by U. S. Marine Corps, Quartermaster's office, Washington, D. C., for the construction of a marine barracks and officers' quarters at the navy yard, Bremerton, Wash.

Calgary, Alta.—Until June 20, by Hodgson & Bates, Grain Exchanges, Calgary, Alta., for the erection and completion, excepting plumbing, heating, electric wiring or elevators, of a business block on 7th Ave. and 1st St., for Beveridge Bros., Judge Travis and G. J. Ryan.

Regina, Sask.—Until noon, June 18, by R. S. Knight, Inspector, Supply Officer, for the erection of an officer's quarters at R. N. W. M. P. Barracks, Regina. Story and Van Egmond, Regina, are architects.

Winnipeg, Man.—Until 5 p. m., June 22, by William Wallace Blair, 400 Nanton Bldg., Winnipeg, Man., architect, for the construction and completion of a hotel building at Riverside near Proctor, British Columbia or the Canadian Pacific Railway Co.

Ottawa, Ont.—Until noon, June 25, by Department of Indian Affairs, Ottawa, Ont., for the erection of a brick school house on concrete foundation for the Oneida Indian Reserve, Ont. J. D. McLean is Secretary of the department.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

East Hartford, Conn.—Until 8 p. m., June 16, by E. E. King, East Hartford Fire District, for the construction of about 4 miles of concrete, tar or flagstone walks.

Waukegan, Ill.—Until 8 p. m., June 16, by Board of Local Improvements, for the construction of roads as follows: Docket No. 357: The improvement of a portion of County St., from the north line of Franklin St., to the south line of Ridgeland Ave., by grading, curbing and paving. Docket No. 357: The improvement of a portion of County St., from the south line of Ridgeland Ave. to a point fifteen (15) ft. south of the north line of Ridgeland Ave., by grading, curbing and paving. Docket No. 358: The paving and otherwise improving that portion of McAlister Ave. situated between the north line of Tenth St. and the southerly line of Liberty St., produced, including certain portions of all intersecting streets between said points. Docket No. 362: The improvement of a portion of County St., from the north line of Water St. to the south line of Washington St., by grading, curbing and paving; all in the City of Waukegan, Lake County, Illinois. Fred W. Buck is President of the Board.

Albia, Ia.—Until 2 p. m., June 27 (readvertisement of bids), by city clerk, for the construction of paving in this city. Hall & Adams, Centerville, Ia., are engineers.

Fort Madison, Ia.—Until June 16, by city council for the construction of vitrified brick block pavement on a concrete foundation with pitch or asphalt filled joints. The work includes 16,000 sq. yds. L. G. Kiel is city clerk.

Brazil, Ind.—Until 7:30 p. m., June 21, by city clerk, for the construction of cement sidewalks on National Ave. Jacob Prevett is City Clerk.

Delphi, Ind.—Until noon, July 5, by County Commissioners for the improvement of highways in Deer Creek and Jackson townships. M. G. Haun is Auditor of Carroll county.

Indianapolis, Ind.—Until 10 a. m., June 20, by Board of Public Works, for the improvement of Sherman Drive St. to property line Michigan St. by grading and paving the roadway.

Kokomo, Ind.—Until 10 a. m., June 27, by Board of Public Works, for the grading, paving, curbing and laying sidewalks on Taylor St. Benjamin Havens is City Clerk.

Marion, Ind.—Until 2 p. m., July 5, by County Commissioners, for the construction of a road in Fairmont township. A. Y. Stout is Auditor of Grant County.

Vernon, Ind.—Until 11 a. m., July 5, by County Commissioners, for the construction of 25.6 miles of road in Campbell township. T. L. Thomas is Auditor of Jennings County.

Detroit, Mich.—Until 2 p. m., June 16, by Board of County Road Commissioners, for the construction of concrete roads on Mack and Gratiot Roads. John S. Haggerty is chairman of the Commission.

St. Joseph, Mo.—Until June 28, by L. M. Stallard, Highway Engineer, for contracts Nos. 153, 154, 155, 156 for grading Smith, Parker, Turner and Karnes Roads, respectively.

Melford, N. H.—Until 1 p. m., June 17, by H. C. Hill, State Engineer, Concord, New Hampshire, for the construction of 1,800 ft. of stone road in Melford.

Wakefield, N. H.—Until 1 p. m., June 17, by H. C. Hill, State Highway Engineer, Concord, N. H., for the construction of 6½ miles of native stone highway in Wakefield.

Camden, N. J.—Until 8 p. m., June 21, by Committee of Streets and Highways, E. Francis, chairman, for furnishing material and labor for performing the following work: For curb, gutter and crossing stones, paving and repaving material furnished and delivered or work performed from July 16, 1910, to July 16, 1911; for inlets, sewer pipe, traps, manholes, heads and covers and manholes, material furnished and delivered or work performed from July 16, 1910, to July 16, 1911; for cleaning sewers, from July 16, 1910, to July 16, 1911; for repair of brick and cement sidewalks and paving new sidewalks from July 16, 1910, to July 16, 1911, also for the construction of the following sewers: In and along Morgan St., from Master St. to Sixth St., along Sixth St. to Woodland St., on Woodland St. to Broadway, and on Fairview St., from Sixth St. to Broadway, and on Linden St., from 11th St. east.

Albany, N. Y.—Until 3 p. m., June 20, by Board of Contract and Supply, for the improvement of Swan St. from the north line of Sheridan Ave. to the south line of Clinton Ave. The work includes grading, curbing and paving the carriageway with granite blocks. Isidore Wachsman is secretary of the board.

Albany, N. Y.—Until 3 p. m., June 20, by Isidore Wachsman, secretary, Board of Contract and Supply, for unloading and hauling trap rock, oiling macadam pavements and repairing brick pavements.

Brooklyn, N. Y.—Until 11 a. m., June 22, by borough president, for 30 street improvement contracts, the largest being as follows: For regulating and repaving with asphalt pavement on a concrete foundation the roadway of St Johns Pl. from New York Ave. to Albany Ave., together with all work incidental thereto. The engineer's estimate of the quantities is as follows: 7,640 sq. yds. of asphalt pavement outside railroad area (five years' maintenance); 975 sq. yds. of asphalt pavement within railroad area (no maintenance); 1,060 cu. yds. of concrete for pavement foundation, outside railroad area; 135 cu. yds. of concrete for pavement foundation, within railroad area; 3,550 lin. ft. of new curbstone, set in concrete; 710 lin. ft. of old curbstone, reset in concrete; 44 noiseless covers and heads for sewer manholes.

Watertown, N. Y.—Until 8 p. m., June 17, by Board of Public Works, for the construction of about 6,000 sq. yds. of pavement in High St. with curbing, grading, culverts, sewers, catch basins and all other work connected therewith. E. W. Sayles is city engineer.

Cambridge, O.—Until noon, June 17, by County Commissioners for the grading and macadamizing of about one-half mile of road in Millwood Township. The estimated cost of the work is $4,704. J. C. Wonders is State Highway Engineer, Columbus, O.

Canton, O.—Until 10 a. m., July 6, by Board of County Commissioners, for the draining, grading and paving with brick one mile of road in Lexington Township in this county. J. H. McConnell is auditor of Stark County, Ohio.

Columbus, O.—Until noon, June 29, by County Commissioners, John Scott, clerk, for the construction and completion of the following street work: Engineer's Estimate No. 85: Grading and macadamizing the James T. Lazell Joint County Road on the line between Franklin and Delaware Counties, from the Columbus and Delaware Pike to the Wilson Pike, a distance of 3,705 ft., and located in Sharon Township, Franklin County, and Orange Township, Delaware County, Ohio, as follows: 1,800 cu. yds. excavation and berme; 1,900 tons crushed limestone; 725 tons crushed limestone screenings; 36 lin. ft. 10-in. cast iron pipe; clearing and grubbing. Engineer's Estimates Nos. 86-87: Grading, macadamizing and surface treating the James T. Lazell Joint County Road as above described. Engineer's Estimate No. 86: 1,800 cu. yds. excavation and berme; 1,775 tons crushed limestone; 400 tons crushed limestone screenings; 36 lin. ft. 10-in. cast iron pipe; clearing and grubbing. Engineer's Estimate No. 87: 9,900 gallons Heavy asphalt oil, carbo-via. tarvia "X."

Columbus, O.—Until noon, June 29, by County Commissioners, for all labor and material necessary for grading, macadamizing and improving roads as follows: Engineer's Estimate No. 74: The Westerville Road, from the north corporation line of Linden to the Mifflin and Blendon Township line, a distance of 13,706 ft; 4,400 cu. yds. excavation and berme; 10,100 tons crushed limestone; 3,200 tons crushed limestone screenings; 48, lin. ft. 12-in. cast iron pipe (laid); 60 lin. ft. 10-in. cast iron pipe (laid); 180 lin. ft. 10-in. first-class vitrified sewer pipe; grubbing all trees, stumps, etc. Engineer's Estimate No. 88: The Jackson Pike, from Greenlawn Ave. to the Frank Road east; 4,940 cu. yds. excavation and berme; 2,800 tons crushed slag; 2,090 tons crushed limestone; 1,200 tons crushed limestone screenings; 76 lin. ft. 12-in. corrugated pipe; 40 lin. ft. 18-in. corrugated pipe. Engineer's Estimate No. 89: Surfacing the Jackson Pike, from Greenlawn Ave. to the Frank Road east; 29,700 gallons Tarvia "X" or Carbo-Via. John Scott is clerk of the Board.

Charleston, S. C.—Until 11 a. m., July 9, by Bureau of Yards & Docks, Navy Department, Washington, D. C., for the construction of gravel paving at the United States Navy Yard at Charleston, S. C.

Leesburg, Va.—Until June 17, by County Clerk, for the construction of two miles of macadam road from Purcellville toward Silcott Springs, Loudoun County.

Milwaukee, Wis.—Until 10:30 a. m., June 16, by Board of Public Works, for the work of grading and macadamizing the roadway, paving the gutters with stone, from Dondulac Ave. to Locust St. in 22d Ward. Charles J. Poetsch is chairman.

Y.—Paving.—Board of Contract and Supply awarded the following contracts to the Barber Asphalt Co., for paving at $1.79 per sq. yd.: Asphalt with artificial curb—Conkling Ave., Winner Ave., George Place, Springdale St., Leeds St.; asphalt with natural or stone curb—Canal St., Cedar St., James St. and Jay St.

Watertown, N. Y.—Timbering & Paving—Owego Bridge Co., Owego, N. Y., at $5,300, for retimbering Arsenal St. viaduct with creosoted wood block pavement on viaduct. Bids were opened June 3.

Whitesboro, N. Y.—Paving.—Warren Bros. Co., Boston, Mass., for the construction of 24,700 sq. yds. of bitulithic.

Bellefontaine, O.—Paving.—Hamilton Bros. & Hoskins, at $32,224, for paving South Main St.

Cincinnati, O.—Road—August Silk, 5th and Broadway, city, at $7,024, for the construction of Montgomery pike.

Springfield, O.—Paving.—Peters Bros., Chicago, Ill., at $61,043, for paving Yellow Springs St., with sheet asphalt with Bolin brick between the car tracks and for 18-in. on either side of the rails.

Bartlesville, Okla.—Paving—Kansas Bitulithic Co., Kansas City, Mo., for the construction of 8,000 sq. yds. of bitulithic.

Albany, Ore.—Paving.—Warren Construction Co., Portland, Ore., for the construction of 22,275 sq. yds. of bitulithic.

Portland, Ore.—Paving.—Pacific Bridge Co., city, for the construction of 8,176 sq. yds. of bitulithic.

Portland, Ore.—Paving.—Warren Construction Co., city, for the construction of 47,500 sq. yds. of bitulithic.

Portland, Ore.—Paving.—Pacific Bridge Co., Portland, Ore., for the construction of 16,162 sq. yds. of bitulithic.

Portland, Ore.—Paving.—Warren Construction Co., city, for the construction of 12,186 sq. yds. of bitulithic.

Portland, Ore.—Paving.—Oregon Hassam Paving Co., for the paving of Eleventh and Milwaukee Sts., from Hawthorne St. to Holgate St.

Minersville, Pa.—Paving.—McConnell & Fitzpatrick Co., Pittson, at $2.19 per sq. yd., for the paving of a portion of Sunbury St. with brick.

Philadelphia, Pa.—Paving.—Edwin H. Vare, for the completion of the Southern Blvd., for which $400,000 is available; McNichol Paving &

Construction Co., for the completion of the Northeast Blvd., for which $300,000 is available.

Scranton, Pa.—Road.—John Harrigan, New York, at $1.39 per sq. yd., for the construction of the new county road in this county with Genasco.

York, Pa.—Paving.—Juniata Paving Co., city, for the construction of 4,300 sq. yds. of bitulithic.

Wilkesbarre, Pa.—Paving.—Herrick Construction Co., Stroudsburg, at $75,000, for the paving of Truesdale Road, from Warrior Run to Nanticoke, Clark's Cross Road, two miles of the Middle Road, completing it from Wilkesbarre to Nanticoke, Barney & Orchard Sts., Warrior Run and Spring Sts., Newton. The roads will all be macadamized with the new standard binder.

York, Pa.—Paving.—Standard Bitulithic Co., New York, N. Y., for the construction of 14,466 sq. yds. of bitulithic.

Seattle, Wash.—Grading.—Olson & Mellen, at $135,770, for grading and regrading of Dexter Ave., and others adjoining the Westlake improvement.

Princeton, W. Va.—Paving—T. Towlee & Co., city, at $35,000, for the construction of brick and tarvia pavements in this city, also at $30,000 for the construction of sewers, sanitary. Bids were opened June 8.

Tacoma, Wash.—Grading.—Lister Construction Co., at $2,184, for the grading of North 14th St., and 16th St., between Cedar St. and the west line of Baker's addition.

Winnipeg, Man.—Macadam.—The City Engineer of Construction, Winnipeg, has been awarded the following contracts for constructing macadam for the city: On lane in rear of Emily St., $860; on lane west of Gladstone School, $955; on lane between Rose and Royal Sts., $1,148; on lane between Agnes and Victor Sts., $3,739.

Winnipeg, Man.—Granolithic Walls.—Board of Control on June 6 awarded the following contracts for granolithic walks: Thos. Jacobson & Son, Winnipeg, on Pine Ave., $3,823; on Sherbrooke St., $1,527; on Nena St., $963; on Elmwood Ave., $1,280; Tweed Ave., $935; Dufferin Ave., $1,493. J. Devitt, Winnipeg, Langside St., $2,024. Engineer of Construction, Winnipeg, on Burrows Ave., $3,913; Bannatyne St., $622; Princess St., $1,331; Bannatyne Ave., $176; Pembina St., $1,769; Manitoba Ave., $540; Preston Ave., $347; Higgins Ave., $1,246; South Side Bannatyne Ave., $180; Main St., $1,406; Glenwood Crescent, $753; Pembrina St., $211; Bannatyne Ave., $676; Kelvin St., $323; West Side Victoria St., $746; Harbison Ave., $943.

SEWERS AND WATER SUPPLY.

Macon, Ga.—Sewer.—R. S. Clemons Co., city, at $5,632, for the construction of the new auxiliary system of sewers, which will be laid in the Vineville, North Highlands and newly annexed parts of the city.

Muscatine, Ia.—Sewer.—J. H. Seldon, by the Rock Island Railroad, for the construction of its share of the Papoose sewer extension.

New Hampton, Ia.—Sewer and Water Main—Fraser & Danforth, Rochester, Minn., at $0.55 per ft. for the construction of 4,000 ft. of 8-in. sewer, and at $0.48½ per ft. for the construction of 3,000 ft. of 4-in. water mains. The work includes manholes, flush tanks, hydrants and valves at $40, $68, $34, $34.50 and $14.50 respectively. Bids were opened June 1.

Batesville, Ind.—Water Mains.—Bourbon Copper & Brass Works, Cincinnati, O., at $3,130, for the extension of the water mains in this city.

Baldwin, Kan.—Sewer System.—Squire Electric & Construction Co., for the installation of a sewer system in this city.

Osage, Kan.—Sewer System.—Boyd Construction Co., Kansas City, Kan., at $41,000, for the construction of a complete sanitary sewer system in this city.

Hubbill, Mich. Sewers—The Pearce Hardware and Furniture Co., Lake Linden, Mich., at $1.87 per ft. for 300 ft. of 30-in. sewer tile; at $0.14 per ft. for 100 ft. of 8-in. sewer tile; at $14 for one 30x30 Y; at $14 for one 30x30x20 Y, and at $7.48 for one 30x18 reducer.

Baltimore, Md.—Sewers.—Board of awards on May 25 received the following bids on sanitary contract No. 52, lateral sewers in district 19-A: William McCarthy & Co., Pittsburg, Pa., $105,878; B. F. Sweeten & Son, city, $110,005; D. V. Ault & Co., city, $122,631; Irwin Bros., Greenville, O., $133,654.

Ann Arbor, Mich.—Sewers.—Following contracts have been awarded by the board of public works for the construction of six sewers: Koch Bros. for the construction of sewers in districts No. 41, 36, 37 and 40; E. L. Schneider, for the construction of two sewers in the city.

Bellefontaine, O.—Sewers.—W. H. Ralston, Mt. Vernon, at $2,419, for the construction of sewers in South Main St.

Middletown, O.—Sewer—Garver Construction Co., Hamilton, O., for the construction of 6,850 ft. of concrete sewer on Michigan Ave. Bids were opened June 7.

Portland, Ore.—Sewers.—Bechill Bros., at $19,576, for the construction of the Powell St. sewer system; William Lind, at $18,683, for the construction of the East Eighth, East Ninth and East Tenth St. systems.

Aberdeen, S. D.—Sewer.—J. J. Dunnegan, at $16,000, for the construction of about 32 blocks of sewer in this city this summer.

Morristown, Tenn.—Sewer System.—Edwards Construction Co., Hickory, N. C., at $40,000, for the construction of sewers; Municipal Engineering & Construction Co., Chattanooga, Tenn., for the construction of the outfall and disposal plant.

Milwaukee, Wis.—Sewers.—Geo. E. Zimmerman, 3102 McKinley Blvd., city, at $1.34 per lin. ft., for the construction of pipe sewers in Elm St., from 41st St. to 47th St., and in 47th St. from 12½ ft. south of Elm St. to Elm St., and in Elm St. from 47th St. to 48th St.; C. J. Culley, 2018 Cedar St., city, for the construction of a pipe sewer in 25th St. from Vliet St. to Cold Spring Ave., at $1.35 per lin. ft.

Ottawa, Ont.—Water Works.—Gordon Law, at $1,650, for the flexible joints for the water works intake. The bid is at $165 per joint.

EXCAVATION, MISCELLANEOUS, MATERIALS.

Mobile, Ala.—Soil—A. C. Spotswood, at $2.25 per cu. yd., for furnishing and placing top soil at Fort Morgan, Ala. Bids were opened June 7.

Whipple Barracks, Ariz.—Ice Plant—Henry Rockmark, Prescott, Ariz., at $15,050, for the construction of an ice plant in this city; The Frick Machine Co., Waynesboro, Pa., at $8,450, for the installation of the machinery. Bids were opened May 31.

Fort Smith, Ark.—Steel Cages.—Diebold Safe & Lock Co., at $16,000, for furnishing steel cages for the new county jail. The cages are to be made of solid sheets of chrome steel instead of bars.

Hot Springs, Ark.—Elevator—Otis Elevator Co., St. Louis, Mo., at $4,984, for removal of old elevator and installation of new modern electric elevator complete in old Administration Bldg., Army and Navy General Hospital. Bids were opened June 8.

Denver, Colo.—Building.—John W. Tomlinson, at $102,063, for the building of the addition to the county hospital.

Fort Dupont, Del.—Boiler Pump, Etc.—Camden Heating Co., Camden, N. J., at $6,993, for furnishing and installing in the pump house at this place two Babcock & Wilcox water tube boilers; one Cochran feed water heater and one Copes feed water regulator, and making necessary removals and changes in piping. Bids were opened May 23.

Franklin, Ind.—Voting Machines—Empire Voting Machine Co., Rochester, N. Y., at $10,500, for furnishing 14 voting machines. Bids were opened June 6.

Lawrence, Mass.—Building.—Aberthaw Construction Co., of Boston, Mass., for the plain and reinforced concrete work in the additions to the Pacific Mills, this city. There will be nearly 16 acres of concrete floors, including the following: Printing bldg., 720 ft. x 85 ft., two floors and columns; Dye House, 994 ft. x 251 ft., one floor and roof; Finishing bldg., 600 ft. x 90 ft., three floors, mushroom construction; the floors of the power station, 330 ft. x 85 ft. and a coal pocket.

Lowell, Mass.—Concrete Piles.—Raymond Concrete Pile Co., New York and Chicago, for the placing of 1,400 concrete piles in the foundation of a store house to be built for the Massachusetts Cotton Mills at this city. Lockwood, Greene & Co., architects and engineers; Aberthaw Construction Co., general contractors.

Joplin, Mo.—Depot.—Manhattan Construction Co., New York, for the construction of the new union depot in this city. The contract calls for the erection of a modern building of reinforced concrete construction. The building will be 262 ft. long and 82 ft. wide.

Cincinnati, O.—Elevators—Otis Elevator Co., at $6,535, for the construction of two electric elevators in Hamilton County court house, on Court and Main Sts.

Cleveland, O.—Power Plant.—F. C. Werk, New England Bldg., city, for the construction of a power plant for operating ore handling machinery at Randall for the N. Y. P. & O. Dock Co. The building will be of fireproof construction, 115 ft. by 42 ft. in size, and will have a brick stack 150 ft. high. The contract includes the drilling of wells and installing water softening plant and compressor plant.

Fort Sam Houston, Tex.—Plumbing Supplies—F. W. Axtell Construction Co., San Antonio, Tex., at $2.10 for eight L's; at $2.25 for eight reducers; at $3.05 for eight T's; San Antonio Machine Co., at $1.65 for 16 bushings; at $1.70 for two scrapers; at $4.05 for 64 ft. shafting; at $3.95 for eight minons; at $40.65 for 37 valves, assorted; Jas. B. Clow & Son, Chicago, Ill., at $20.59 for 36 ft. biar's rod; Alamo Iron Works, San Antonio, Tex., at $17.06 for 72 ft. black pipe. Bids were opened June 2.

Toronto, Ont.—Brick Chimney.—M. W. Kellogg Co., 50 Church St., New York, N. Y., for the construction of a brick chimney at the pumping station of the filtration plant at the Island.

PROJECTED WORK.

Bridges.

Items Arranged Alphabetically by States.

Wilmington, Del.—County Engineer has been instructed to prepare plans for the construction of a new concrete bridge at Roseville over White Clay Creek, to replace the old covered bridge at that point.

Washington, D. C.—Secretary of War has authorized the construction of a bridge, viaduct and automobile highway across Riverra beaches on the ocean front joining at Atlantic City.

Rupert, Idaho.—Work on the new bridge across the Snake River will begin soon, as the State has appropriated $10,000, and Lincoln and Cassia Counties each $3,000, for the project. The remainder necessary for the work, $3,000, will be raised by public subscription.

Harmon, Ill.—Township Highway Commissioners are to hold a special election to vote on the matter of constructing a number of concrete bridges throughout Harmon Township.

Moline, Ill.—The United States Senate has passed the bill granting the Moline-Bettendorf Bridge Co. a charter to construct a bridge over the Mississippi River between the two cities. According to the plans which already have been drawn the structure will have two draw spans. The work is estimated to cost $1,000,000.

Rushville, Ill.—Bridge Committee of the County Board of Supervisors have granted county aid for the construction of two new bridges. One over Flower Creek near Birmingham and the other over Crane Creek in Bainbridge Township near Newberrytown. The estimated cost of the structures is $1,000 each.

Gary, Ind.—Bill has been passed at Washington, D. C., authorizing the Gary Land Company to construct two bridges across the Grand Calumet River in Lake County, Ind. A bill authorizing the construction by the Indiana Steel Co. of two bridges across the same river in Lake County was also passed.

Jeffersonville, Ind.—No bids were received for the construction of the county bridge over Logan Creek, and the work will be readvertised. Peter Nachand is county clerk.

Newport, Ind.—All bids received June 6 by County Commissioners for the construction of a 40-ft. girder bridge with concrete floor and abutments have been rejected because they exceeded the $1,500 appropriation. The work will be indefinitely postponed. H. T. Payne, county auditor.

Girard, Kan.—A delegation of residents of Lincoln Township have filed a petition with the County Commissioners asking for the construction of a new bridge across Cox Creek to be located one mile north of Arcadia. The Board will take up the matter later.

Topeka, Kan.—Board of County Commissioners are to hold a meeting to consider the construction of several bridges.

Quincy, Mass.—War Department has ordered Quincy, Weymouth and Hingham to rebuild the Hingham bridge which crosses the Weymouth Back River.

Flint, Mich.—City council at the last meeting ordered the resurfacing of the bridge at Fenton St. Repairs will be made also on the Stevenson St. bridge.

Deer Creek, Minn.—Village council has decided to call a special election to vote on the matter of constructing a new bridge over the creek at the Creamery. The expense of building the structure would be borne by the village and council.

Minneapolis, Minn.—Great Northern R. R. officials have notified City Engineer that construction work will be started soon on the viaducts at 15th Ave. and Fourth St. S. E., and University, between 13th and 14th Aves. S. E.

Maryville, Mo.—Board of County Commissioners are preparing for the construction of a number of steel bridges. The work is estimated to cost $20,000.

St. Joseph, Mo.—County Court has ordered the construction of a new bridge over the creek on the proposed Dittemore Road near South St. Joseph.

Newark, N. J.—United States Engineer, Maj. R. R. Raymond, has granted permission for the construction of a bridge across Absecon Channel, from Inlet to Rum Point. The plans have already been made and the cost of the structure is estimated at $1,000,000.

Plainfield, N. J.—County Commissioners have appointed a committee to investigate the necessity of building a bridge on Effingham Place, Westfield, and report will be made at the next meeting.

Trenton, N. J.—Residents of River Drive Ave. are to again take up the matter of constructing a bridge across the water power to connect the avenue with the river mall.

Drayton, N. Dak.—Plans have been prepared for the construction of the proposed steel bridge over the Red River at this place to replace the old Pontoon bridge. The new structure is estimated to cost about $53,000.

Grand Forks, N. Dak.—Petitions have been filed with the Bridge Committee of the County Commissioners for the construction of several steel bridges in District No. 4, and the matter will be taken up at once.

Cincinnati, O.—City Engineer has completed plans for the construction of the proposed viaduct over the railroad tracks at Monmouth St., and a committee of city officials and representatives of the Chesapeake & Ohio, Louisville & Nashville and S. C. & C Street Railroad Companies, to consider the matter.

Zanesville, O.—County Commissioners are to issue bonds amounting to $200,000, for the construction of the Fifth St. bridge.

Pawhuska, Okla.—County Commissioners are planning the construction of a concrete structure over William Penn Creek, near Hominy,

Water Rates a False Index of the Costs of Water Service.

The face value of cost figures of municipal operation is always to be accepted with caution. When the Boston Finance Commission came to investigate the manufacture of valves, hydrants and fittings at the water department shops of that city its engineers found that the book costs indicated a material saving over the market prices of similar articles. They found also that:

> The cost of holidays and other lost time for which men are paid is not included, neither is the cost of superintendence, clerical service, fuel, engineer's and firemen, and other shop labor which is indirectly involved in manufacture, but which cannot be charged to any particular job of work. Further, all interest and depreciation charges upon the plant are omitted."

In another column of this issue we publish a very interesting paper and discussion on the fallacy of setting up the water rates of various cities as an index of the comparative costs of furnishing water, or of the comparative efficiency or economy of water supply service, in those cities. It is clearly indicated that such comparisons are usually worse than valueless because of the difference in local conditions and the general failure to give any data as to these conditions. Perhaps the worst sufferers, particularly in past years, from such fallacious comparisons, have been the privately owned plants, whose rates have been held up as examples of extortion by opposing them with the lower rates of selected municipally operated plants. The unfairness of this procedure is plainly evident for the reasons stated even assuming that the rates of the municipally owned plants represent true costs. That they generally do not is indicated by the discussion; they seldom represent more than a portion of the actual cost, the remainder of which is paid by the water consumers under another guise. It is not our purpose to discuss here the advantages or disadvantages of municipal ownership of water-works; but it is worth pointing out that the nominal cost of water as indicated by the rate per thousand gallons charged by municipal plants is seldom the full charge for cost of service. This is important to keep in mind when propositions for municipal manufacture of valves and hydrants, municipal asphalt plants, municipal stone crushing plants, etc., are urged, as they frequently are, on the plea that saving to the taxpayer is bound to result as exemplified by the generally lower rates for water in cities having municipally operated water-works.

When Is It Safe to Remove Forms in Large Arch Concrete Sewer Work.

What is the reasonable time a contractor should be required to keep his forms standing under reinforced concrete sewers of, say, 10 to 15 ft. in size? Recent specifications for large concrete sewers stipulate merely that the forms shall remain in place "as long as the engineer deems necessary." What is the time, specifically, according to prevailing practice that engineers deem necessary? A compilation of such records as we have been able to get at quickly shows a range of time of from 2 to 7 days. Obviously it is a question of considerable financial importance to the contractor, whether he must keep his centers in place 2 days or 7 days. Sewer centers or forms are invariably used over and over and the sooner a section can be removed and put ahead the fewer are the centers required for the same rate of progress or the greater is the progress for the same length of centers. To hold the centers under the sewer longer than is necessary means, of course, an additional expense which gives nothing in return except, perhaps an extra assurance of safety. It is a popular maxim in engineering that "one can't be too safe," but as practical matter of fact, every experienced engineer knows that one can be too safe. This is nowhere more true than in the question of removing forms from concrete work. It is quite likely that this statement will call down criticism, but we are nevertheless convinced of its truth. No one will contend that a time schedule of general application for removing forms is possible. Concrete sets, hardens and gains strength too variably under different conditions of materials and climate to permit. The matter is further complicated by the fact that the nature of the stresses in the number to be relieved of support determines the strength and stability required to insure safety. Judgment must invariably decide when it is safe to remove forms, but it should be the judgment of caution and not of cowardice. The common defense of "forms removed too soon" offered for the majority of failures of concrete buildings has, wrongfully, we believe, emphasized the danger from this course. We are convinced that more concrete buildings have failed from poor design than from poor materials and workmanship, and more have failed from the latter cause than from removing the forms too soon. Form costs are a large item in the total cost of concrete work of any degree of complexity and every reasonable effort should be bent to reducing them. The most promising way that has developed is so to design the concrete structure and the forms that repeated and frequent re-use of forms is possible. It is evident that the degree of this possibility depends upon the alertness of the engineer in seeing when his concrete can be put on its own resources and his forms freed for further use. To return to our first question, we should be glad to learn the practice and opinions of our readers.

Data on Steam Rolling in Ireland.—In the north riding district of Tipperary, Ireland, the average cost of steam rolling, including the supplying and breaking of stone, spreading, rolling, watering and brushing, is from $1,115 to $1,160 per mile. This is based on the following data: 4½ to 5 tons of metaling, principally mountain limestone, is applied to each lineal perch of road, giving a coating averaging 5½ ins. in thickness. The cost of quarrying is about 16 cts. per ton, breaking about 24 cts. per ton, horse transport about 18 cts. per ton and spreading 8 cts. per ton, making a total of 57 cts. per ton for the stone applied to the road. Watering, sweeping, etc., costs 10 cts. per ton, rolling about 6 cts. per ton, making a gross total of about 82 cts. per ton or $3.60 to $3.80 per lineal perch of road rolled. The engine rolls about 70 tons daily.

Data on Street Work at Somerville, Mass.—During 1909 2,396 sq. yds. of new brick sidewalk and 5,390 sq. yds. of granolithic and tar concrete sidewalks were constructed in the city of Somerville, Mass. The average cost for the year for laying brick sidewalks, the work being done by the Highway Department, was $1.14 per sq. yd.; the average cost of granolithic sidewalks was $1.60 per sq. yd. The average cost for the year of setting edgestone with gravel sidewalk was $1.01 per lin. ft. During the year a portion of Medford St. was paved with granite blocks, grouted with pebbles and tarvia, the work being done by the Highway Department by day labor. The old granite gutter blocks and car track paving on the street were used with new granite blocks to complete the work. A total of 2,547 sq. yds. of granite block pavement was laid, the cost being as follows:

	Total.	Per sq. yd.
Labor, teaming, rolling	$2,455	$0.964
Paving blocks (37,970)	2,278	.894
Tarvia (7,974 gals.)	528	.207
Pebbles (200 tons)	255	.099
Changing catch basins, manholes, etc.	54	.022
Total	$5,570.45	$2.19

Another piece of work done by the Highway Department by day labor was the macadamizing of a portion of Broadway with trap rock, using tarvia for a binder. A total of 2,950 sq. yds. of pavement was constructed, the cost of this work being as follows:

	Total	Per sq. yd.
Labor, teaming, rolling	$1,085	$0.367
Stone (768 tons)	1,104	.379
Tarvia (9,562 gals.)	629	.213
Changing catch basins and miscellaneous work	68	.024
Total	$2,886	$0.984

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Methods of Stuccoing with Suggestions for Finishing and Coloring Stucco.*

BY ALBERT MOYER.†

The history of stuccoes does not furnish sufficient information and data to be of practical value in the manufacture of the present day Portland cement stuccoes. There are records dating 35 B. C. of stuccoes made from vastly different materials than are of economical use at the present time, and we find that such stuccoes were almost invariably used in warm climates where the action of frost would not tend to disintegrate the rather poor material which was then available. There is every reason to believe that originally these stuccoes were intended to cover up and protect inferior building stone and sunburned straw brick. The archaeology of stucco would tend to show that from an artistic standpoint this method of decoration was a development of the wattled buildings, which were plastered with clay and different muds hardened by being baked in the heat of the sun. Therefore, in this instance, the use of clay plaster over wattled houses was to protect an inferior building material.

Today succo is used for a similar purpose, that of protection and pleasing surfaces. It would, therefore, seem advisable to recommend a material which would best serve the purpose of protection and artistic merit. Stucco or plaster should never be used as an imitation of other building material.

To cover brick with plaster and tint plaster with fresco is perfectly legitimate the plaster is passed upon as panel or canvas, but to cover brick with cement and to divide this cement into joints that it may look like stone, is to tell a falsehood, and is just as contemptible a procedure as the other is noble.

To carry out these ideas we desire to recommend only Portland cement stucco for exteriors, as this is the only hydraulic material which will stand the action of the elements. From the artistic side we would also recommend such surface finish for stucco as will cause both natural color and pleasing texture. It would be well, therefore, to expose to view the aggregates used and avoid as far as possible exposing the bonding material, Portland cement.

There is no artistic reason for allowing only the bonding material to be displayed to the eye. On very large jobs the surface can be cleaned off by means of a sand blast, and on smaller jobs the surface may be cleaned exposing each grain of sand by means of muriatic acid in dilute solution, 1 part commercial muriatic acid to 4 to 5 parts clear water

Where white aggregates are used the surface may be cleaned off with a solution of sulphuric acid, 1 part acid to 4 to 5 parts clear water. The sulphuric acid leaves a white deposit and therefore should not be used excepting where the aggregates are white.

Another method is to scrub the surface while yet green, say within 24 hours, with a house scrubbing brush and clear water. This is more difficult than the others for the reason that if the stucco is allowed to remain too long before scrubbing, it will be too hard to remove the coat of neat cement from the outside of each particle of sand or other aggregates; and if scrubbed when it is too soft the surface may be damaged and difficult to repair.

If the character of the available aggregates will not present a pleasing surface when exposed, the following surface treatment may be used:

While the last coat is still thoroughly damp, apply a Portland cement paint composed of 1 part Portland cement, 12 per cent of the volume of the cement of well hydrated lime, pulverized form, and 1 part of the volume of the cement of fine white sand. Mix with water to the consistency of cream or the ordinary cold water paint. Stir constantly and apply by using a whisk broom throwing this paint on with some force.

Keep this finish surface damp for at least six days or longer if economy will permit. Do not allow it to dry out in any one place during the week. If necessary protect by hanging tarpaulins and using a fine spray of water playing on several times during the day by means of a hose. This will give a pleasing light gray color of excellent texture.

Stucco may be applied to various building materials. There is hardly any reason at the present time for stuccoing stone buildings, the procedure at best is difficult and hardly to be recommended. Our building stone is usually an excellent material and therefore, does not require either protection or covering to produce pleasant effects.

New brick may be covered with stucco very successfully. The joints should be first raked out half an inch. The brick must be saturated with water. It is always best to start stuccoing at the top of the wall and work down between the pilasters or corners, finishing a whole strip or whole side wall from top to bottom in one day. Thus no streaks or cracks are formed where one day's work ends and another begins. By this method the wall can be kept wet ahead of the work by means of a hose.

The second coat should be put on as soon as the first coat has stiffened sufficiently to hold in place and stand the pressure of the trowel. This second coat should be well scratched and the finished coat applied while the second coat is damp. The finish coat should then be kept wet, protected from the rays of the sun and as far as possible from drying out. This can be done by hanging wet cloths over same. This rule of keeping each coat moist until the other coat is applied and protecting after applying the finish coat, must be observed in all forms of Portland cement stucco.

If the stucoc is to be applied to metal lath or wire cloth the metal should be plastered on two sides so that it is entirely encased in mortar in order to avoid rusting. If this is impracticable then the metal lath or wire cloth should be dipped in a paint made of equal parts of neat Portland cement and water. Immediately after dipping, the metal lath or wire cloth should be tacked onto a frame in the position it is intended to occupy. As soon as the neat Portland cement has hardened on the metal apply the first coat to stucco. Hair should be added to the mortar to be applied on wire mesh or expanded metal: 1 bag of cement, 1 lb. of hair.

If plaster boards are used they should be nailed on the frame work of the building, leaving at least ¼ in. joint between each plaster board. This joint to be filled in with lime putty, otherwise each plaster board will cause square cracks on the outside of the stucco the size of each board.

A convenient method of waterproofing plaster boards is easily available. The boards may be painted with two coats of any of the reputable bitumen waterproof paints to which plaster adheres. Then about 24 hours after the bitumen paint has been applied, and within six days, apply the first coat of stucco.

For stucco on terra cotta blocks great care should be exercised in keeping the blocks thoroughly saturated with water, for if the blocks are not saturated they will pull the water out of the mortar and it will crack and disintegrate. Portland cement requires water until it has thoroughly hardened, which ultimate hardening usually takes from 14 days to a month. It is not always necessary to play the hose on the wall for a month, although it would be advisable. The dews at night, the dampness in the atmosphere and the rain will furnish the necessary moisture provided the material on which the mortar has been plastered has not too great an affinity for water.

In order to prevent the porous hollow terra cotta tile from sucking the moisture from the stucco and also to furnish waterproofing and an additional bond other than that which would be given by the key, it is good practice to paint the surface of the dry terra cotta blocks after having been erected in the wall with two coats of bituminous paint, equal to such paints as Dehydratine, Minwax, R. I. W., or X-Hydro-Plastic. It is important that the first coat of stucco is placed over this paint after 24 hours and within six days.

Proportions for a good stucco should be 1 part Portland cement and 2½ parts coarse clean sand. (If coarse clean sand is not available use only 2 parts of sand.) Add 10 to 15 per cent of well hydrated lime, dry pulverized, of the volume of the cement.

If it is the desire of the owner or architect to use the exposed aggregate method interesting natural colors can be obtained by using the following materials instead of sand, the same proportions. Green, red, buff, black or white marble screenings all passing a No. 8 screen and all collected on a No. 40 screen. These different colored marble and different colored sand where obtainable, can be used singly or in a combination. When exposed by scrubbing or the acid treatment very interesting results are obtained.

In mixing stucco great care should be exercised to obtain the thorough incorporation of cement, sand and the other aggregates. The sand and cement should be mixed together dry until an even color results. This can be done by shoveling and raking while shoveling. Water should then be added being careful not to add too much water at a time and not to get the resulting motar too wet so that more sand or cement has to be added. Be very careful to bring the resulting mortar up to the proper consistency for plastering.

It is advisable to add to the mortar from 10 to 15 per cent of the volume of the cement of well hydrated lime. This should be mixed dry with the cement and sand before the water is added. The addition of hydrated lime tends to fatten the mortar making it more adhesive and impervious.

Another specification which we believe will prove of considerable value is the addition of mineral oil to wet mortar. After the water is added and thoroughly mixed with the mortar add 15 per cent of mineral oil and remix. If a light effect is to be produced use white oil, such as Oil Petrole, manufactured by the Chesebrough Mfg. Co. When the oil is to be mixed with the mortar it is always advisable to use hydrated lime as we thus have a larger amount of emulsifying material.

The color obtained by the scrubbing or acid method is limited only to the available sands or marble screenings, the color will be the color of the aggregates. An excellent green can be obtained by adding 8 per cent of the weight of the cement of cromium oxide. This should be mixed dry with the sand, cement and hydrated lime.

Always keep in mind that the surface to which the mortar is to be applied must be thoroughly saturated with water, each coat of stucco must be kept moist and the final coat must remain moist for at least one week and longer if economy will permit.

Stucco should not be troweled to a smooth surface. The artist painter would never think of smoothing the paint on his canvas by means

*Other valuable practical articles on stucco work will be found in Engineering-Contracting for Aug. 11, 1909, and Jan. 12, 1910.

†50 Pine Ave., New York, N. Y.

of a straight edge. Texture and color are necessary if artistic results are to follow. By using the suggestions above outlined, the architect is privileged to select the aggregates from which the stucco is made and has in fact as great play in the planning of the color, tone and texture as has the artist in mixing the paints on his palette.

Methods and Costs of Molding and Setting Concrete Fence Posts.

The following notes of methods and costs of molding reinforced concrete fence posts and of fence construction with concrete posts are taken from a bulletin issued by the Office of Public Roads, Washington, D. C. While the information has been prepared especially for farmers, many of the data are of general application and so are valuable for contractors.

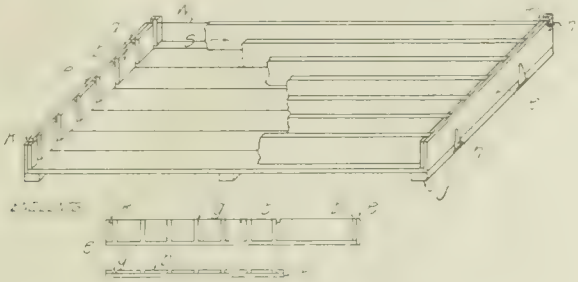

Fig. 1—Gang Mold for Square Posts Without Taper.

Wooden Molds.—Wooden molds good enough for ordinary demands are very easily made. White pine is the best wood for this purpose, but at the same time it is the most expensive. Cheaper kinds of lumber, which are easy to work with, may be used. Molds made of 2-in. planks, dressed on both sides, form neater posts, but lighter lumber may be used, if the forms are well braced.

In imitation of the manner in which tree trunks grow, concrete posts are usually made tapering in size from butt to top. While this method may add a little to the appearance of the post and effect a slight saving in concrete, this saving is largely offset by the additional cost of the carpenter's work and of the lumber used in making the molds. Theoretically, the tapering post has a better design than the one with straight sides, but for ordinary use one is as good as the other.

In making these molds, dressed lumber, planed from the rough, should be used. The proper dimensions for rough timber are 1 or 2 ins. thick and 4, 6, 8, 10, or 12 ins. wide; for dressed lumber they are ⅞ or 1⅝ ins. thick and 3⅝, 5⅝, 7½, 9½, or 11½ ins. wide.

Molds for Square Posts.—Molds for posts that are square or nearly square in cross section are simple and easy to make. They are built in three patterns: (1) For posts without taper; (2) for posts tapering on two sides; and (3) for posts tapering on all four sides.

In order to avoid a sharp, irregular edge, neater posts are made by fastening a narrow strip of canvas or leather on the inside of the side board at the bottom of the mold, so that when the mold is put together and the concrete post molded the corner of the post will be rounded. A similar effect on the upper side of the post is produced by using a trowel or an "edger"—a special tool for rounding the corners of concrete walks or curbs. Clay plastered in the corner of the mold or wooden strips tacked to the sideboard will answer the same purpose. Such strips must, however, be as small as possible or else they will crowd out much concrete, and thus cause the reinforcement to be located too far within the post to obtain the best results. Ordinarily the reinforcement should be placed within ¾ in. or 1 in. of the outside of the post.

The easiest and cheapest mold to make is the straight mold, or one for a post which does not taper. Such molds are merely long boxes built with various schemes for making the molding of the post a simple matter. On account of the amount of lumber saved and the ease with which these molds are filled, straight molds are generally made in "sets" or "gangs," by constructing several side by side with a continuous bottom and end pieces. Figure 1 shows the plan of a "gang" mold for making six posts, each of which is 7 ft. long and 5x5 ins. at both ends. On account of the rigid method of construction, all lumber used in this mold, with the exception of the 2x4 in. stringers, may be 1-in. dressed boards. The bottom is of "ship lap" cut to the dimensions indicated on the drawing and nailed tightly to the three stringers. The end pieces *E* are made up of one board each to which are nailed blocks *B* 1 in. in thickness and 5 ins. square, placed so as to allow the side pieces *S* to slip between them. The end pieces are hinged to the bottom with strap hinges *H*, in which the fixed pine is replaced by a loose pin of a nail. This arrangement allows the end piece to be removed at will. Shutter hinges or loose-pin door butts of heavy wrought iron may also be used as hinges. All the side pieces are alike and interchangeable.

The form is set up ready for use in this manner. The end pieces are placed in position by inserting the loose pin of the hinges. Lengthened wagon rods *W*, with crank nuts *N*, at one end, are dropped into the slots *K*, and the sideboards are then placed in the grooves *G*, between the blocks on the end pieces. All the pieces are then drawn together by tightening the crank nuts *N*. The slots for these rods should be faced with an iron strap and should be so centered that the rods, when tightened, will lie against the sides of the outer side pieces and act as stiffeners for them. With this arrangement, by merely loosening the crank nut on the end of the rods, when the concrete has sufficiently set, the end and side pieces may be removed without disturbing the posts and placed on a similar bottom board, and another batch of posts may be made.

By another method the end piece is hinged to the bottom like the end gate of a spring wagon bed, and the method of fastening is the same as generally used on spring wagons—spring elbow catches fastened with screws to the side boards and flush with them—so as to allow the concrete to "struck" when the molds are filled. If the molds are constructed in this way, the outer sideboards should be made of 2-in. lumber.

Posts tapering on two sides are preferable to the straight posts in some respects. A satisfactory size for this style is produced in a mold 4½ ins. deep by 6 ins. wide at the butt, 4½x4½ ins. at the top, and 7 ft. long. These posts may be made more easily in gang molds, which are built so as to make the adjoining posts lie butt to top. By considering that the end positions of every post are reversed, it is possible to build this style of mold according to the directions set forth under straight molds.

Square posts are also made tapering on all sides. A line post of a satisfactory size may be obtained by making the molds 5 ins. deep by 6 ins. wide at the butt, 3 ins. deep by 4 ins. wide at the top, and 7 ft. long. Since all the butts must be placed at one end and all the tops at the other, this arrangement causes the continuous bottom to be 1 ft. wider at one end than at the other. The variation in the length of the sideboards and of the molded posts is, however, so slight (hardly ¼ in. at the greatest) that no attention need be paid to it and all sideboards can be made the same length.

Molds for Triangular Posts.—Triangular molds without a taper are easily constructed in "sets" or "gangs." On account of their shape, they may be braced at any point and, as a result, 1-in. boards may be used in their construction. In Fig. 2, molds for three sizes of triangular concrete posts are shown. The two boards are hinged together at the ends and quarter points on the bottom by ordinary 3-in. wrought-iron strap hinges bent to conform to the shape of the mold and fastened with ¾-in. screws.

Sharp corners on the finished post are somewhat objectionable, on account of their roughness and sharpness and the possible waste of material. This undesirable feature is avoided by placing a wooden tongue or strip *T* in the bottom of the form, as shown in Fig. 2, and by rounding the corners at the upper face either with a trowel or an edger.

The manner of supporting and bracing the gang triangular mold is shown in Fig. 3. Three 2x4 joists *J* should be cut with each 4 ft. 8¾ ins. in length. Beginning at either end 3⅝ ins. should be laid off for the cleated lock piece *P*, made of a 2x4-in. board with cleats of strips 1x2x3⅝ ins. The lock piece laid under the joists, as shown, serves to bind them together. Then 1½ ins. should be marked off for the strip *U* on the end board, 3 ins. for a half brace block *b*, and afterwards 1¾-in. openings for the insertion of the hinged sideboards *S* and 6 ins. for the full brace blocks *B*, until six posts are provided for, with a half brace block, strip, etc., at the other end. The brace blocks *B* are cut from scantling 2x6 ins. They are 5½ ins. deep and are 2 ins. wide at the top and 6 ins. at the bottom, where they are nailed to the joist *J*.

The ends *E* for the molds are made from 1 x10-in. boards and are 4 ft. 1½ ins. long. They are fastened at the bottom side to the joists *J* by means of heavy, loose pin, wrought iron strap hinges, shutter hinges, or door butts *H* and at the upper side with wagon rods *W* and wing nuts *N* or with elbow catches. Until all of the molds of the gang are partially filled with concrete it is sometimes necessary to keep them from spreading open at the center by using a tie brace made from a 2-in. board with blocks 1 in. in thickness attached so as to fit the molds when the brace is in place.

Oiling the Molds.—Concrete has a tendency to stick to either steel or wood. In order to yield a smooth finish to the post, it is customary to give the inside of the molds a coating of oil. Soft soap or crude oils used sparingly serve the purpose well. Too much oil will destroy the setting qualities of the cement and will give a face roughened with pock marks. A small amount of oil, poured into a pail of water and applied with a mop or stiff broom in scrubbing out the molds after they have been used five or ten times, or as often as necessary, will prevent the concrete from sticking.

Kinds of Reinforcement.—Two kinds of reinforcement are much used—bars and wire.

Round bars 3-16 or ¼ in. in diameter are the size and kind most used in posts. The stock on hand at blacksmith shops and hardware stores is generally from steel that

Fig. 2—Sections of Mold for Triangular Posts.

stretches too easily and therefore is not the best for reinforcement. Companies which make a specialty of reinforcing materials can furnish both rods and bars which stretch only under very large loads.

The development of the wire fence has produced a material well suited for reinforcing

purposes. Of equal size, such wire will produce a stronger post than the material described above. Single No. 8 or two No. 12 wires twisted are sufficiently strong as reinforcement for ordinary line posts. In order to obtain straight wire of the necessary length the coils ordinarily placed on the market

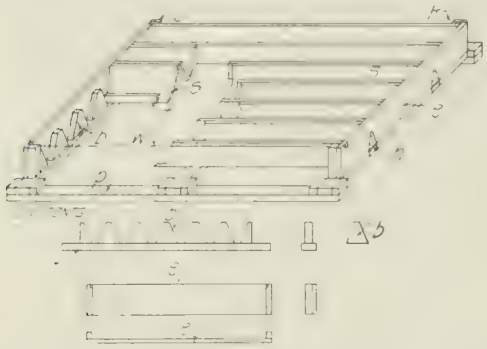

Fig. 3—Gang Mold for Triangular Posts.

should not be straightened out. Straight wire can be obtained from dealers in the same manner as baling wire—that is, either single or twisted into two or three ply cables—and of the length desired. The plain, ungalvanized fencing wire is the proper kind, for galvanization adds nothing to the strength and the metal will not rust when incased in the concrete.

Table I will be convenient in determining the size and weight of wire desired for reinforcement or for other uses:

TABLE I.—SIZES AND WEIGHTS OF WIRE FOR REINFORCING FENCE POSTS.

19	223
20	309.6

In order that the reinforcemnet may be placed and kept just where it belongs, there is in use a little device called the "fool proof spacer." It consists of a No. 10 wire, cut to such length that, when twisted once around each of the two reinforcing wires or rods, the ends will nearly touch the sides of the mold (Fig. 4). The distance from the twist to the end of the short wire is equal to the distance from the reinforcement to the side of the mold. In triangular molds such a spacer can be used only on the two rods or wires near the top of the mold. A shorter and similar device, with only one twist, may be used on the lower reinforcement. At least three spacers should be placed on each piece of reinforcement.

Spacers on No. 8 wire, which should be placed ¾ in. from the inside of the mold, should be made from the following lengths of wire for the various sizes of triangular posts:

	Heavy posts.	Medium posts	Light posts
Upper spacer	6½	6¼	5¼
Lower spacer	2	2	1⅞

Spacers on No. 8 wire for various sizes of square or nearly square posts should be made from the following lengths of wire:

	Straight posts: 5x5	Posts tapering on two sides: 4½x6, 4½x4½	Posts tapering on four sides: 5x5, 4x3
Bottom spacer	5¼	6¾	6¾
Middle spacer	5¼	6	5¾
Top spacer	5¼	5¼	4¾

For larger or smaller reinforcing a little additional length may be added or deducted. When the proper length has been determined, a number of spacers should be prepared and slipped on the reinforcing iron by way of preparation for placing it in the mold. This serves to hasten the work.

Reinforcing should be placed near the outside wall, where it is reasonable to expect that cracks will open. For reinforcement, metal slightly rusted is as good as metal that is not rusted, if not better. In placing the reinforcing rods in position it is a wise precaution to bend them back at the ends (Fig. 4). This takes only a little more time, but if it is done the reinforcement must be 2 ins. longer to allow the metal to be turned back 1 in. at each end of the post. New barbed wire should not be purchased for reinforcement, for while it costs more than plain reinforcement, the bond between it and the concrete is no stronger than between smooth wire and concrete. The danger section or the point where posts are liable to break is at the surface of the ground. For fences for lots and other places where posts may be subject to rubbing and crowding, short extra reinforcing pieces 2 ft. long are sometimes placed in the post to lap this danger section. The corner of triangular shaped posts which is not nearest the fence wire should in theory have heavier reinforcement than either of the other corners. If rods 3/16 in. in diameter, No. 8 wire, or two twisted No. 12 wires, are used in the other corners, a rod ¼ in. in diameter or two or three twisted No. 12 wires should be placed in the threatened corner.

Mixing a Six-Post Batch.—Table II gives approximate quantities for a batch of concrete sufficiently large to make six posts 7 ft. long and of the sizes named in the table. The

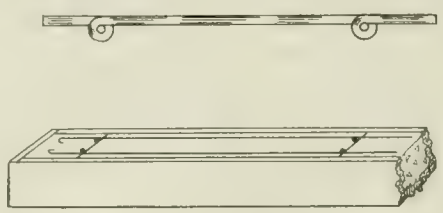

Fig. 4—Wire Spacer for Post Reinforcement.

quantities may be increased in like proportion and any desired number of posts may be made. The first of the two lines of figures given for each of the three grades, heavy, medium, and light, indicates the proportions to be used when the sand is screened from the gravel. The second line gives the proportions when "bank run" gravel is used; that is, gravel dug directly from a bank without screening the sand. In this case 1 part of cement to 4 parts of the mixture of sand and gravel should be used.

Molding.—After the molds, which as a rule lie flat, have been oiled or soaped, the concrete should be placed in them at once. If for any reason the concrete stands thirty minutes after mixing, it should be thrown away and a new batch mixed, for cement, if it has once partially set, makes weak, dangerous concrete, even though it is retempered by turning or adding water. After the molds are filled evenly to the depth of ¾ in. or 1 in., according to the spacing of the reinforcing rods or wires, the reinforcement should be laid in, properly spaced by means of at least three "fool proof" wire spacers. The concrete should then be poured in until the molds are filled within ¾ in. or 1 in. of the top, when the remaining reinforcement is fitted in place in the manner described above and the molds are completely filled. To render the concrete more compact a crow bar or a pinch bar should be placed under each corner of the mold successively and moved up and down quickly. This vibration makes the concrete more compact by shaking out the air bubbles, but there will be very few of these bubbles if the concrete is sufficiently mixed to proper consistency. If desired, the exposed corners of the post may be beveled with an "edger" and the open face given a neat finish by using a trowel immediately after the surface water has been absorbed and before the concrete has become too hard. If wooden

molds are used, they should be well soaked in water, so that the green concrete will not cause them to swell and thus crack the posts. The wind, the hot sunshine, and the frost are destructive to concrete, and while it is an easy matter to protect the post from the first two agents it is best to do no concrete work when the thermometer is below the freezing point, unless inside a building.

Curing.—It is a great mistake to believe that when the molding is done a concrete post is finished. The quality of the post must be determined by curing. The green post should be left in the mold until thoroughly hardened, that is usually for two or three days. For square or nearly square posts the molds proper may then be removed and used on another bottom board, but the posts must stay on their bottom board in the shade and must not be disturbed for at least a week or ten days. Posts in triangular molds may be carried out, each in its own mold, after from five to seven days, and the post may be gently slid from its mold to a smooth floor covered evenly with a cushion of sand. While green the strain of lifting or even a slight jar will cause cracks, sometimes invisible, which greatly weaken the post. During the first two days of the life of a post it must be kept wet and covered with canvas, burlap, carpet, or any clean material. Sand will serve after the concrete has be-

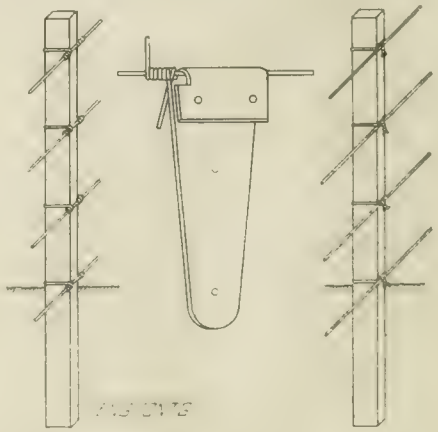

Fig. 5—Methods of Attaching Fence Wire to Concrete Posts.

come hard, but manure will stain green concrete and otherwise affect it. The sprinkling should be continued up to the eighth day. After the tenth day, if the space is needed, the post may with care be placed on end in the same manner that wooden fence rails were formerly piled. A drop of only 6 ins. often breaks a green post. The jar in hauling to the field over rough, frozen roads or in a wagon bed with a very uneven bottom has seriously

injured posts which were not well seasoned. Concrete posts gain rapidly in strength for the period of one year; they should therefore be made as long as possible before it is necessary to set them in the fence. No post should be used until it is at least 3 months old, and to meet any contingency a supply of well seasoned posts should be kept on hand.

Setting the Posts.—Experience has taught that with regard to stringers and joists, in order to get the greatest strength from the timber, one should place the beam with the narrow side against the load and with the depth extending in the same direction as the pressure. Likewise posts should be placed so that the narrow side will support the wire. The depth to which posts should be set varies with the character of the soil. Seven foot posts are usually set from 2½ ft. to 2 ft. 8 ins. deep. The earth about the post should be thoroughly compacted by tamping.

Methods of Attaching Wire.—There are numerous methods of attaching wire fencing to concrete posts. Some makers place staples or wire loops in the green concrete, others make holes in the posts. The former method is not desirable because the fastener can not be located exactly where the wire of the fencing will come when the post is set in the ground. Then too the fastener will eventually rust or break off and will thus injure the looks of the post. On the other hand, holes through the posts weaken them and therefore this method is in general unsatisfactory.

TABLE III.—COST OF MATERIALS AND LABOR AND OF THE FINISHED POSTS.

Materials.	Cost.	Number of posts.	Cost per post.
Heavy, Triangular Posts.			
1 yard of rock or gravel..	$1.60	29	$0.05½

2 men for 1 hr., at 20 cts. per hr.....	.40	5	.11
1 boy for 1 hr., at 15 cts. per hr.....	.15		
Total cost.....	...	..	$0.32¼

*Per pound.

The simplest, easiest and cheapest way of fastening a wire fence to a concrete post is by encircling the post with a wire one size less than the corresponding wire in the fence proper and by twisting this wire around the strand of the fence. This is done in two ways. The fastening wire is placed around the post, twisted upon itself and then to the fence wire, or one end of the fastening wire is twisted around the fence wire, and the free end is then carried around the post and twisted on the other side to the same wire. (Fig. 5.) The latter method is known as "the Western Union twist." Either plan is good, but care must be taken to draw the fastening wire tight or else stock trying to get through the fence may raise or crush down the fencing with their heads. If any trouble is experienced, the post should be roughened at the fastening point with a cold chisel.

Expansion and contraction of the fence due to heat and cold are cared for by the tension curves or "kinks" in the woven wire fencing, and no fear may be felt in drawing the fastening wires as tight as necessary. Wooden nailing strips should never be embedded in the posts, for moisture will swell the wood and crack the concrete.

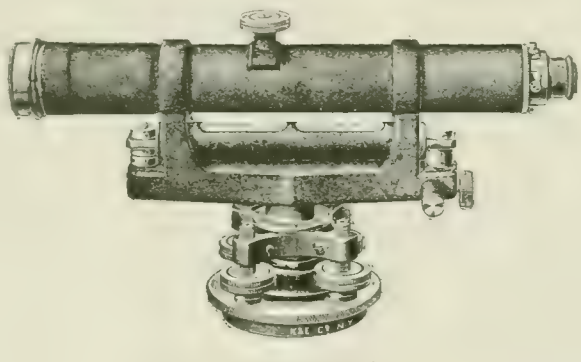
Cost of Concrete Posts.—So many elements enter into the matter of cost that no exact figure can be given. The prices of labor, molds, cement, sand, stone, gravel, reinforcement, and lumber are not the same in any two sections of the country. The cost of only two sizes of post will be considered here—Table III—the heavy, triangular and the straight, square post, each of which has a standard length of 7 ft. The figures are based on the following data: A mixture of 1 part of cement, 2 parts of sand, and 4 parts of crushed rock or screened gravel; a reinforcement consisting of two No. 12 smooth fencing wires twisted into a cable and cut to the necessary length at the factory; concrete mixed by hand; all materials delivered at the work, and all labor of men and teams paid for.

With the heavy triangular post, if considered necessary, a slightly heavier reinforcement may be used in the corner of the post away from the fence.

A New Compact Dumpy Level.

The Dumpy Level which has long been a favorite with English engineers has steadily grown in favor in this country, until at the present time there is considerable demand for such an instrument. The compactness of the Dumpy Level and its capacity to stand hard knocks and give reliable service in rough country or when carried over rough trails, accounts in a large degree for its popularity.

A Railroad Dumpy Level, recently developed and placed upon the market by Keuffel & Esser Co., New York, presents some novel features which are of interest. As shown by the accompanying illustration, this instrument is unusually compact. It is provided with a 12¼-in. telescope, very rigidly supported, and by a new arrangement of the telescope supports, a considerably longer spirit level is employed than is usually furnished with instruments of this size. The bar is made of gun metal and shaped to combine strength with light weight, while the general construction is such that the whole instrument is brought closer to the tripod plate than is ordinarily the case. The barrel of the telescope and its supports, the tube of the spirit livel and the bar are cloth finished, while the leveling arms and tripod plate are enameled.



A New Dumpy Level.

The Convention of the American Society for Testing Materials.

The thirteenth annual meeting of the American Society for Testing Materials will be opened at the Hotel Traymore, Atlantic City, on the afternoon of June 28. The programme for the first session includes the following papers: "Tests of Cast Iron Arbitration Test Bars," by C. D. Mathews; "Some Recent Tests of Cast Iron," by A. E. Outerbridge, Jr.; Notes on the Annealing of Steel Castings," by Albert Sauveur; "Untruly and Unevenly Chilled Car Wheels," by T. D. West; "The Forest Products Laboratory, Its Purpose and Work," by McGarvey Cline; reports of the committees on standard specifications for cast iron and finished castings, on standard methods of testing, and on standard specifications for hard-drawn copper wire.

The second session, on the evening of June 28, will be devoted to a consideration of the following papers: "The Closing of Blowholes in Steel Ingots," by Henry M. Howe; "Measured Strains in a Steam Boiler Under Hydrostatic Tests," by James E. Howard; "Copper-Clad Steel, Its Metallurgy and Properties," by Wirt Tassin; "Tests on Steel and Wrought-Iron Beams," by H. F. Moore; "Strength of Steel from I-Beams," by E. L. Hancock.

The third session, on the morning of June 29, is to be opened with the report of the committee on standard specifications for steel. Afterward the following papers will be presented: "Low-Carbon Streaks in Open-Hearth Rails," by M. H. Wickhorst; "Elongation and Ductility Tests in Rail Sections Under the Manufacturers' Standard Drop-Testing Machine," by P. H. Dudley; "The Influence of Titanium on Segregation in Bessemer Rail Steel," by G. B. Waterhouse; "Cupro-Nickel Steel," by G. H. Clamer; "Test of a Structural Steel Plate Partly Fused by Short-Circuited Electric Current," by A. W. Carpenter; "Further Notes on the Heat Treatment of Steel," by Wm. Campbell; report of the committee on standard specifications for cold-drawn steel.

The fourth session, on the evening of June 29, at which a very large attendance is assured, will be devoted to addresses in honor of the memory of Dr. Charles B. Dudley. Theodore N. Ely will speak of him as a railroad man, Edgar F. Smith as a chemist, Henry M. Howe as a metallurgist, Col. B. W. Dunn as a mentor, W. H. Schwartz as a citizen, and Capt. R. W. Hunt will pay a personal tribute as a lifelong friend.

The fifth session, on the morning of June 30, will be opened with a report of the committee on standard specifications for cement, which will be succeeded by a discussion of the following papers: "Aluminates, Their Properties and Possibilities in Cement Manufacture," by Henry S. Spackman; "The Effect of Sodium Silicate Mixed With or Applied to Concrete," by Albert Moyer; "Comparative Tests of Lime, Hydrated Lime, Lump Lime, and Cement Lime Mortars," by E. W. Lazell; "Tests of Reinforced Concrete Columns Subjected to Repeated and Eccentric Loads," by M. O. Withey; "The Distribution of Stress in Reinforced Concrete Beams," by A. T. Goldbeck; "A Sand Specification and Its Specific Application," by W. A. Aiken.

The sixth session, on the afternoon of June 30, will be devoted to a discussion of the reports of the committees on preservative coatings for structural materials, on the corrosion of iron and steel, on standard tests for lubricants, and on standard methods of analysis of fats and oils, and the following papers: "A Method for Testing the Protective Power of Paints When Applied to Iron and Steel," by the late M. T. Jones, Jr., and W. H. Walker; "Another Solubility Test on Protective Coatings," by G. W. Thompson; "Vermilion Paint for Railway Signals," by Robert Job; "The Painting of Cement and Concrete Structures," by Charles MacNicol, and "Classification of Fine Particles According to Size," by G. W. Thompson.

The seventh session, on the morning of July 1, will be devoted entirely to testing machines and apparatus, and there will be a special exhibit of photographs and drawings of such equipment in the testing laboratory of the University of Wisconsin. The list of papers for this session is as follows: "The 600,000-lb. Testing Machine of the University of Wisconsin," by H. F. Moore and M. O.

(Continued on page 576.)

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Structural Details of Two Earth Dams for the Porto Rico Irrigation Service.

The accompanying illustrations show two earth dam sections developed by the Porto Rico Irrigation Service, B. M. Hall, Chief Engineer. The larger dam shown by Fig. 1 is known as the Carite Dam and is located near Guayama; the other is the Toro Negro Dam located near Villaba. In our issue of Jan. 19, 1910, details were given of a still larger earth fill dam for the same service.

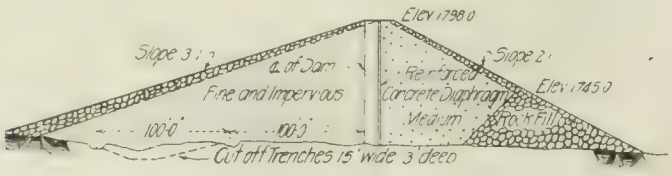


Fig. 1—Eearth Dam at Guayama, Porto Rico Irrigation Service.

The Carite Dam work calls for 150,000 cu. m. (196,200 cu. yds.) of earth and loose rock excavation. Figure 1 shows the maximum cross-section. This dam has a reinforced concrete diaphragm or cut-off wall extending straight across the dam and two cut-off trenches on lines of, roughly, equal depth of embankment. The concrete diaphragm is about 100 ft. high at the deepest point of the dam and is 4 ins. thick and is the unique feature of the work. For this wall the engineer will specify the proportions according to the materials to the end of securing a dense concrete. The sand used is required to be a well graded mixture all passing a ¼-in. screen and the coarser aggregate is also to be graded—artificially if necessary—and must all pass a ¾-in. screen and be all retained on a ¼-in. screen. In proportioning, the volume of a barrel of cement will be assumed as being 4 cu. ft. A wet mixture is required wherever practicable and in placing it is to be well worked to reduce voids and the faces next the forms spaded to bring the fine material to the surface.

The cut-off trenches will be 3 ft. deep and 10 ft. wide and are to be filled with a mixture of at least 45 per cent clay and sand and gravel, with no stones larger than 4 ins. The backfilling is to be wetted and deposited in 6-in. layers and each layer compacted by a roll weighing not less than 100 lbs. per lin. in. of tread. These requirements also apply to the cut-off trench work for the Toro Negro Dam shown in section by Fig. 2.

Generally for both dams the embankment is to be made from materials excavated from the spillways, etc. The specifications for embankment are as follows:

Proportioning the Materials.—The materials entering the dams shall be distributed approximately as shown on drawings Nos. 3 and 5. The bulk of the material will come from the spillway excavations, the rock from which will be deposited on the outer slopes. The central portion shall be composed of the finer material from spillways and borrow areas, and shall contain not less than 25 per cent and not more than 35 per cent of clay, the remainder being sand and gravel or small rock particles.

Formation of Embankments.—The dams shall conform to the slopes and dimensions shown on the drawings, and shall be built up in successive horizontal layers of not more than 6 ins. thickness. Each layer shall be thoroughly rolled and compacted, except in the rock portions. The rollers shall weigh not less than 1 ton per lin. ft. of tread and shall be composed of alternate large and small discs, whose difference in diameter shall be not less than 2 ins. and whose width shall not be more than 12 ins. A roller made of concrete will be acceptable. When necessary each layer shall be sprinkled before rolling with sufficient water to secure the greatest practicable compactness. All rock larger than 4 ins. in diameter shall be removed from the central portion into the rock portion of the dam. To effect the proper mixture for the central portion the loads from different parts of the excavation shall be deposited in such sequence and at such places as the engineer may direct and the method of spreading shall be subject to the approval of the engineer. In so far as it may be practically effected in the regular handling of the material small and large rock will be mixed to the end that large cavities may be avoided in the rock masses on either slope, but a sufficient quantity of finer material must be incorporated with the boulders in the upstream slope to practically fill the voids. All the material in the dams must be firmly bedded, and form embankments of unyielding stability.

As will be seen from the drawings it is intended that the upstream half, or that part of the dam on the upstream side of the central diaphragm shall be made as nearly impervious as is possible from the materials designated, and that puddle trenches as shown in drawing shall cut off the percolation along the bed rock or other natural formation, thus connecting the dam with the impervious formation underlying it; that part of the dam on the downstream side of the central diaphragm shall be of more porous material, the finest part of which is near said diaphragm and the most porous part of which is at the edge of the downstream rock covering, with a gradual grading between these two points as to imperviousness.

Steam Shovel for Basement Excavation.

In excavating the basement for a twelve story building on the corner of Michigan Ave. and Peck Court, Chicago, a steam shovel is being used. This shovel is making excellent progress and will take out the required amount of about 17,000 cu. yds. in the 40 working days allowed. This cut is about 134 ft. x 241 ft. and will be about 14 ft. deep.

The shovel used is a Thew shovel of 15 tons weight and it is equipped with a ⅝ cu. yd. bucket. This type of shovel makes a complete swing and can reach all material within a radius of about 15 ft. The machine rests on four wheels with wide tires, and in soft ground heavy planking is used to support it. One of the features of the machinery is the forward horizontal motion of the dipper. This motion is particularly useful in skimming off a shallow layer of material where necessary.

In starting the work the shovel dug its own pit and is now working the excavation back in parallel cuts from one side to the other. A runway has been placed so that all teams come in and pass the shovel, taking their loads, and, making a swing, pass out up the same runway. A three-horse snatch team is used for helping the loaded wagons up the runway.

An engineer and fireman are on the machine and besides these men there are only two pit men who place the planking upon which the shovel advances. The shovel is supposed to be of about 400 cu. yds. capacity per day but has often exceeded this on short runs. It has loaded 31 two-cu. yd. wagons on this work in 30 minutes. The average amount for the entire job will be about 400 cu. yds. per day of 10 hours.

The material is taken by dump wagons to the disposal station about ¾ of a mile away where it is dumped into barges to be towed out into the lake. The building which will be erected at this point is owned by S. Karpen Bros. The erection of this building is let to the Thompson-Starret Co. and the excavation work is under contract to Wm. J. Newman, of Chicago.

General Methods of Constructing the Louisville Sewers With Some Data on Costs.

The general plans of the new $4,000,000 sewer system at Louisville, Ky., were described in our issue of June 8 and in the following issue of June 15 we illustrated and described the main structural features of the work. We continue the account of this important work with a description in this issue of the general methods of construction and a presentation of a number of cost data. Articles to follow will give methods and costs of doing certain individual pieces of work.

When Louisville began sewer construction in 1908 the contractor had considerable difficulty on account of lack of laborers experienced in that class of work. Practically no sewer work had been done in that city for 20 years and as a result the contractors were compelled to train unskilled men. Today conditions are much better, a large number of Louisville laborers are trained in the work. Labor conditions are not ideal, however. Most of the common labor consists of negroes. It is often difficult to get them out on Monday morning.

When the work was first started, contract prices were low; the country had not yet recovered from the panic of 1907, and men were sometimes glad to bid on jobs wherever they could use their idle machinery. Consequently, no fortunes were made on the work. Since that time, however, conditions have gradually improved and contractors are now making a fair profit.

Some complaint has been made by several contractors on account of the time required for leaving the arch forms in place. It was held that this was one of the greatest difficulties of the work. On large sewers, 7 days were required for the concrete to set before the forms could be removed, and the next operation could be performed. This length of time

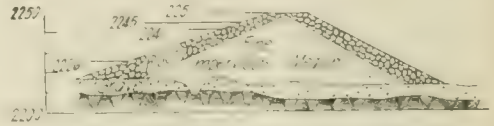

Fig. 2—Earth Dam at Villaba, Porto Rico Irrigation Service.

made it necessary for the contractors to have a very much longer ditch open than they desired, and increased the cost on all items.

General Methods.—In general the sewers are constructed in open cut. The largest sewers happen to be very deep and the cut is as deep, in places, as 50 ft. Most of the work in the city is to some extent in sand and gravel although there are places where small sewers have been built entirely in clay and very little sheeting or bracing was necessary. In the construction of the large bulk of the work, however, tight sheeting has been necessary. Where the work has been in paved streets the sheeting has been a real problem on account of much trouble due to the settlement

of the pavements, curbs, sidewalks and buildings.

In Louisville, pine lumber costs $2 or $3 more than hardwood lumber. Both kinds are used for sheeting the trenches, but pine is universally used for braces. Two inch stuff is used for sheeting, but with hardwood, 2 in. stuff means anywhere from 1½ ins. to 3 ins. in thickness. The hardwood is usually purchased in various widths for sheeting purposes as it comes a little cheaper that way. In the opinion of some, this uneveness in the sheeting is somewhat responsible for the settling of the pavements and for that reason they believe money is saved by using pine. On the other hand the hardwood is used, especially where streets are not improved, because it can be used six times where pine is used three times.

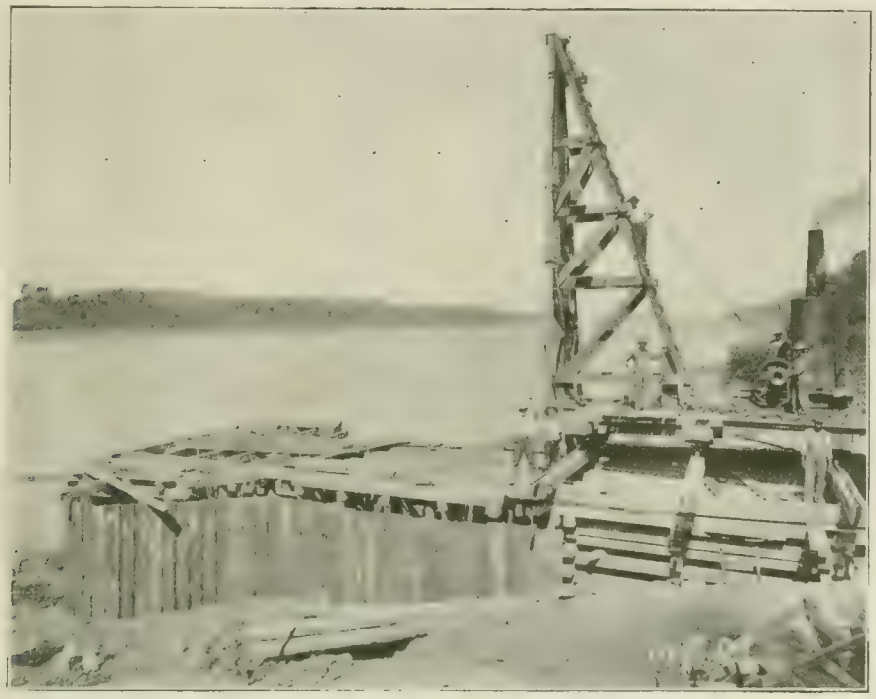

Fig. 1—Cofferdam at Outlet Structure of Southern Outfall Sewer.

In places the sand is so fine that it will sift through the cracks in the sheeting, enough to cause a settlement of the pavement. It was necessary, in such cases, to tamp sand and dirt into the space left, after pulling each piece of sheeting. In cases where large buildings were adjacent to sewers built in sand of this sort, the trenches were double sheeted and the sheeting left in place.

Types of Plant.—The popular machine in use on the heavier work is the stiff leg derrick. It is used in its various forms. Many are fitted with orange peel buckets, and nearly as many with clam shells. The derricks are used for excavation where it is desired to spoil alongside the trench, or into wagons or cars. Next, in number to the stiff leg derricks are locomotive cranes. These answer the same purposes as the derricks, and have the additional advantage of being able to move rapidly on tracks.

Several machines are used with the object of carrying the excavation immediately from the point of excavation to the back fill. These are cableways and Potter, and Carson trench machines. All carry buckets which are filled by hand. Cableways handle one large bucket and are also used to pull sheeting. The Potter machine carries two buckets, suspended by cables from a carriage which runs on a track on top of a frame made of steel trusses which straddle the trench. The trusses are supported on wheels which run on a track and the machine can be moved ahead as the excavation proceeds. The Carson machine works on the same principle as the Potter machine. It carries, however, six buckets of small size which are all raised and lowered as one unit. Some of these machines have two runways on them and operate two sets of buckets, one set being filled while the other is being dumped. These machines work very satisfactorily for excavation where the material is to be used immediately for backfill. If the work is at such a stage that no backfilling can be done, the machine must stand idle. The most satisfactory arrangement has been proved to be to use them for only a part of the excavation on big work. The point where most trouble is experienced, however, is in not having a long enough machine to cover the work desired to be kept open.

Cableways have been used on work for excavating and carrying the material immediately to the backfill. On large work, derricks operating clamshell or orange-peel buckets are usually employed to spoil all material along side of the trench which is not carried by the cableway to the backfill. An ideal cableway job, in sewer work, presented itself in the case of the Beargrass Intercepter where it lay in a narrow strip of land between the railroad tracks and the creek. South of Baxter Ave. for a distance of 1,100 ft. the work was difficult of access and much of the material was handled economically by the cableway.

Construction of Outlet Structures.—There were four outlet structures built into the Ohio River at Louisville. Three of these, the 34th St., the Northwestern and the Southern Outfall outlets, were below the falls and one, the Beargrass Intercepter, was built above the falls. The 34th St. outlet was built to replace an old structure. It was built farther out into the stream and at a small offset from the old sewer. It is of reinforced concrete, horseshoe shaped section, 7 ft. in diameter, and is lined with brick to the springing line of the arch. A portion of the lower end was carried down to bed rock and the concrete foundation was keyed into the rock to prevent any movement.

The outlet structure was built within a cofferdam which was made of two sets of 2-in. tongued and grooved sheeting, set 2 ft. apart and driven into the river-bed. A clay filling was put between the two sets of sheeting. Inside the cofferdam a single set of sheeting was driven to the ledge of rock as fast as the excavation progressed. Excavation was carried on by the use of an orange peel bucket operated by a stiff leg derrick, and also by hand. A 6-in. belt-driven Lawrence centrifugal pump and a 3-in. pulsometer were used for keeping the water out of the excavation.

The outlet structure at the Northwestern sewer is very similar in design to that at 34th St., but the foundations are somewhat more elaborate. In addition to the concrete base carried to rock, and the concrete piles used at the 34th St. outlet, the structure at the Northwestern outlet is supported for some distance on caisson foundations carried to rock. These caissons were composed of steel cylinders 5 ft. in diameter and in 4 and 5-ft. lengths. The bottom section was provided with a reinforcing band at the lower end. At the other end, and on each of the other sections, the cylinders were provided with flanges by which they were bolted together. In order to make tight joints, rubber gaskets were used, with the aid of oakum when necessary. One section was set in its proper position and the material excavated from within by hand and as fast as necessary succeeding sections were bolted on. Usually the weight of the steel was enough to force the caisson into the ground, but at times the movement was aided by hammering or by jacks which reacted upon the timbering of the trench. The ground water within the caissons was pumped out by small Nye pumps, which were lowered into the caissons. But little ground water was found, as the materials through which the caissons were driven was largely impervious, being strata of fine silt, clay and cemented clips of slate rock.

The plant installed upon this work included a 50 hp. boiler, which supplied steam for three Nye pumps and a Chicago Improved cube concrete mixer. The derrick was operated by a Ledgerwood hoisting engine.

In beginning the construction of all the outlet structures the contractor assumed that the water to be fought came from the river, but during the construction at the Southern Outfall it was demonstrated that the ground water coming from the shore was a source of more trouble than the river itself. The only difficulty experienced from the water of the river was during the season of high water. At high water the river rises sometimes 40 to 50 ft. and, of course, closes down all operations.

Fig 2.—Looking Toward Bank of River from Fig. 1, Showing Clay Cut.

On the Southern Outfall the outlet structure was enclosed in a cofferdam built of United States steel sheet piling driven to rock. When these piles were being driven, water from beneath flowed up from the lower strata in the spaces between the tongues and grooves of the piles, and overflowed at the top ends of the

piles. This indicated that the ground water beneath the river, at these points was under a head at least 15 ft. greater than river level. The accompanying views, Figs. 1 and 2, show the cofferdam at the outlet structure, the piledriver, and a view of the excavation looking toward the bank. The casings of some of the simplex concrete piles used, are also shown in Fig. 2. An idea of the elevation of the Ohio River in times of high water may be had by referring to this picture. The water during the winter of 1908-9 reached the foot of the stairway to be seen on the left.

Fig. 3—Pile Driver on a Portable Turntable for Driving Piles in Sewer Trench.

The concrete work on all the outlet structures was built in three operations, the invert and sidewalls being placed first, then the brick lining, and finally the arch constructed. Wooden forms were used.

Tunnel Work.—On several pieces of the sewer work tunneling has been resorted to in order to avoid deep cuts and closing of streets. The excavated material from the tunnels was generally handled in cars on narrow gage tracks. At the shafts the material was elevated by derricks. The timbering consisted of bents placed 5 ft. apart with 2 in. sheeting for roof and side walls. The bents were made of 8x8-in. posts and 10x10-in. caps. In places where the floor of the tunnel was quite soft the weight of the surrounding material forced the bottom upward. In such cases oak plank was placed as a base to build the concrete sewer upon.

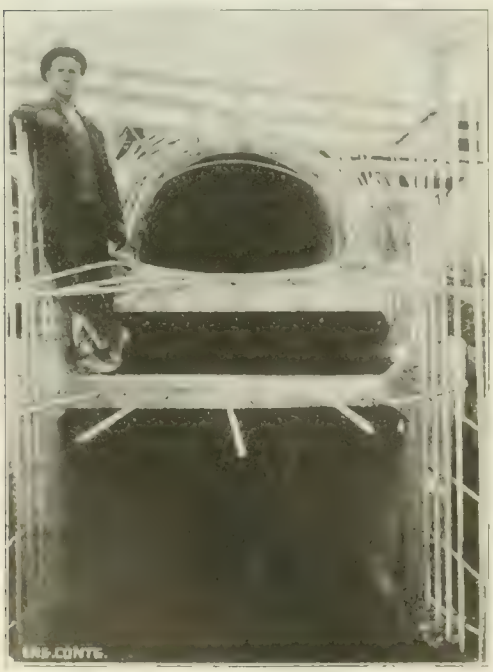

Fig. 4—Section of Concrete Sewer and Drain—A Separate System on One Pile Foundation.

A portion of the Beargrass Intercepter which was built in tunnel, was built upon concrete pile foundations. The holes for these piles were bored with an auger, making a finished hole 10 ins. in diameter. The material encountered was a fill of clay and muck. All holes were carried to gravel. Frequently the borings struck logs in the fill delaying the progress of the work materially. Vertical steel reinforcement was placed in each hole and the hole then filled with concrete. In a portion of the work where water rose in the holes, it was pumped as low as practicable and the concrete was deposited through a galvanized iron casing, the casing being withdrawn as the concrete filled the hole. In another portion of this work, the material encountered was so wet and mucky that the holes would slough in before concrete could be placed, which was prevented by the use of 12-in. wrought iron pipe casings. This pipe was used in sections 3 ft. in length, and, as conditions required, one or more lengths were placed in the holes. When these large piles were used, the number of piles in a bent was changed from three to two and if the casing extended the full depth of the hole, the steel reinforcement was omitted. The average length of the concrete piles was 11 ft.

The average rate of progress of tunneling in soft material was 4⅜ ft. in eight hours. The average amount of material was 3 cu. yds. per lin. ft. The average progress of concreting amount to 3.6 cu. yds. of concrete placed in 8 hours.

Piledriving.—On Section A, Northeastern system, the ground is low and the sewer is located adjacent to the old creek bed. The construction here involved a pile foundation and the driver used is shown by Fig. 3. The driver and the donkey engine which operate it are mounted on a platform which is in turn mounted upon a portable turntable. The weight of the machine is supported a safe distance from the trench.

The oak piles, averaging 15 ft. in length, were driven by a Vulcan Steam hammer weighing 3,000 lbs., with a 36-in. stroke, the gross weight of the hammer being 6,800 lbs. The piles were driven to a penetration of from 0.1 in. to 0.2 in. per blow and even when the penetration was as little as 1 in. per ten blows, the heads of the piles were not materially broomed. This machine drove 40 to 50 piles in a day of 10 hours. Fifty to eighty blows are required in driving a pile through this clay to solid position in gravel. After being driven, the piles were cut off at an elevation about 3 ins. above sub-grade, when the reinforcing steel and the concrete of the sewer were placed upon them. The piledriver crew consisted as follows:

1 captain.
1 engineer.
1 fireman.
2 men in lead.
3 men handling piles.
2 laborers trimming piles.
2 laborers for miscellaneous work.

The concrete work on this sewer was somewhat complicated owing to its section, which is shown in Fig. 4. A portion of the completed sewer showing the "jackets" or outside forms, is shown by Fig. 5. The concrete was mixed by a stationary Ransome mixer and was carried to the work in cars run on a portable track. The method of charging the mixer has varied according to its location. When near the Cut-off Embankment, it was placed at such an elevation that the materials could be drawn from hoppers onto a loading platform, from which they were delivered to the mixer. At Ohio St. the conditions not being as favorable for handling materials by gravity, the sand and gravel were brought to the mixer in wheelbarrows.

The structure was built in four operations, the invert of the drain being built first, after which the side walls and top of the drain were constructed. Following the completion of the drain, the side walls of the air chamber between the sewer and the drain and the invert of the sewer were built as the third operation, after the completion of which the concrete was placed in the arch of the sewer.

Fig. 5—Completed Sewer of Fig. 4, Showing Cutside Forms.

The invert of the drain was placed in long sections, steel templets being imbedded in the fresh concrete at the correct elevation about nine feet apart. The invert was finished by screeding to these temporary steel templets and floating with hand trowels. Soon after the finishing of the invert, the steel templets, which were about 2½ ins. by ¼ in. in cross-section, were withdrawn and the narrow spaces left in the invert were filled with mortar and properly smoothed. The trowel finishing of the invert was performed by finishers, who stood in the fresh concrete after it has been screeded, moving backward as the finished surface in front of them was completed. After the invert of the drain had acquired sufficient hardness to permit of walking upon it, the forms for the side walls and roof of the drain were placed in position and filled with concrete.

When this concrete had become set, the forms for the side walls of the air chamber between the drain and the sewer and the forms supporting the invert of the sewer (which is the top of the air chamber) were

placed in position and filled with concrete. The invert of the sewer was finished by screeding and floating in the manner already described in connection with the finishing of the invert of the drain. As soon as the invert of the sewer had acquired hard set, the centers were set and the concrete of the arch was placed.

All forms used upon this work, except the centers for the sewer arch, have been built of wood. The forms for the arch of the sewer were the Blaw steel centers.

The transverse reinforcement consisted of bars laid in the invert and roof of the drain and in the invert and arch of the sewer and in the vertical side walls. The side wall bars were in one piece, extending from the invert of the drain to the springing line of the sewer.

From a point about 50 ft. west of the Cut-off Embankment, the sewer curves toward the south, thus leaving the drain upon which it is supported farther west. The elevation of the drain is such that the tops of the wooden piles supporting it are below the surface of ground water at all times. The sewer, however, after it leaves the drain near the Cut-off Embankment, is at an elevation considerably above the level of ground water. It was at first intended to support this structure by cast concrete piles. Trial piles which were made did not prove satisfactory and as a substitute wooden piles were driven and cut off below the normal elevation of the ground water. Upon these piles were built transverse concrete piers 24 ins. wide and 50 ins. c. to c., extending up to the underside of the sewer invert. The sewer was then built upon this timber and concrete pier foundation. The cost to the Commission of this foundation, including both piles and piers, was about the same as the price bid for a cast concrete pile foundation.

The contractor for the construction of this work, Section A, was the Blackstaff Engineering Co. of Philadelphia, Pa. The work was carried on under direction of Mr. W. Mayo Venable, superintendent for the Company.

The cost of various operations in the work throughout Louisville are shown in the following tables.

Lining a Concrete Sewer With Brick.—This sewer was of concrete, horseshoe section and about 4 ft. in diameter. The brick lining of the invert and side walls contained 8.3 sq. yds. in 65 ft. of its length. The brick were laid on edge and 8½ bbls. of cement were used in the mortar:

6 bricklayers at 62½c hr., 3½ hrs.	$13.12½
6 helpers at 20c hr., 3½ hrs.	4.20
Cost of laying 8.3 sq. yds.	$17.32½
Cost of laying 1 sq. yd. brick lining	$2.087

Potter Machine on Trench 15 ft. Wide 21 ft. deep:

7 men excavating (sand) at $1.75 per day	$12.25
1 engineer at $3.50 per day	3.50
1 fireman at $2.00 per day	3.50
Rental of machine $200 per mo. at $8.00 per day	8.00
Av. output per day 150 cu. yds.	$27.25
Cost per cu. yd. 18c.	

Mixing and Placing Concrete by Hand.—Material had to be hauled 300 ft. in wheelbarrows, and was mixed by hand on platforms over the trench. It was poured through chutes to place. The average wages of these men were 22½ cts. per hour. The concrete men are paid more than the ordinary laborers who receive 17½ cts. per hour:

6 men turning	$10.80
2 men mixing mortar	3.60
5 men wheeling	4.00
1 man on water and cement	1.80
2 men handling chutes	.60
1 men spading	.20
20 men placing 30 cu. yds. at	$20.00

This gives a cost of $1.20 per cu. yd. for labor of placing concrete.

Knocking Down the Blaw arch forms, wooden jacket and invert forms for this sewer, moving them ahead and setting them up required 8 hours for 3 men. One man acted as foreman with two helpers. It required 4 hours to set the invert forms, 2 hours to set the jackets for the walls, and 2 hours to set the Blaw arch forms. This is for a 5 ft. sewer.

Placing the reinforcing steel required the time of the above mentioned squad of 3 men. They set the steel for the invert and sidewalls in 5 hours and for the arch in 1½ hours. The foreman was paid 25 cts. an hour and the helpers 17½ cts. There were 53 lbs. of reinforcing steel per running foot. Striking and settling Blaw forms for 60 lin. ft. of horseshoe shaped sewer, 5 foot section:

1 foreman, 8 hrs. at 25c	$ 2.00
2 helpers, 8 hrs. at $17½	2.80
Total	$4.80

Striking and settling 60 ft. of forms, cost at ½ cu. yd. per lin. ft., per cu. yd., $0.16.

Placing reinforcement for 60 lin. ft. of sewer:

1 foreman, 7½ hrs. at 25c	1.875
2 helpers, 7½ hrs. at 17½c	1.3125
Total	$3.18¾

Placing reinforcement for 60 ft. of sewer at ½ yd. per lin. ft., cost $0.106 per cu. yd., and at 53 lbs. per lin. ft., $0.002 per lb.

A summary of the cost of labor per cubic yard in constructing 60 lin. ft. of 5-ft. sewer was:

Cost per cu. yd. mixing and placing concrete	$1.20
Cost per cu. yd. striking and erecting blank forms	.16
Cost per cu. yd. placing reinforcement	.106
Total cost of labor per cu. yd.	$1.466

The work described in the above article is under supervision of the Commissioners of Sewerage of Louisville. Mr. J. B. F. Breed is Chief Engineer and Mr. Harrison P. Eddy, Consulting Engineer.

Methods of Building the Foundations for a Twenty-Story Building in the Down-Town District of Chicago.

At present there are about a dozen buildings, from 16 to 20 stories above ground, in course of construction within an area of a mile square in the downtown or business district of Chicago. Among these is the 20-story Harris Trust Building which is being erected on the site of the old building of the same name. The construction is made difficult by the limited amount of room for storage of material, by the many engineering features involved in the construction of the building itself and in the protection of the adjacent buildings. The Harris Trust Building faces north on Monroe St. and has a frontage of 90 ft. 8½ ins. on that street. It extends from the street line 189 ft. 1 in. back to the alley line. The street and alley must be kept open to traffic at all times.

The new building will rest on caissons extending to bed rock and the sub-basement will be about 44 ft. below the level of the street. The walls of the building will be carried down to this depth and in some places will be 56 ft. deep. This depth of wall will be on the alley line and is so deep to make space below the boiler room floor level for the entrance of a branch tunnel from the Illinois Tunnel. This tunnel will be used for the cars which will carry the ashes and waste from the building. The wall in the alley will be 3 ft. thick for its entire height and will be reinforced with 20-in. I-beams weighing 100 lbs. per ft. and placed vertically 3 ft. on centers. Walls with battered faces will be reinforced with square steel bars.

Consideration was taken, in designing the walls, of the heavy buildings adjacent. On the west side is the 6-story Central Trust Building with a heavy brick wall extending the entire length and on the east is the Fort Dearborn Building which is 16 stories high for a distance of 60 ft. back from the street and has additions, extending back to the alley, which are only 4 stories in height. All these adjacent buildings rest on raft foundations and precautions must be taken to prevent any settlement in their walls while carrying the foundations down for the new building. Opposite the 16-story part of the Fort Dearborn Building the foundation wall for the Harris Trust Building is kept away about 15 ft. This will allow room for shoring up that building. A sketch showing the manner of shoring the 16-story part of Fort Dearborn Building is shown by Fig. 2.

The sequence of operations in the excavation and construction of the basement and foundations is as follows: (1) The entire area of the old basement is excavated to about 12 ft. below the street; (2) A heavy timber platform is built over the area for handling the spoil from the caisson excavation; (3) After the first row of caissons is excavated they are concreted, the concrete work being carried on underneath the platform while the excavation continues to be handled from above; (4) Platform is removed and steel work started from the caissons up; (5) Excavation for the building walls is carried down as the steel work goes up; (6) Concreting walls; (7) Excavation of remaining part of basement. During the first and second operations the walls of the adjoining buildings are shored and taken care of. In describing the work the above order will be adhered to.

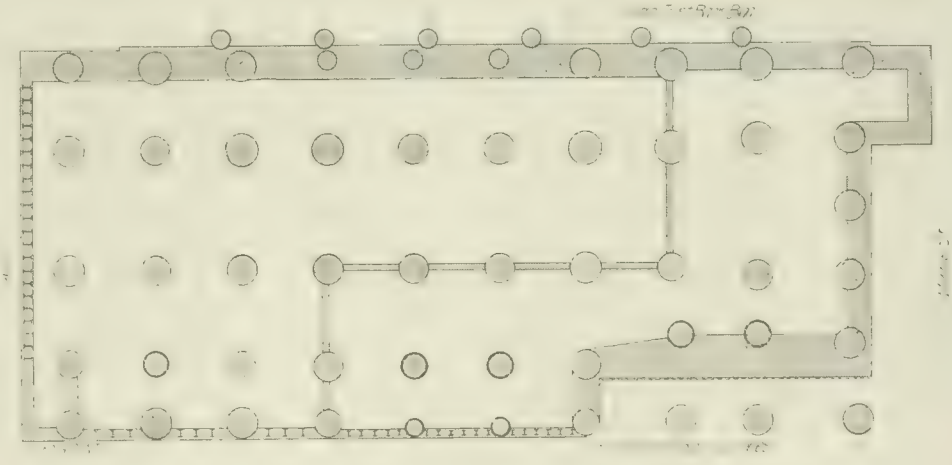

Fig. 1—General plan Showing Location of Caissons and Walls.

After removal of the old building a runway was built into the old basement and wagons drove in and out upon it. The entire area was made 4 or 5 ft. deeper than the former basement, and the old stone foundations were broken up by hand and removed. The excavation was all done by hand and was carried on in such a manner that the west part was finished first. A heavy timber platform was then started, and was built along the west part following the completion of this preliminary excavation. The platform is built of old timber and is of heavy construction being framed with 12x12-in. timbers and having a 3-in. plank floor laid on 2x12 in. joists placed about 1 ft. apart. With this platform the space for working is doubled, and teams may drive over it from the street and out at the alley, or vice versa. The caisson centers are located on the platform and holes are left at these points through which all the spoil from the caissons is handled. Over each of these holes a "head house" is erected. This is merely a raised scaffold about 7 ft. high.

Upon it is a tripod and a sheave and rope for raising the buckets. A wagon is left standing alongside each head house on the platform and when filled, a team hooks on and hauls it away, and another wagon is placed there. The caissons are worked by rows and four men are required at each one, two men on the "head house" and two men below. An arrangement for raising the buckets by steam power is made. On each tripod is a sheave attached to a nigger head. The sheaves of all the tripods, in a row of caissons, are placed in line, so that a continuous cable, running round a drum on a donkey engine at the end of the row, operates all the nigger-heads in that row and is kept going continuously. In raising the buckets all that is required is a turn or two of the rope, around the nigger head. In the same way one donkey engine can be arranged to handle the material from two or three rows of caissons by so arranging the cable as to pass over all sheaves. The caissons are carried down to bed rock which is in the neighborhood of 100 ft. below the street. The progress per 8 hour shift in this excavation is from 8 to 13 ft. in the stiff and soft clay and in the hardpan sometimes less than 1 ft. depending upon the hardness of the material encountered.

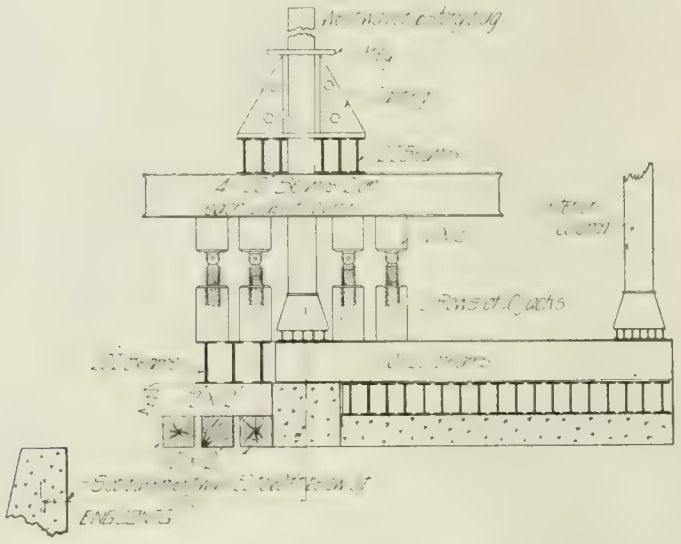

Fig. 2—Showing Arrangement of Grillage and Jacks for Shoring Up Wall of the 10-Story Fort Dearborn Building.

During the above operations of excavating the area, and of excavating the caissons, the walls of the adjacent buildings are shored. In the case of the Central Trust Building on the west, the brick wall is bored through opposite each column and is tied to the column by a bolt and a heavy iron plate placed on the outside of the wall. All along the wall a few feet from its base, holes several feet wide are made and screw jacks are inserted. The jacks are put in as close together as they can be placed. This is about 1 ft. apart. After the holes are filled with these jacks the balance of the wall is cut away for more jacks until the whole wall rests entirely upon them. Any settlement of the wall, then, is taken up on these jacks.

The brick walls on the east side which constitute part of the addition to the Fort Dearborn Building are taken care of in the same way. The 16-story part, however, rests on steel columns, which in turn rest on raft foundations, and this part is treated differently. Figure 2 shows the method of holding up this wall. It will be noted by the sketch that these outside columns of the Fort Dearborn Building rest on the 20-in. I-beams which are carried over from the interior columns. These rest on a grillage of 12-in. I-beams, and all are imbedded in concrete. This is a type of the cantilever foundation. With this kind of foundation it is possible to do considerable excavation close to the outside footings without causing a settlement in the columns of the outside wall. In this case, however, a wall 8 ft. wide at the bottom and extending about 30 ft. below these footings is to be excavated and extra precautions are taken. The wall for the new building is, at this point, located about 15 ft. away from the old building. This gives space for some cribbing on the outside of the old building. The steel columns are notched on both sides and keys 2 ins. square are placed in the notches. A casting is made, which fits around the steel column and is bolted to it. Under the shoulders, as it were, of this casting a cribbing is formed as shown in the sketch, half the weight taken up on the raft foundation and half carried down onto the ground on the outside. Any settlement will be taken up by the jacks.

While the first row of caissons is being finished the platform is built for the succeeding work. The concreting plant is started as soon as the first caissons are ready. This work is all carried on under the platform. The entire area under the platform is covered with "made up" runways. These consist of sections 16 ft. long and 4 ft. wide, which are laid side by side on the clay, or on mudsills, and which make a good floor, on which to wheel concrete. The sections are made of 1-in. material. A McKelvey mixer of 1 cu. yd. capacity is used and is operated with a 25-hp. motor. The mixer is fitted with an elevating charging hopper. All the material for concrete is dumped from wagons through the platform. About 12 men are required to feed the mixer, which is done with wheelbarrows; 6 men are used on the stone, 3 on sand, 2 on cement, 1 man tending the hopper, opening and dumping cement bags, etc., and 1 man wheeling them and receiving them from the wagons down the chute.

Inasmuch as all the material is dumped through the platform above at least four of these men could be dispensed with on the stone and sand, if bins were built so that the wheelbarrows could be loaded from them without shoveling. One operator is required to operate the loading hopper and to dump the mixer. Two-wheeled carts are used for taking the concrete from the mixer. From 4 to 6 of these carts are used according to the length of haul. Three extra men are required to help push the carts on grades and to help dump the carts into the caissons. The rate of concreting is about 20 cu. yds. per hour. It may be mentioned here that part of the lagging used for bracing the excavated caissons will eventually be saved when the excavation for the sub-basement is carried down. The steel rings, used to brace the lagging, are taken out as the concreting proceeds, and two men are kept busy taking these rings out of the different caissons, and tamping the concrete, keeping each caisson ready to receive concrete as fast as the space is needed by the concrete gang.

When the caissons are concreted the work of removing the platform begins and the erecting of the steel work, which rests directly on the caissons, is commenced. Simultaneously with this work the excavation for the side walls of the building begins. These walls will be excavated 3 ft. in depth at a time the deepest parts to be about 44 ft. below the street level. After each 3 ft. of excavation 3x12 in. planks will be placed horizontally and braced with "false sets" or, one might say, short sets of bracing, which will later be replaced by longer timbers. The excavated material from these walls will be disposed of through the Illinois freight tunnel, which runs adjacent to the work.

When the basement walls are completed the area included between them will be excavated and carried down to the required depth. This depth will be sufficient for three floors below the street. The lower one will be for the heating plant and coal storage.

By the time the basement is completed the structural steel work will be several stories high and will have provided sufficient room to carry on the balance of the work without so much trouble from the lack of space that is always experienced in the foundation work.

For the use of plans, we acknowledge our indebtedness to the architects, Shepley, Rutan & Coolidge, and also to the engineers in charge of the construction of the foundations, E. C. & R. M. Shankland. The General Contractors for the construction of the building are Wells Bros. & Co., of Chicago. The work of shoring up the Fort Dearborn Building is under supervision of the architects for that building, Jenney, Mundie & Jensen, Chicago.

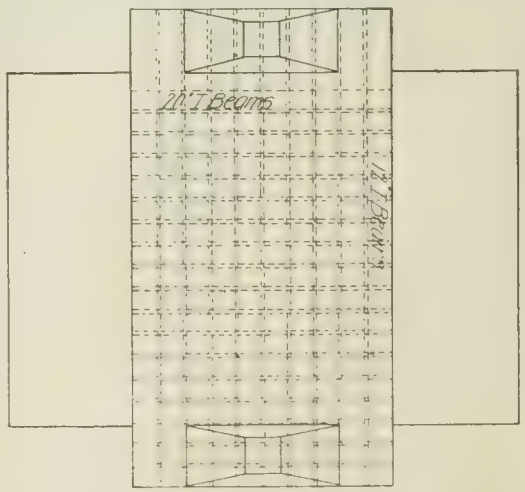

Fig. 3—Plan of Raft Foundation Shown in Fig. 2.

Work has been started clearing the right of way for the proposed connection with the Colorado & Southern and Burlington, which is through the most thickly settled section of Cheyenne, Wyo.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

An English Formula for the Camber of "Hanging" Roads.

In a paper read before a recent meeting of the English Society of Engineers, Mr. R. O. Wynne-Roberts, M. Inst. C. E., gave the following formula for the camber of hanging roads:

The camber necessary to permit of the road surfaces being efficiently drained without causing the sides to be too steep for comfortable traveling depends on the materials used, the longitudinal gradients, etc. Soft, absorbent

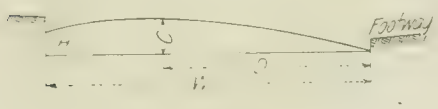

Fig. 1.

macadam requires a higher crown and steeper sides than hard, impervious metal, but the more camber that is given to a road the greater is the tendency for the traffic to keep to the centre. This necessarily causes the central portion of the road to be subjected to greater wear and tear, and when repairs are made this part is liable to be raised still higher. Many highways have excessive cambers, and need modifying so that the whole carriageway should bear a proportion of the traffic. The camber for durable detritus-bound macadam surface of level longitudinal sections should be about 4 per cent of the half width of carriageway, but when the road is tarred or covered with tar-macadam the camber can be reduced to 3, 2½, or even 2 per cent. Then for a 40-ft. carriageway, a water-bound macadam road, the crown would be $\frac{40 \times 4}{2 \times 100} = 0.8$ ft. or 9.6 in.; tar-macadam road $\frac{40 \times 3}{2 \times 100} = 0.6$ ft. or 7.2 in., or $\frac{40 \times 2.5}{2 \times 100} = 0.5$ or 6 in. respectively.

When the road "hangs"—that is, when the channels are not on the same level—the above rule will apply, but the position and height of the crown will be altered.

Let D = distance from crown to lower channel in feet.
W = width of carriageway in feet.
C = height of crown in feet above lower channel.
H = hang of road in feet
P = percentage of camber expressed as 0.02, 0.03, etc.

$$D = \frac{P \times W^2}{2 \times P \times W - H} \qquad C = P \times D$$

Example 1.—30 ft. road hangs 0.5 ft.; camber 3 per cent.

$$D = \frac{0.03 \times 30^2}{2 \times 0.03 \times 30 - 0.5} = \frac{27}{1.30} = 20.8 \text{ ft.}$$

$$C = 20.8 \times 0.03 = 0.624 \text{ ft.}$$

Example 2.—24-ft. carriageway hangs 0.75 ft.; camber = 4 per cent.

$$D = \frac{0.04 \times 24^2}{2 \times 0.04 \times 24 - 0.75} = \frac{23.04}{1.17} = 19.7 \text{ ft.}$$

$$C = 19.7 \times 0.04 = 0.788 \text{ ft.}$$

The position and height of the crown having been fixed, the contour of the road can be made to conform with a curvature on the lines shown in Fig. 2.

The distance between the crown and the channel is divided into four equal parts. Taking the elevation of the crown as unity, the above constants can be used to ascertain the other heights. Thus in the first example $D \times 20.8$, each division on the lower side will be 5.2 ft. wide, $C = 0.624$ ft.; the other points will be 0.53, 0.405 and 0.22 respectively. The upper side of the road will be $30 - 20.8 = 9.2$ ft. wide, the divisions will each be 2.3 ft. wide, and the height of the crown $0.624 - 0.5 = 0.124$ ft. above higher channel; other heights will be 0.105, 0.081, and 0.0435. In practice such small divisions will doubtless be discarded, and a gentle curve connecting the crown to the upper channel will be substituted. The above constants can, of course, be applied to lay out the contour of roads having channels on same level.

The foregoing rules must be modified when the longitudinal gradients of the road exceed, say, 1 in 200.

Notes on English Road Maintenance.*

TWO DESTRUCTIVE AGENTS.

There are two conditions of a road surface in which it is least capable of carrying the traffic: (1) when too wet, (2) when too dry—for excess or insufficiency of moisture so affects the surface as to bring it into a condition least fitted to withstand wear and tear. In the first instance the surface is so softened as readily to disintegrate, and in time of frost break up; while where there is insufficiency of moisture the matrix, by which the metal is held in position, is so dried up that it loses its holding-down power, thus allowing the stones to be easily shifted from their bed, and so ground to pieces by passing vehicles. Apart from the loss of metal entailed by either too much or too little moisture, the draught in either case is largely increased.

The road surveyor's aim therefore is to take all the care he can to combat these two agents tending to destruction, and to maintain his road in such a condition as to have a good surface no matter what the climatic conditions may be.

To enable him to attain this end there are various matters which engage his attention. Among others the selection of metal, the storage, spreading and consolidation of the same, scraping and brooming, drainage, etc. And so far as he is able to do so legally or by persuasion he must ensure free admission of sun and air to the road, where overhanging trees or high hedges are likely to produce injurious effects.

As regards his choice of metal; toughness combined with hardness is generally to be sought for. Hardness alone is not always advantageous. Flint is excessively hard, but its brittleness is against it. Again, cost in the form of freight practically puts a bar under certain conditions upon using, say, granite, where fairly good local materials are available. It may be noted that so far as the haulage of materials foreign to the locality is concerned from station or wharf, there is not a great difference whether it be granite or gravel, for a cubic yard of 2-in. Leicester granite weighs about 21 cwt., while a cubic yard of screened pit gravel, broken to the same gauge, weighs about 23 cwt. The difference in cost of wheeling out or carting from the depot and the spreading is not a serious item, but one has to take into consideration the difference in the price of the two metals delivered at the home station. For instance, take 2-in. Leicester granite, which may be put at 5s. 3d. per ton at the quarry, against 3s. 3d. per ton for Farnham gravel on bank at the Farnham pits in Surrey, and which delivered to any station in the county would not exceed 7s. 10d. per ton, yet the *minimum* cost per ton of the granite delivered in any part of Surrey may be put at 12s. 2d., giving a difference of 4s. 4d. per ton at the home station. From the maintenance point of view the latter is unquestionably preferable, but suddenly to change a long length of road surface from gravel to granite involves a heavy initial outlay and a gradual substitution of a better for an inferior metal is generally speaking to be commended.

This change should take place when the road requires refacing, not patching, and here I should like to give a few figures to the cost of the substitution of a granite for a gravel surface in my district. Taking the men's wages at £1 per week, horse hire at 8s. per day, 10-ton roller at £1 per day, and granite at the nearest station, 2 miles from the road, at 12s. 6d. per ton, the facing of the road with the granite may be put at 1s. 3d. per yard super., as against a trifle over 8d. per yard super., if gravel costing 5s. 4d. per ton at the station were employed, representing a difference in round figures of £300 in a mile of road averaging 18 ft. in width.

With wide country roads, say, 25 ft. to 30 ft. between the verges, the plan may be adopted of forming the crown, say, 15 ft. to 16 ft. in width, of the more costly material, while the haunches are made up with the local metal.

Some eminent authorities assert that it is unwise to mix materials, but so far as my experience goes good results have been obtained, and roads subjected to a medium amount of traffic have stood well when a mixture of about 3 of gravel to 1 of granite have been used, or where the gravel is particularly clean and more round than angular in shape, 4 of gravel to 1 of limestone. In such cases the granite or limestone should be of a smaller gauge than if laid alone.

Mechanical means, in the shape of the scarifier attached to the roller, has largely superseded manual labor in loosening the old surface before adding fresh metal, and the face is entirely moved to a depth of 2 in. or so. In the case of a road with a hard and fairly thick crust, and particularly if somewhat dry, this scarifying process is most advantageous; but for thin-crusted roads it is not always advisable; in fact, harm may be done by breaking up a very thin crust, as the water is then freely let into the bed, which is in many country roads little, if any, better than earth. Under such conditions, and with the help of a roller, a coating 3 in. to 4 in. in thickness laid on the unbroken road is about the best treatment, while where a roller is not used hand scoring to a shallow depth and at a time when the surface is softened with rain, should be resorted to, and a thin coating spread on the surface. And here I should like to say a word upon the importance of spreading the metal. The heaps as shot on the road should not be merely levelled down, but every stone should be moved in the spreading. By this means much greater uniformity in the texture of the surface is secured.

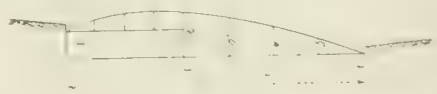

Fig. 2.

In resurfacing, the sooner the roller passes over the newly-spread metal the better. Long lengths of unrolled metal, spread from verge to verge, are not only a source of annoyance to travelers but do much harm to vehicles, while, in the case of unrolled roads, no more than two chains or so in length should be metalled at one stretch, a break of similar length being left and the next two chains metalled, and so on, thus giving horses a chance of regaining their wind at the breaks. On wide roads, one side can with advantage be dealt with at a time, provided a roller is used, and so an open road is maintained, the traffic using first the unmetalled part, and then the newly-repaired surface as soon as consolidated. In such a case care must be taken where the one side shuts on to the other to secure cohesion.

The steam road roller has made resurfacing

*From a paper by William Menzies, Surveyor of Egham Urban District, England read before the English Surveyor's Institution.

practicable at all times of the year (except when frost or snow prevail) provided there is a good supply of water within easy reach, but without it the remetalling is restricted to one period: i. e., during the winter months (and before Christmas for preference), so that the surface may be consolidated by the traffic, assisted by the winter's rain, before the drying winds of March and heat of summer come on. The roller, however, with water at hand, makes one independent of climatic conditions, and in these circumstances I strongly favor the early springtime for repairs.

The late autumn and early part of winter are times when the roads require a great deal of attention in the way of clearing, particularly if bordered by trees, and the roadmen can be well employed in this work, as well as attending to drains, water tables, channelling, etc., till the end of winter, when clearing, etc., is done with, and their time can be devoted to repairs at a period of the year when days are much longer and therefore more metal can be put on and rolled in per diem (where day work is employed) at little or no extra cost than during the dark days. Again, where the road is to be tarred, the sooner the surface is thus treated after it is consolidated and dry the better. Where water has to be fetched from brooks or ponds at a considerable distance, then the roller should be used in the autumn, otherwise the cost of drawing sufficient water thoroughly to moisten the binding material is great.

It is all-important that there should be plenty of material in stock where repairs, whether in the shape of resurfacing or patching are needed. In populous parts the store-yard has to be relied on for the supply of materials, as there are no broad grass verges, as in the case of rural districts, where depots can be made. It may be urged that the storage of materials in the yard necessitates the carting of metal from the station over the very roads for which in a short time it is needed, and then recarting it again to these particular roads; but a hand-to-mouth system of carting direct from the railway trucks on to the roads often has the disadvantage of an irregular and therefore unreliable supply at the very time when a constant supply is needed to keep the roadmen and roller fully employed. With plenty in stock advantage can at once be taken of climatic or other conditions best suited for repairs. It is also a ruinous policy to put certain materials on a road straight from the quarry with the quarry water still in them.

In rural parts the depots should be as far as is practicable at short intervals, to save either a long length of cartage, or of "run" when wheeled out. When the depots are at frequent intervals, I have a good deal of the wheeling-out done by piecework, and three men filling and wheeling at 4½d. per ton keep a 10-ton roller going, with one man spreading, two regulating, sanding, and brooming the surface, etc., the amount wheeled out generally averaging 33 tons a day.

PATCHING.

For patching only it is advisable to use a similar class of metal to that already forming the surface. The "life" of the surface can be prolonged to a very considerable extent by judicious patching, and a stitch in time will save many a nine, if the roadman has at hand the wherewithal to stitch, and applies the stitching process at the right moment. Hence the surveyor should see that a supply of materials suited for such work is within easy reach. The "lengthman" system here shows to advantage, for the man who all the year round has a certain length of road to attend to gets to know the weakest places, and can without loss of time, and often at the critical moment, do the required patching. The "lengthmen" should be picked and reliable men, for they are often in districts from headquarters, and must therefore be trusted to do the right thing at the right moment. A "lengthman" who can be so trusted is a valuable servant not only to the surveyor but to the community in general.

In the patching, the materials used should be of a smaller gauge than those employed in refacing the surface; they should be spread in a thin coating, and special care must be taken in the case of pot-holes, otherwise a hump is formed, and two new pot-holes are made by the traffic where only one existed—*viz.*, one on the running-on and the other on the running-off side of the hump.

The ever-increasing motor traffic is trying roads severely, and it will be seen on examining a surface subjected to much of this class of traffic that in the case where a hard material such as granite is used a series of these pot-holes is formed, while where a softer material is employed two parallel ruts are generally produced. With continuous wet weather it is surprising how rapidly these pot-holes and ruts are formed, and when once started they quickly go from bad to worse. To patch the former the metal immediately around the cavity should be loosened with the pick before new metal is put on, and a little "binding" is needed, while in the case of ruts the loosening is seldom required, but the new metal should be dribbled along the furrow. In both cases the roadman must be on the alert to see that any of the new metal disturbed by passing traffic—motor traffic in particular—is swept or shovelled back into its proper place.

SWEEPING.

The rotary horse-broom is an excellent device for clearing roads of mud, and it is found that a 6-ft. broom will sweep a much greater surface in an hour than a man can scrape in a day. Through the winter months the use of the horse-broom should not be stinted, and it does its work best when the mud is in a fluid state; but caution should be exercised in employing it in the early spring, or the very material which later on is wanted to hold the stones in their places may be removed.

I should like to add some remarks as regards the tar treatment, with which I am most conversant. I have found it to be a great palliative, a very good preservative of the surface, and at the same time it lessens the noise of traffic, horse-drawn in particular.

The surface to be tarred should be in excellent order, and better results are obtained on a hard road, such as granite, than on a soft one, such as gravel.

If the surface be hand painted, much time is saved by having two boilers, as one can be heating the tar while the other is being drawn from. The work is therefore much accelerated—this is a very important point—as in this climate the changes are rapid, and for the application of tar a bone-dry road is almost essential. Time should not be wasted when the surface is once dry. Wherever possible one side should be treated at a time, and an ample supply of sharp grit or chippings for covering the newly-tarred surface should be close at hand, this sanding operation following up the tarring as closely as possible, whether done by mechanical means or hand labor.

The grit should be perfectly free from all clay or earthy matter, and I have found a gauge of ⅝-in. gives the best results. Fine sand is not so good. With an open and well-drained road some little trouble arises with the tarred surface during lengthened periods of winter's rain, but where shut in by trees or otherwise and there is an excess of moisture the passing traffic churns up the face into a most objectionable black mud very difficult of removal, which sticks fast to and damages the varnish of vehicles. During dry weather in populous parts constant scavenging is necessary, as horse droppings dry very rapidly on the tarred surface and are swirled on to the footways and into the shops, etc., by passing motors.

The "life" of a road when tarred is greatly prolonged. I have carefully watched two lengths of my roads, the one having a granite and the other a flint surface, both of which were tarred in 1907, the process being repeated annually. These surfaces are subjected to heavy traffic, and I have come to the conclusion that between 1907 and now a saving of something like 9d. per yard super. on the granite and 6d. per yard super. on the flint road has been effected.

The cost of maintenance of different roads varies so much that even in the case of two districts bordering on each other it is by no means safe to assume that because the highway expenses are so much in the one case therefore the road upkeep in the other should be somewhere near the same. A large traffic in the one as against small in other; urban requirements in one as against rural needs only in the other; storage of materials in a yard as against the depot system; and many more questions affect the two cases. It is no uncommon thing to find that in one parish the cost of upkeep of the highways is entirely different on the town side of the railway line to that on the rural side.

In my own district there are two parishes, the one being urban in character and the other purely rural. They almost adjoin each other, but the cost of maintenance per annum in the one is in round figures 2¾ per yard super. of road surface as against 1½d. in the other, which again is adjacent to the main road having a large and increasing motor traffic. And while the cost of maintenance of the main road, 6 miles in length, has during the past five years been on an average 4¼d. per square yard, which is 50 per cent more than during the preceding five years, the roads of the adjacent parish, where the ordinary traffic has remained much about the same and which are but little used by motors, have only increased in cost 5 per cent in the same period. In both of these cases the wages, cost of rolling, horse hire, etc., are the same—*viz.*, roadmen 18s. to £1 per week, roller £1 per day, horse hire 8s. per horse, cart and man per day, cartage by piecework 7d. to 8d. per ton per mile, while the prices of materials are granite 12s. 6d. to 14c., flint 6s. 9d. to 7s., and gravel 5s. 1d. to 5s. 4d. per ton, at the stations.

Taking the average expenditure by the county of Surrey on the whole of its main roads for the last ten years the cost has increased during the past five by 43 per cent.

Dust Prevention by the Tarring of Road with Oil Gas Tar.*

Oil tar is a residual liquid resulting from the use of oil in the manufacture of carburetted water gas, which is used in many gas works for the enrichment of coal gas.

An analysis of the oil tar shows the following:

Specific gravity at 60°	1.0514
Water, per cent	1
Light oil 200° C. per cent	26
Pitch oil 200-240° C. per cent	36
Pitch and loss, per cent	37

The liquid is very inflammable, and great care must be taken in handling it and in its custody where left in a cart overnight.

The author desires to impress on his hearers in the most emphatic manner that oil tar must be used only on roads whose surfaces are in good order. If a road with loose patches or marked inequalities on its surface is treated, the results are certain to prove unsatisfactory, and if a road has lately been repaired with a steam-roller, sufficient time should be given for it to get thoroughly consolidated before treatment; it is also advisable if there are any recently filled in gas, water, or sewer trenches, not to allow the tar to run on to them.

The weather has a deal to say as to the results of the treatment. Warm, dry weather is indispensable to the proper drying in of the oil tar.

The author has found the following mode of treatment the most satisfactory: After the road has been properly swept, and the refuse removed, the oil tar, which has been brought to the site in water wagons with taps at their rear, is drawn off into galvanized buckets, and is swished on to the road in front of, from three to six men, according to the width of road. The sweepers proceed to sweep the liquid on in front of them, allowing none to rest in the channels or to get into the road gullies, and after having gone on a short distance, if they see that some portions look wet, they must go back and sweep it until the surface is comparatively dry. A cart should fol-

*From a paper by Fred P. Nixon presented at the Irish Road Congress at Dublin, Ireland, April 20-22, 1910.

low up with sharp grit, or coarse sand, which should be sparingly spread; this adheres to the damp surface, gives a grip and prevents horses slipping. The grit or sand should be about the size of oatmeal and spread at the rate of about one ton to 800 sq. yds. Half the road should be treated at a time, unless the whole road can be closed to traffic during, and for about an hour after, treatment.

Particular care should be taken that notice boards are placed at each end of the road under treatment, and at any side-roads, warning the public that oil tarring is in progress.

The author does not consider the macadam sides of tram lines should be treated, as the sanding and watering of the paved track spreads on to the macadam.

The roads under the author's care have not had more than two dressings in one season, the second dressing about one month to six weeks after the first, but he considers a third dressing towards the end of the summer would be very beneficial; the treatment not only prevents, to a very great extent, dust rising, but seems to bind and put a skin on the surface of the roads, which is plainly visible the next summer. The depth of penetration of the liquid varies from about 1 in. to 2 ins., according to the lentgh of time elapsed since the road has been repaired.

The road, for some little time after dressing, has a slight tarry smell from the oil tar, which is not unpleasant, and it is reported by medical experts to be an antiseptic of the coal tar series, which would destroy living organisms in manure before arriving at the dust stage, and so mitigate sore throats and diarrhœa.

Now, as to amount: the second dressing takes slightly less oil tar than the first, but on average 1 gal. will do about 7 sq. yds.

As to cost: taking all into consideration, carting from gas works (two miles), tar oil at 1d. per gallon; sand, labor, tools, supervision, and suits of oils for the men, it runs out at one halfpenny per square yard for road twice treated, or, taking a road 8 yds. wide—£29 7s. 1d. per mile.

Compared with watering for the season, the cost of which comes to (say at 1d. per 1,000 sq. yds.), £32 17s. per mile, taking road as watered four times a day for 140 days. The cost of a certain amount of scavenging is also saved.

The author does not wish it to be understood that he considers the oil tarring of roads to be a substitute for tar macadam, but for roads such as described at the commencement of this paper, it is an excellent substitue for watering in respect of cost and comfort.

The Maintenance of Trunk Roads in Bedfordshire County, Ireland.

There are two trunk roads in Bedfordshire. One of them is a portion of the London and Holyhead Road and is about 11½ miles long. This road lies chiefly upon a chalf base. It is very costly to maintain owing to the surfacing material being absorbed by the chalk during weather such as prevailed last winter. The other trunk road is a portion of the London to York Road and has a length of about 17 miles. The greater length of it is upon a gravel sub-soil and it is consequently less costly in up-keep. In a paper read at the recent Irish Road Congress Mr. W. H. Leete, county surveyor, described the methods of maintaining these roads and from his paper we have taken the notes that follow:

The roads are refaced yearly with strong material in sections, and the surface is tar dressed as soon as the new work becomes dry. If this work of tar-dressing is done in perfectly dry weather it produces a waterproof road sufficiently strong to endure the two following winters. Last season most of the rural portions of these two roads surfaces were tar-dressed, and, although the work was subject to great hindrance by frequent showers, the tar water-proofing, to a great extent, prevented the surfaces from lifting during the bad weather of last winter. Waterproofing under such bad conditions of weather is an outlay securing but slight advantages, as the full benefit, viz., the absorbtion of the tar by the warm dry road, causing a surface which will extend over two or more winters, is lost. Tar of good body and quality obtained locally at about 4 cts. per gallon was used.

In the manufacture of tar-macadam 50 lbs. of pitch to 40 gallons of tar was used. It was found that 6 gals. of tar will effectively cover a ton of dry 2¼-in. furnace slag, if the material is warmed and under warm weather conditions. If, however, the stone is not dry and warmed, 9 gals. will be necessary to cover a ton of material, and the extra amount of tar thus used is really superfluous. Overheated material will convert the tar into a varnish which will not bind the macadam, but will, if it be laid down, soon develop a loose and troublesome portion of road surface.

Tar-macadam, made up 30 years ago as described above, and laid down in the Borough of Luton main thoroughfare, has recently been broken up for tramway purposes. The main body of the material was in an excellent state of preservation, and it required considerable labor with a steel chisel to break it up. The surface of this material had been tar-dressed every second or third year and refaced with fine topping about every tenth year.

Tar Macadam at Mankato, Minn.

About four years ago the city of Mankato with the co-operation of the local gas company constructed a block of tar macadam pavement. This block proved so successful that two more blocks were constructed last year. This later work was done by contract under specifications prepared by Mr. John Wilson, City Engineer, to whom we are indebted for the information that follows.

The pavement is 30 ft. wide and one block has a grade of about 2 per cent and the other 11 per cent. The surface of the street was first excavated to a depth of 5 ins. below grade and then rolled with a 15 ton roller. Broken limestone, crusher run, was then spread over the surface to within 1½ ins. of the finished grade and then rolled until it would no longer creep under the roller, after which the whole surface was sprinkled with hot tar. The wearing surface was then applied; this consisted of the same limestone as the base, only broken to pass a 1-in. ring, and with all stone dust screened out. To each cubic yard of stone was added 18 gals. of hot tar and all mixed on a mixing board the same as concrete. The tar was heated to boiling by a steam coil passing into the tank containing it. At first the wearing surface was covered with stone dust and then rolled, but later this was found to be unnecessary and in fact not desirable, as the tar did not adhere to the roller, while the dust on being rolled seemed to destroy some of the binding qualities of the tar. The best results were obtained when the dust was spread in a thin coating after all rolling had been completed. The street was closed to traffic for a period of ten days.

The tar used was crude coal tar from the local gas plant, Pennsylvania bituminous coal is used, and the temperature of the retorts kept at about 1100° C. No attempt is made to refine the tar beyond removing the ammonia. An analysis of the tar resulted as follows:

Mineral ash, per cent	0.20
Specific gravity	1.249
Free carbon, per cent.	33.71
Amount distilled below 225° C. per cent.	0.00
Amount distilled between 225 and 270° C. per cent	6.77
Amount distilled between 270 and 360° C. per cent	17.25
Residue after heating to 360° C. per cent.	75.97

The briquette test was also made by mixing 12½ per cent by weight of tar with 87 per cent by weight of sand of such grade that it would pass a ten-in. mesh to the seive and be retained on one with 90 meshes to the inch. The briquettes were 3 ins. square and 1½ in. thick and after hardening seven days at room temperature, they were supported by the edges by two knife edges and required a weight of 213 grams on a third knife edge at the middle to produce bending and 281 grams before breaking. As might be expected from the high temperature maintained in the retorts, the free carbon was high; however, it seems to have effected the binding properties of the tar but little, judging from the character of the street.

None of the harmful effects to adjacent vegetation as reported by some have been noticed. It would seem that this effect might be due more to the volatilization of the lighter oils than to any small particles of tar that might collect on the leaves. These lighter oils would be present in very small quantities in tar with a specific gravity as high as that used in Mankato.

The stone was crushed and delivered on the street for $1.25 per cubic yard and the tar at the plant costs the contractor 3 cents per gallon. The cost of the pavement complete to the city was $0.764 per square yard. The people are all very highly pleased with the pavement and more will be constructed this year.

Notes on Road and Street Work.

Tar Spraying on Steep Gradients.—Some question has been raised as to the steepest gradient on which the spraying has been carried out without rendering a road dangerously slippery. In a recent issue of the Surveyor, Mr. Arthur C. James, Assoc. M. Inst. C. E., engineer and surveyor to the Grays Thurrock Urban District Council, states that for five successive years he has tarred a road having a gradient of 1 in 16 for a length of about 200 yds. He further adds that this is part of a main road of considerable traffic and that there has been no complaint of slipperiness.

Prices for Paving Work in Iowa Cities in 1909.—The following figures taken from the Proceedings of the 22d annual meeting of the Iowa Engineering Society show the prices paid for paving work in a number of Iowa cities in 1909:

BRICK.

	Per sq. yd.	Remarks.
Boone	$1.575-1.67	5-in. concrete base.
Cedar Rapids	1.49 -1.58	4-in. concrete, 2-in. sand.
Council Bluffs	1.935-2.075	5-in. concrete base.
Davenport	1.45 -1.64	5-in. concrete base.
Des Moines	1.34 -2.13	
Dubuque	1.65	Macadam base.
Fort Dodge	2.14[1]	5-in. concrete base.
Keokuk	1.49 -1.59	6-in. crushed stone, 2-in. sand, sand filler.
Mason City	1.90[2]	5-in. concrete base, 2-in. sand.
Montezuma	1.895	4-in. concrete base, 1½-in. sand.
Newton	1.76	Concrete base.
Oskaloosa	1.665	1-in. sand.[3]
Ottumwa	1.86	6-in. concrete base.

ASPHALT.

Davenport	1.84 -1.89	5-in. concrete base.
Des Moines	1.99 -2.48	
Waterloo	1.87	5-in. concrete, 1-in. binder, 1½-in. top.
Waterloo	2.19	6-in. concrete, 1-in. binder, 2-in. top.

[1]Brick block. [2]Purington block. [3]Under 2 courses of brick.

Prices on other types of pavement were as follows: Cedar Rapids, 12-in. tarvia macadam, $0.64 to $1.02; Clinton, creosoted wood block, 3-in. block, 1-in. sand, 5-in. concrete, $2 to $2.13; Clinton, 8-in. macadam, $1.40; Davenport, 2,304 sq. yds. of tarvia, $1.23; Des Moines, creosoted wood block, $1.99 to $3; Dubuque, macadam, $0.65; Fort Dodge, creosoted wood blocks, 3-in. block, 5-in. concrete base, $2.4375; Fort Madison, 10-in. tar mac-

adam in two courses, $0.95; Grinnell, bitulithic on 1—3—5 concrete base, $2.13; Knoxville, creosoted blocks on 5-in. base, 1-in. sand cushion, $2.35; Mason City, concrete, 2-in. top, 5-in. base, $1.29; Montezuma, concrete, $1.29.

The amount and prices of curbing constructed in 1909 were as follows:

	Lin. ft.	Price per ft.		Remarks.
Boone	6,243	$0.197		1 2
Cedar Rapids	40,717	.2975-	.35	
Clinton	4,000	.40		
Davenport	43,488	.25 -	.30	5"x18", on pav.
Dubuque	5,228	.70		
Fort Dodge	2,300	.40		6"x20"
Keokuk	1,097	.69 -	.72	
Mason City	2,000	.40		22"x5", 1:2
Montezuma	15,000	395 -		6"x20", 1:3:5
		.435		5"x20", 1:3:5
Muscatine	9,600	.575		5"x20"
Newton	5,100	30		
Oskaloosa	400	.41		
Ottumwa	9,523	.42		6"x20"
Red Oak	42,000	.35		

The prices for combined curb and gutter were as follows:

City.	No. lin. ft.	Price per ft.
Cedar Rapids	9,831	$0.34
Clinton	1,700	.60
Council Bluffs	11,858	.54-.58
Davenport	23,892	.66
Dubuque	7,150	.65
Ft. Dodge	10,190	.53
Ft. Madison	5,000	.47
Grinnell	8,000	.54
Keokuk	1,560	.65
Oskaloosa	3,197	.63
Red Oak	27,471	.51
Waterloo	47,533	.60

(Continued from page 567.)

Withey, "The Scleroscope," by A. F. Shore, followed by a general discussion on tests of metals for hardness; "Some Testing-Laboratory Accessories," by J. Madison Porter; "The Brinell Ball Test Applied to Wood," by W. K. Hatt; "Apparatus for Repeated Loads on Concrete Cylinders and a Typical Result," by H. C. Berry; "An Autographic Rubber-Testing Machine," by T. Y. Olsen; "The Work of the Structural Materials Testing Laboratories During the Past Year," by R. L. Humphrey.

The eighth session, on the afternoon of July 1, will be given up to a discussion of reports from the committees on waterproofing materials, on standard tests of insulating materials and on standard specifications for coal, and to a consideration of the following papers: "The Determination of Soluble Bitumen," by Prévost Hubbard and C. S. Reeve; "Improved Instruments for the Physical Testing of Bituminous Materials," by Herbert Abraham; "Necessary Reforms in Specifications for Petroleum Products," by Albert Sommer; "A New Machine for Testing Pitch," by T. Y. Olsen, and "Fuel Investigations of the U. S. Geological Survey During the Last Year," by J. A. Holmes.

The ninth and closing session will be held on the morning of July 2. Reports will be received from the committees on standard specifications for paving and building brick, on standard tests of road materials, on standard specifications for vitrified clay and cement sewer pipe, on standard specifications for grading structural timber, and on the magnetic testing of iron and steel. Two papers are also scheduled for this session: "A Comparison of Magnetic Permeameters," by Charles W. Burrows, and "The Exponential Law of Endurance Tests," by O. H. Basquin.

Further information regarding the convention may be had from the society's secretary, Prof. Edgar Marburg, University of Pennsylvania, Philadelphia, Pa.

Dynamite Contract, Panama Canal.—The contract for dynamite for the fiscal year 1911 has been let to the DuPont-De Nemours Powder Co. of Wilmington, Del., the amounts and prices being as follows:

45 per cent—8,540,000 lbs., at 11.7 cts.
60 per cent—5,187,000 lbs., at 12.7 cts.

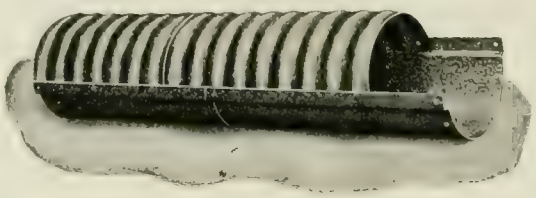
The amounts quoted are estimated as the possible requirements for the fiscal year, but not more than 50 per cent of the estimated amount need be purchased. The first deliveries will be made in August.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

A Corrugated Iron Culvert withm Sooth Bottom Plate.

The accompanying illustration shows a patent metal culvert, differing somewhat from most metal culverts, which has recently been placed on the market. One of the features of this culvert is the smooth bottom plate, which permits a free flow of water, mud, pebbles, sticks, etc.



Corrugated Iron Culvert with Smooth Invert.

In setting up the pipe, two bottom sections are bolted together, after which a short piece of corrugated top is added, then a full sized section of the top, alternately, until the desired length is obtained, the last section of the top being a short section. In this manner all joints are staggered. The top pieces are joined by a lapping of one corrugation, one end being made a small fraction of an inch smaller, for this purpose. The bolts, which are also galvanized, all come on the sides of the pipe, passing through the flange of the smooth bottom, and through the corrugated top.

The pipe can be closely nested, and when this is done can be handled with the greatest ease. The construction and method of assembling is so simple that it is stated that an unskilled laborer can set up a 20-ft. section of pipe in 20 mins., the only tool required being a wrench. The culvert is handled by the Highway Culvert Department, 201 Devonshire St., Boston, Mass.

The Cost of Furnishing Water With Reference to Rates and Rate Making.*

No argument is necessary to sustain the position that any investment for the public service, if conservatively and intelligently made, should be expected to result in earnings which will maintain the investment intact and guarantee from the investment a fair return. The returns should be commensurate with the risk involved, otherwise the public can not expect to secure service when such risks exist. Fair returns, therefore, must include:

(1) Interest on the investment necessary to construct the plant and to develop the public utility into a going concern.

(2) Depreciation and maintenance charges sufficient to maintain the investment intact.

(3) Cost of operation, including station and distribution expenses.

(4) Cost of business management including office expenses, collection charges, etc.

(5) A reasonable profit in addition to the above and commensurate with the risk involved.

It is only through the prospect of such returns that the necessary funds can be secured for the construction of public utilities.

As with other investments, the returns from public utilities, especially in the smaller communities, are frequently disappointing, and the actual earnings are often less than a "fair return." On the other hand many such utilities in the larger communities are very profitable and in some cases these profits have been so great as to warrant the feeling that they were unfair to the public and should be reduced to reasonable limits.

With the question of reasonable limits comes a marked difference in opinion according to the point of view from which the matter is considered.

In considering the adjustment of rates for the services of any public utility, popular judgment is usually based, perhaps naturally, on a comparison with similar rates in other localities. Such a comparison is also frequently the sole basis of attempted rate regulation by local authorities. Where the conditions are essentially similar in the localities compared, the results may be essentially equitable, but the mere comparison of rates, without taking into consideration, in detail, the local physical conditions, may frequently lead to most unjust and unfair conclusions.

This is especially true in the adjustment of water rates, for the conditions which control the cost of services, vary so greatly with the character of water used, the treatment necessary for rendering the supply suitable for domestic and manufacturing uses, the height to which the water is to be raised, and other factors of this character, that in many cases the fair returns for one plant should be quite different from that which might be equally fair for another.

Without discussing the matter at length the writer feels assured that the basis of rate making, above set forth, is the true basis on which an equitable adjustment of such matters must be made. In arriving at the findings on this basis, much difference will result, for estimates of valuation, depreciation, maintenance, etc., can by no means be made exact.

As illustrating the effect of varying conditions on the necessary cost of service and the necessary variations in rates due to such conditions, and as further illustrating the injustice of the attempt often made to reduce rates without due consideration of the above principles, the following data is offered concerning a case which was under litigation in the city of Chicago in 1904-5.

About 1904 the City of Chicago extended its limits taking a certain territory which received its water service from a private water company. Some of the citizens of the new ward objected to paying the rates charged by the water company, and an ordinance was passed by the Chicago City Council reducing the rates of the water company in the new ward to the rates charged by the city for similar services in adjacent territory. The company resisted this change in rates, and the following report was submitted and formed the basis on which the case was presented:

In the matter of the estimate of the "fair return" or equitable income which the water works plant of the ..... Suburban Water Company at ..... should earn, I wish to call your attention to the following facts:

The City of Chicago have attempted to force this company to reduce its rates in ....., which is now within the limits of Chicago, to those charged by the City of Chicago itself. The inequity of this will be seen by all who examine into the different conditions under which the two plants are operated, and who recognize the fact that the expense of operation, and the consequent necessary "fair return" depends almost entirely on such conditions.

The following parallel comparison of the plants owned and operated by the City of Chicago and by the ..... Suburban Water Company will serve to illustrate these differences. The latest data for the Chicago Water Works is for 1901. I therefore compare it with the Suburban works for the year ending July 31, 1902, with which such data most nearly corresponds in time.

*Paper by Prof. Daniel W. Mead, University of Wisconsin, Madison, Wis., before the American Water Works Association, New Orleans Convention, 1910.

COMPARISON OF WATER WORKS.

	Private Waterworks. 1901-2.	Chicago Waterworks. 1901.
Estimated value of works	$600,000	$34,000,000
Population served	25,000	2,000,000
Investment per capita	$24.00	$17.00
Miles of mains	62.50	1,890
Consumers	4,096	227,500
Consumers per mile	65.5	120.0
Mains per consumer	80.8 feet	44.0
Source of supply	Artesian Wells	Lake Michigan
Sanitary character	Unquestionably good	Suspicious
Height raised by pumping	226 feet	106 feet
Annual pumpage in million gallons	370.4	125,130.5
Average daily pumpage in million gallons	1.05	342.83
Annual income from works	$62,234	$3,397,928
Actual operating expenses	$34,249	$1,138,392
Depreciation 1% on valuation	4,800	300,000
6% interest on valuation	36,000	2,040,000
Total annual expenses	$75,049	$3,478,392
Net loss per annum	$12,815	$80,464
Cost of pumping 1,000 gals.	22.82 cents	2.79 cents
Income per 1,000 gals.	16.76 cents	2.76 cents
Actual loss per 1,000 gallons pumped	6.06 cents	.03 cents
Cost of operation expenses per 1,000 gallons	10.8 cents	.91 cents
Cost of operation per consumer	$9.15	$5.00

The above comparison needs little comment. It might be considered equitable when a water works can pump water at 3 cts. per 1,000 gals., to place the minimum meter rate at 10 cts. per 1,000 gals., but it should be noted that when interest and depreciation are considered the City of Chicago itself, does not receive a fair return on this basis, but received only 2.75 cts. per 1,000 gals., and sustains an actual loss of .03 cts. per 1,000 gals. pumped. Thus it is seen that Chicago itself, in order to receive a fair return on the cost of operation and investment, should raise its rates above those now charged. Such losses should be anticipated, and are due to leakage, wastage and to free water which is furnished to some extent by all plants.

The greater cost of pumping smaller quantities of water under higher heads is also well shown by this comparison. That this is not peculiar to this suburban plant, but is the necessary consequence of the conditions, is known to every water works engineer.

The City of Chicago in some of its smaller works furnishes good samples of this fact. Take, for instance, Washington Heights. At these works the station expenses were as follows:

	Operating exp.	Repairs.	Total sta. exp.	Total 1,000 gals. pumped.	Cost per 1,000 gals. on station exp.
1900	7,263.68	844.07	8,107.75	118,195	6.85
1901	8,715.18	1,262.73	10,477.91	139,176	7.47
1902	6,555.50	2,354.65	8,910.15	156,954	5.68
1903	8,485.56	747.69	9,233.25	243,565	3.79

At Norwood Park, the works also operated by the City of Chicago show expense as follows:

1900	4,948.52	138.03	5,086.55	30,200	16.88
1901	5,098.51	376.22	5,474.73	28,380	19.35
1902	4,342.37	736.90	5,079.27	28,195	20.55
1903	4,170.78	200.18	4,370.96	26,356	16.59

These figures include only station expenses. If to these were added cost of supervision, general repairs, collections, deterioration and interest on the investment, it is obvious that the cost would in every case, be increased from 20 to 40 cts. per 1,000 gals.

It should also be noted that at Washington Heights the head pumped against 109 ft., or less than one-half of the head at ..... The head pumped against at Norwood Park is unknown to me. The charges the city is making for water in these suburbs could only be sustained by a general tax or by making the other water takers of the city pay for the yearly loss thus incurred.

The details of the cost of operation of the ..... Water Works for the last three years is shown in the following table:

ANNUAL OPERATING EXPENSES.

	1902.	1903.	1904.
Fuel	$10,180	$11,700	$12,500
Taxes	5,031	3,756	2,780
Insurance	457	16	127
Legal expenses	600	1,826	1,401
Supplies	1,331	1,297	1,514
Repairs	3,522	3,575	3,135
Printing	203	288	175
Telephone	61	70	91
Oil and waste	732	610	670
Cartage	626	500	680
Miscellaneous expenses	750	585	658
Envelopes	158	106	159
Labor	10,598	11,451	11,605
Total	$34,249	$35,720	$35,495
Int. on value of work	$36,000	$36,000	$36,000
Deprec. (1% of $480,000)	4,800	4,800	4,800
	$75,049	$76,520	$76,295
Total income	62,235	70,741	76,815
M. gallons pumped	370,300	391,000	454,800
Cost per M. gallons based on operating expenses	$ 9.17	$ 9.10	$ 7.78
Cost per M. gallons based on total cost	20.30	19.60	17.89
Gross inc. per M. gals.	16.76	18.10	17.85

The foregoing table shows that the Suburban Water Company had been operated at a loss at their established rates, and that any reduction would be inequitable.

The court so held. The matter was afterwards adjusted by the City of Chicago purchasing the distributing system within the city limits, which they then connected with the city system

DISCUSSION.

Stuart Wood, Philadelphia, Pa.—A waterworks perhaps differs from any other industry in the fact that the proportion of capital employed to the operating expenses is greater than in anything else. I presume that there is no other large industry where approximately as much as one-half, or even in many cases more than one-half of the cost of furnishing the commodity is due to the costs and depreciation of the plant, as is the case with waterworks. Private waterworks companies, of course, are compelled to take this into consideration in establishing their costs; but that is always not the case with municipalities, and the accounts of the latter are not kept with the same objects in view. As a result I think it will be found that very often municipal operating costs are published which are made up simply of operating expenses, wages, fuel, and ordinary repairs. I have in mind myself one city which feels very well satisfied that it is making a profit on its waterworks, where they charge to cost of operation, interest on a little more than $1,000,000 of bonds, and the value of the works they claim to be about $10,000,000. Now of course published rates based upon such figures as that are very mesleading if they are supposed to cover the actual cost of furnishing water; and to compare such rates with those of neighboring cities is very unjust. But such a practice is very often prevalent, and I think in consideration of this fact it should impress upon our minds the very great importance of a uniform accounting which will apply to municipal as well as private plants. Such in fact is the purpose of the present legislation in Wisconsin. I think that any legislation for the benefit of waterworks ought in fairness to enforce that rule with regard to municipal and private plants alike.

W. F. Wilcox, Meridian, Miss.—I heartily agree with Mr. Wood. The reason why a great many municipalities say that they pump water for a certain figure is because their books do not show thoroughly every item of cost. I represent a municipal plant, yet I was raised a corporation man. I have had this to contend with in the management of a municipal plant, that the politicians want to show the people how little they are charging for water and how little it costs to furnish it. It is not fair to say that depreciation and similar items cost nothing. It is simply a political game. The municipal superintendent, therefore, finds himself in an attitude that is antagonistic to the politicians whenever he attempts to state the true cost of pumpage. I think that Mr. Wood's suggestion as to uniform accounts is a very timely and proper one. In our city we charge for everything the city gets from us, and we credit the city for everything we get from it. If we have the city engineer run out a line for us we pay the engineering department for it. If we have the board of public works repair a street, we pay them for it. If they get any water from us they pay us for it. We do not carry any fictitious charge on our books as to what the city owes us for water; but in fixing our rate we adopt what would be a reasonable charge if a corporation owned the plant. We also take into consideration what taxes that corporation would pay to the city. Deducting these taxes from what would be a fair charge by the corporation, leaves what we charge to the general city government, and we collect that every year in cash. Our plant supplies 30,000 people. Our total pumping cost at the station is $20.40 per 1,000,000 gals., including filtration. Our water flows by gravity during a portion of the year; but in the dry season we have to double pump water from the impounding reservoir. That runs up our cost a little bit. We figure the actual cost of operation, the interest on the bonds, and the depreciation charge. As to the latter we played a little politics on the politicians. We figured out what was the depreciation as nearly as we could get at it, and arranged so that that amount of our city bonds would come due every year. We pay off that portion of bond issue every year to take care of the depreciation. I want to call attention to one point: Municipalities in the south borrow money from 1 per cent to 1½ per cent below what their private corporate competitors do. That is one of the unfortunate things that the private plants have to contend with. I believe I am right in stating that the majority of the private companies pay 6 per cent. We pay 4½ per cent; so you can see that we have a practical advantage of 25 per cent in the time of interest.

T. C. Phillips, Chicago, Ill.—I could explain the situation at Washington Heights, which is one of our suburban stations, located about nine or ten miles from the pumping station. The section line is a 16-in. main, which is used for the service pipe line also. The Washington Heights station pumps against 60 lbs. pressure. We have found in the last few years at times we are not able to maintain 60 lbs. pressure, because every now and then our small pumps were frequently a source of a great deal of error, and did not show the actual conditions. These pumps have since been replaced by others, and the figures as compiled for 1901 and 1902 show a total ordinary expense for pumping water for the city of Chicago to be about 3 cts. per 1,000 gals. Perhaps it would be well to explain that this does not include any fund for sinking fund purposes but includes the total ordinary expenses only. With regard to the question of rates some of us believe in the city of Chicago that the present rate is too low. For instance, by the time we have our water delivered to the consumer the cost of water might be nearer a figure considerably above our present meter rate, for the reason that a very small percentage of our water is actually delivered. The purification of the water is not taken into consideration at all, I believe.

John W. Alvord, Chicago, Ill.—If anybody would say inside of the city limits of Chicago that our Chicago plant was not making money, I would not like to guarantee what would happen to him. The general impression is that our Chicago water plant is a great money winner. As Mr. Phillips has pointed out, for a number of years large portions of the money in the water fund has been used for other purposes connected with the purification and the maintenance of the purification supply. For instance, large conduits which are really sewage conduits which have no connection with the water system, but which are merely a protection to it in keeping the sewage out of the lake. The comparison is a very interesting one, something which I have wanted to see made for a long time. I understand, that in this 3 cts. the interest and the cost of the

purification is not included. That is where the whole thing lies. The distribution system of the Chicago waterworks is largely a resultant from special assessments. Having once built this through special assessments no further account is kept of the capital cost. As Mr. Wood has very well pointed out, the capital cost of furnishing and distributing water, with these fixed charges is one of the greatest items to be met and accounted for. Of course, not having to account for this item, Chicago, together with most cities, finds that its revenues are such that they can reduce the rates and have money to spend at times for other purposes. The fact has been alluded to here that so many municipal reports are unreliable, perhaps not always intentionally so, but because of the ignorance of the municipal accountants of the true principles and method by which all these capital accounts with their fixed charges should be treated for operative purposes. It seems to me there is in municipal reports such as have come under my observation for many years another curious psychological feature, if I may be allowed to term it such, the desire to make a better showing than a predecessor. This is a very insidious temptation, and while it does not always involve anything like falsification, it very often involves carelessness in going thoroughly into the matters involved. For instance, it was my lot at one time to examine the municipal business over a period of one year in one of the larger cities of our central west. Each annual report of the superintendent of that plant charged up a certain amount for coal to his engines for pumping; and it was remarkable how year by year each superintendent managed to pump water for a little bit less a year than his predecessor had done, and after each change in superintendents there was a remarkable change for that year. But, fortunately, vouchers, for the purchase of the coal were also in existence and were possible of utilization; and after comparing these along from year to year it was seen that there was a considerable amount of coal which had apparently disappeared. I took a great interest in thus securing the actual account, and computing it year by year; and after adding it to the coal pile I found that during 40 years' operation that the amount of unaccounted for coal produced a pile about 330 ft. high that would extend over a good sized city block.

Charles B. Burdick, Chicago.—It is customary in making comparisons of the cost of furnishing water to base the comparison upon the cost per 1,000 gals. That seems to be a good basis of comparison. It is true that the majority of our systems are not metered, and therefore the only place where the water can be measured is at the pump. It is also true that there is a very large discrepancy in every waterworks plant between the amount of water which leaves the main station and the amount which reaches the consumer. There are comparatively few of our plants now where all consumers are metered; and it has been found in plants that are considered as well regulated plants that all the way from 25 per cent to 60 per cent of the water pumped never reaches the consumer. Therefore, the important proposition in comparing rates for water on the basis of 1,000 gals. is to consider the percentage of loss of water in the mains and services. If the cost is based upon station pumpage the error of making a comparison of cost of that with the cost per 1,000 gals. supplied to the consumer is evident.

Leslie C. Smith, Cleveland, O.—In the discussion of this matter of the cost of furnishing water I cannot but believe that a vital part of it must hinge upon the cost under varying conditions. The cost of supply differs widely in different plants. But the matter of pumpage ought to be a common basis of comparison in all plants. So that, following the remarks of a previous speaker, it is not the cost of the water delivered that offers a correct basis of comparison between one city and another, but it is whether or not each individual department that has to do with the furnishing of this water will compare favorably with a like department in another plant. For instance, from the time the pumps take the water until that water enters the main we may call that the pumpage, and include labor, fuel, oil, waste, etc. Now, if the matter of purification enters, that is another sub-division. If that added to the cost is to be taken as a comparative basis for another city, whether it be in softening, purification or whatsoever else, right there the figures must diverge and are unfair. So must the question of supply be considered. I find the only helpful part in a comparison is in being able to select the things that apply to my own individual situation as compared with like conditions in another city, to see if I am producing and pumping as much water, and if I am supplying and delivering as much water at the same cost as another city is doing it. If not, then there arises the question in my judgment of an improvement in some particular.

S. J. Rosamond, Fort Smith, Ark.—In my city I am pumping 150,000,000 gals. of water every 24 hours, and in another city they are only pumping from 3,000,000 to 5,000,000 gals. every 24 hours, the latter would certainly present different conditions. Then if there is a different head to pump against that would make a difference. I cannot see where you can draw a fair comparison based simply on rate figures alone without taking into consideration the conditions under which the plant is operated, or the class of machinery that is used and that is necessary for that plant to meet those conditions, and all those various details that are included in the pumping stations under which the companies compared are operated. I have been up against this comparison business since 1905. It has caused me a great deal of trouble. I have had some of our aldermen quote rates from some city where the department takes no account of taxes and probably has no bonds out and have their plant paid for, and are taking no account of the capital investment, the only accounting being bare cost of fuel and salaries, which of course does not furnish a fair basis of comparison. I cannot see that such a basis could be furnished except by taking into consideration the difference in cost per 1,000 gals. for delivering water at the tap, and in ascertaining the cost of that the property investment must be considered, as well as all other proper items of cost.

Dabney H. Maury, Peoria, Ill.—It seems to me that the whole question of comparison or rates ought to be viewed from two points of view. I think it ought to be admitted that if we are considering the rates in any one location those rates should be based upon the cost, distributed among the various kinds of services, such as public and private fire protection and the individual consumers; that there should be no free water to any one, but that each of these three classes, and as nearly as possible each consumer in each of these three classes should pay his just quota of the fairly distributed charges, no more, no less. A water department ought not to make a profit on one at the expense of the other. That ought, I think, to constitute a basis for fair rates. It follows that as the conditions vary in all plants it is absolutely necessary to consider all of the conditions involved in any specific case before you can decide what ought to be a fair rate. When you come to compare one plant with another, which is the second point of view for consideration in the question of rates, it seems to me equally indisputable that you consider the service which is furnished for the rates as well as the conditions by which the supply is surrounded. The basic question which was put up for solution in the National Civic Federation investigation of municipal ownership and operation, was the cost to the consumer of a comparable unit of service. Now a great many things enter into what constitutes a comparable unit of service. Sometimes everything is included in a rate. Very often that is not the case. It may sometimes ever treble the amount of a rate in order that the service furnished for it may come up to the standard which may perhaps be fully covered by the water rate in some other towns. If a plant be built by a special assessment, that does not appear in the water rate. If a plant be municipally owned and does not pay taxes, that does not appear as against the cost of production and is therefore not included in the water rate. If there be deficient protection against fire by reason of lack of pressure, that means extra appropriations for the fire department and extra insurance premiums; and that does not appear in the water rate. If the water be impure, and by reason of fear of disease large amounts of bottled water have to be bought by the community, or even other liquids have to be consumed, that does not appear in the water rate. If the pressure is insufficient to furnish the upper stories of houses with the desired supply, with the result that increased pumping is required which has to be put in in the most expensive manner in small installations on owners' premises, and operated, therefore, at a very large unit of expense, that does not appear in the water rate. So that really when you get down to a final analysis and endeavor to compare what is being done in one city with what is being done in another, you have to take all these things into consideration, or otherwise you may be led into an unfair comparison.

Dow R. Gwinn, Terre Haute, Ind.—Personally I feel under obligations to Mr. Mead for having prepared the excellent paper which has brought out this discussion this morning. I was especially interested in the points made by Mr. Maury with reference to the question of service. I had occasion last summer to visit an eastern city where they furnish water to the metered customers at a rate of 5 cts. per 1,000 gals. That rate is frequently quoted to private companies as an argument to private companies to furnish water at the same price. I asked a friend in that city about his water rate. He told me it was very cheap indeed, very low. I said, What about your drinking water? He told me how much they had to buy and it figured up to $3 per month, or $36 per year. I asked him if it would not be cheaper if he paid a higher rate and got a better quality of water and would be relieved of buying drinking water outside. I am glad to see a growing disposition on the part of the courts to take into consideration differences arising from locality and their different conditions in the cost of producing service. The legislatures are looking at it also in that light, and it is time that they did. But in Kansas the legislature recently passed a law which provides that the city commissioners, where the government is under the commission form, can fix the water rates, and gives them full power to fix the rates to be charged by a company not only to the citizens but to the city as well for fire protection, but they are not allowed to make those rates lower than such as to enable the company to earn 10 per cent on its investment after paying operating expenses, cost of maintenance, taxes, etc., which I think is very fair indeed. It allows for cost and also for maintenance. That seems to be one of the fairest laws that I have come against for some time.

A. H. Wehr, Baltimore.—It was such considerations as have been mentioned which the committee on uniform reports and accounts have had in mind, and which emphasized the importance of the work which has been begun by the committee. The various points which have been raised in this discussion have all been carefully considered by us and also by the Census Bureau at Washington, in the attempt to arrive at some scheme of accounts which would make it possible to present for consideration all the various factors entering into the service of water supply in connection with a comparison of rates. I have in mind one matter that has always struck me as very wrong and unjust—namely, the water rates charged by the municipal department of the city of Baltimore. My company operates immediately on the outskirts of Baltimore, and a comparison is often made between the city rates and our own. After going through the old records for as much as twenty-five years back in searching through the city archives I found the extraordinary fact that a resolution had been adopted upon the recommendation of the then mayor of Baltimore, that in order to encourage the introduction of manufactures into the city large factories and con-

sumers of water should be given an especially low rate; and in accordance with the recommendation the Baltimore city council passed an ordinance directing the water board to install metered services for manufacturers and other large consumers of water; and instead of giving them the flat rate charge they were given the very low rate of 6 cts. per 1,000 gals., and that price is what they are charged today, whereas other consumers are now charged a less rate. Under the schedule rates to domestic consumers the average rate paid in Baltimore by them is less than 4 cts. per 1,000 gals., whereas manufacturers to whom it was originally intended to give an exceptionally low rate to encourage them to come to Baltimore, are paying 6 cts. per 1,000 gals. No one seems to know the difference; no one stops to inquire why that condition exists, and it is apparently not observed except by those of us who are interested in the proposition as waterworks men. When we began to analyze the figures we found that the only charge that is made based upon the cost of water is to cover coal expenses, the operating department and the interest on the bonded indebtedness. No depreciation charge has ever been made. A sinking fund is provided by direct taxes, and every year or two there is a special appropriation in the budget to cover the deficit in the various departments. That is a condition I think that is not rather unusual. It occurred to myself as one member of this committee that that city should be informed that there is no department or company that is fixing its rates today upon the proper basis We know the amount of work that has been done in connection with the fixing or gas rates and electric light rates. We have heard of a sliding scale, the Boston sliding rate, the Dougherty rate, and a number of other rates in connection with gas and electric light. It was impossible for us to embody all the various schemes of rate making and apply them to water rates fully. Before one could do that the conditions must be substantially the same in all plants. The biggest capital investment should be considered, also the capacity of your plant and whether that capacity is used in full or only in part; and the rate to my mind should be divided at least into two factors, one being fixed representing the approximate demand, and the other being variable, representing and embodying the consumption and the customer cost. The demand cost is that cost which is fixed, based and predicated entirely upon the capacity of the system; consumption cost is that cost which varies with the quantity of water consumed. The customer cost depends upon the number of customers, and runs up by jumps. As your customers increase several thousand you have to increase your force, and the customer cost increases accordingly. It has occurred to me that the proper method, or one that might be tried until found wanting, would be a fixed flat rate based upon the number of feet of the distribution system which is occupied by the premises of each and every consumer. This is fixed without regard to the quantity of water in use. When a flat rate covering these costs is once established you will find that the meter rate covering consumption cost will be very low. In that way a low rate is automatically applied to the large consumer of water, and a relatively higher rate to the smaller consumer. The entire question of rate making, it seems to me must have some basis of this character in order to be just to yourself and absolutely and fairly give you a proper comparative basis as between municipalities and private plants without regard to their location, but having regard only to the conditions under which they operate and to the variable service they furnish.

A. A. Reimer, East Orange, N. J.—It seems to me a great deal has been said about the weakness of the municipal ownership system, and I think that it deserves a little word of commendation. In our plant in East Orange we still hear rumblings of comparisons between the old rates established by the private water company from which the city purchased and the present rates. Fortunately for us those rumblings are becoming less and less numerous, for we have given every one a chance to investigate to the fullest extent the department management, the financial system in use, the system of revenue, etc., and there seems to be general contentment now. We account for everything, or try at any rate to account for every department in our water supply system. We account for the interest on the bonds; we account for the sinking fund. We pay it all ourselves. We get no help whatever from the municipality for fire protection, for water furnished to the various public buildings, for any service rendered to the municipal department. We get nothing. Therefore, in order to show the citizens what I believe to be the fair condition of the department, each year we make an estimate of the cost to the plant as it stands at the end of the year, allowing for what would be the amount of taxes if it were a private plant based on the full city rate assessed against any private consumer on his property; we charge that off. Then we take credit for water supplied to the city, at no time exceeding the immediate rate charged to the largest consumers; so that the city gets the full benefit of everything that we give to them, and we take as much benefit as we can fairly take under that statement. The question of fire protection has been thoroughly threshed out, because the system is right up to the mark on fire protection, there are no weak points in it at all; and I feel that the rates that are established now, which have just been revised I might add so far as meter charges are concerned, represent the lowest working point that we can adopt for the time being. We have just made a reduction of 14 per cent on the meter charges. Now I mentoined this simply to show that a municipal plant can take account of everything and still show a profit at the end of the year. We have to provide, however, for a possible contingency in the future. The state law of New York, as we are informed by our state attorney, forbids our making a cash charge and collecting actual cash for any service rendered the city. For that reason we have to make an assessment charge which we do not report as an actual cash item, but simply show as an addendum to our financial report, in order to give the public the correct idea of what the department stands for in its expenses. Our flat rates are 10 per cent lower than those charged by the old private company and the meter rates are about 40 per cent less than those charged by the private company formerly; yet, as I say, we show a profit after accounting for everything.

Degree of Purification of Sewage by Screens and Grit Tanks and Methods and Costs of Purifying Sewage to Higher Degree Than by Fine Screens.*

QUANTITY OF ORGANIC MATTER REMOVED BY SCREENS AND GRIT TANKS.

By passing the crude sewage through gratings or sieves, a quantity of floating and suspended organic matter is removed which varies with the size of the openings. In most cases such screens have been applied mainly to prevent injury or stoppage of pumping machinery, for which purpose a grating formed of bars spaced about 1 in. apart is generally sufficient. Latterly, however, it has been found very desirable to remove as much of the floating and suspended matter as practicable by means of much finer gratings or screens, since a large proportion of this matter is stable or slowly putrescible and tends to accumulate in the interstices of costly filters, whence it must be removed periodically at large expense. The modern process of purifying sewage may therefore be said to consist essentially of two distinct stages, the first being the removal of the suspended matter, while the second is the oxidation of the putrescible organic matter in solution.

In general it may be said that the suspended matter imparts to sewage its offensive appearance and causes the serious complaints about the pollution of natural water courses. The quantity of such matter contained in sewage varies widely in different places, and also at different seasons, days and hours in the same place. The variation in quantity and quality during 24 hours is well exhibited in the report of Messrs. Hazen and Whipple on the sewage of Paterson, N. J., made in 1906, which shows that at a number of different points in that city the dried suspended matter ranged from 45 to 641 parts by weight per million. Similarly, in the report on the purification of the sewage of Columbus, O., made in 1905 by George A. Johnson, C. E., it is shown from daily analyses extending over a period of ten months that the dried suspended matter ranged from 12 to 842 parts per million, with an average of 209 parts. Much of this suspended matter, however, is of mineral character, the average for Columbus being 130 parts of mineral to 79 parts of dried organic substance.

A large proportion of the mineral matter in sewage is so finely divided that it does not settle readily, and hence only the particles that are more than 0.01 in. in diameter are usually caught in detritus tanks. With respect to the quantity of grit collected in such tanks, comparatively few data are available. At Manchester, England, such deposit varies from 8 to 12 cu. ft. per million U. S. gallons. In Paris, France, it was at the rate of 14.3 cu. ft. in 1897, and nearly as much more was removed from the sewers directly. At two of the sewage pumping stations of Berlin, Germany, it was at the rate of 4.8 cu. ft. in 1900. At Wiesbaden the rate was 10.1 cu. ft. in 1902. At the Dorchester sewage pumping station in Boston, Mass., it was 8.4 cu. ft. during 1903, while at the experiment station of the Massachusetts Institute of Technology in the central part of Boston, it was 16.5 cu. ft. in 1906. The average of these figures is 10.7 cu. ft. per million gallons of sewage. This grit varies in weight from 95 to 117 lbs. per cu. ft. and contains more or less organic matter and water or moisture.

Taking the average weight at 107 lbs. per cu. ft., and assuming that the mass contains 27 per cent or 29 lbs. of moisture, according to some determinations, it will be found that the quantity of dried suspended matter thus caught in said grit tanks is about 835 lbs. per million gallons, or 100 parts by weight per million. This is more than one-third of the average quantity of dried suspended matter contained in the sewage of several American cities, according to the chemical analyses; and hence it follows that merely with detritus tanks properly designed and operated, a very appreciable degree of sewage purification can be effected.

The quantity of suspended matter that can be removed from sewage by screening has usually been regarded as insignificant, owing to the relatively large width of the spaces between the bars of the gratings ordinarily used. Thus, at the sewage pumping station at Providence, R. I., the matter collected on a grating whose bars are 1 in. apart was at the rate of 41 lbs. per million gallons in 1906; at the Dorchester sewage pumping station in Boston such rate was 300 lbs. in 1897, with a similar spacing; at the sewage pumping stations of the South Metropolitan systems, with the grating bars spaced 0.75 in. apart, the average rate during the four years 1905-1908 was 5.4 cu. ft. or about 324 lbs.; at the Northern Outfall works of the London sewers, it was 243 lbs. with a similar grating in 1897; at the various sewage pumping stations of the Berlin sewerage system, the rate in 1900 was 212 lbs. with bars spaced 0.6 in. apart; and at Charlottenburg it was about 200 lbs. in 1902. It should be noted that in some cases the figures were given in cubic feet instead of pounds, and that much depends on the extent to which the screenings are drained before being weighed.

In general it is found that with the usual coarse gratings at sewage pumping stations, the quantity of suspended matter arrested is from 3 to 10 cu. ft. per million gallons, and that such matter in its wet state ranges in weight from 20 to 65 lbs. per cu. ft. On being

*From Notes in Sewage Disposal, supplementing the Report on the Disposal of the Sewage of the City of Rochester, N. Y., made Feb. 1, 1907, by E. Kuichling, M. Am. Soc. C. E., Rochester, N. Y.

completely dried, it loses from 50 to 75 per cent of its weight, so that on the average it can be assumed that such coarse screenings removes about 104 lbs. of dried matter per million gallons, or about 12.5 parts by weight per million. Most of this matter is organic and more or less quickly putrescible in character; and in comparison with the total quantity of dried organic substance found in suspension in the sewage of American cities, it is still very appreciable in magnitude, particularly when its offensiveness is taken into consideration.

The trouble incidental to the handling of sewage sludge and the application of crude sewage to land, gravel and beds of broken stone, have gradually led to the endeavor to remove as much of the suspended matter as possible by mechanical means before proceeding with any further treatment. Attention has therefore been directed to the development of a satisfactory system of fine screening, whereby sewage purification will be facilitated and rendered less expensive. In 1898 experiments were made at Leeds, England, with zinc plates perforated with ⅛ in. holes, resulting in obtaining a rate of 36 cu. ft. of well-drained matter per million U. S. gallons during the day time. Its weight is not given, but from other observations it can be taken at 30 lbs. per cu. ft.

Similar results were obtained at Wiesbaden, Germany, during 1902, by passing the sewage of the entire city through a set of three screens having clear openings of respectively 0.60, 0.16 and 0.04 in. The matter thus collected amounted to 36.6 cu. ft. per million gallons on the average. In 1904 the screens were remodeled so as to pass the sewage successively through a set of four screens having openings of 1.60, 0.60, 0.10 and 0.06 in., from which 52.7 cu. ft. of matter per million gallons was obtained on the average. Experiments were also made by Riensch at Dresden in 1906 with a large revolving screen of sheet metal perforated with slots 0.08 in. wide, and it is stated that the collection therefrom has averaged 23.07 cu. ft. per million gallons during continuous service. This screen is a circular disk 15.1 ft. in diameter, which is inclined 15° from the horizontal so as to submerge about half of its surface.

A similar device was introduced in several English cities many years ago by Latham, the disk being about 9 ft. in diameter and set vertically. The triangular spaces between the cast iron spokes were closed with wire-cloth having meshes about 0.4 in. square, and the wheel was slowly rotated in an enlarged section of the outlet sewer. At Coventry the collection by such an apparatus was reported to be from 250 to 300 lbs. per million gallons. About twelve years ago another style of screen, formed of an endless belt of wire-cloth with meshes about 0.25 in. square, was invented and erected at a number of other English sewage works. In 1899 a device of this kind extracted suspended solids from the sewage of Sutton at the rate of about 1,200 lbs. per million gallons, and in 1904, a similar apparatus with meshes, 0.4 in. square extracted at Göttingen, Germany, matter at the rate of 336.6 lbs. or 14.7 cu. ft. per million gallons. From the last mentioned figures, the well-drained matter thus collected is found to weigh about 23 lbs. per cu. ft.

An interesting experiment was made in 1906 by City Engineer Mezger in a German town of 50,000 inhabitants (probably Bromberg) with a wire-cloth screen having meshes only 0.06 in. square. The whole of the sewage was passed through the apparatus, and the rates of collection were observed hourly, both when the screen was kept stationary and when it was moved like an endless belt in the outlet sewer. When kept stationary, the maximum collection in one hour was at the rate of 13,770 lbs. per million gallons; during four consecutive hours the rate was 9,514 lbs.; during 24 consecutive hours it was 5,007 lbs., and the minimum rate in one hour was 207 lbs. per million gallons. When the screen was moved through the sewage at velocities ranging from 0.5 to 2.0 ins. per second, the collection was about 14 per cent less during the four hours of greatest flow in dry weather. No determinations of the weight of the extracted matter per cubic foot were recorded, as it was found to vary considerably at different hours, and hence only the total weights per hour were given. If, however, it be assumed that the weight of said matter was 23 lbs. per cu. ft., as found at Göttingen, then the average quantity during 24 hours would be at the rate of 217.7 cu. ft., or about 8 cu. yds. per million gallons.

Other highly instructive observations on the quantity of suspended matter in town sewage that can readily be extracted by fine screens, have been made during the past two years at the sewage works of Reading, Pa. The crude sewage is here mostly domestic in character, and contains little admixture of trade wastes and no street washings, as the latter pass through a separate system of drains into the river without any treatment. The screen is a revolving horizontal cylindrical frame, 16 ft. long and 6 ft. in diameter, covered with brass wire-cloth having meshes about 1-40 in. square which is considerably finer than has heretofore been employed for the purpose. The quantity of solid matter thus collected is reported in *Engineering Record* of Dec. 26, 1908, as being 18.8 cu. ft. per million gallons on the average, but its weight and percentage of contained moisture is not given. On a visit to the plant last year, the writer was informed that the weight of the screenings, after partial drying in a centrifugal separator, was 1,500 lbs. per million gallons. This would make the condensed mass weigh 80 lbs. per cubic foot, of which probably 50 per cent is moisture. If these figures are correct, the screen actually removed 750 lbs. of fully dried matter per million gallons of sewage, or 90 parts per million by weight out of a total of 215 parts per million of suspended matter contained in the sewage on the average.

A similar reduction to parts of dried substance per million may now be applied to the figures relating to Coventry, Sutton, Göttingen and Bromberg, given above in paragraphs. Assuming that the well-drained screenings contain 75 per cent of moisture, the quantity of fully dried matter extracted per million gallons of sewage will be as follows: At Coventry 62.5 to 75 lbs.; at Sutton, 300 lbs.; at Göttingen, 84.2 lbs. and at Bromberg, 1,251.8 lbs. In parts per million by weight these figures correspond respectively to 7.5, 9.0, 36.0, 10.1 and 149.9, while at Reading it was estimated at 90.0. For the observations with fine screens at Leeds, Wiesbaden and Dresden, a similar reduction to parts per million by weight, on the assumption that the wet screenings weigh 30 lbs. per cu. ft. and contain 75 per cent of moistures, gives respectively 270.0, 274.5, 395.2 and 177.8.

During the elaborate investigation of the sewage of Columbus, O., in 1904-5, the liquid examined was passed through a screen having meshes 0.5 in. square, placed in the main outlet sewer parallel with the line of flow to facilitate its cleaning. The report states that this screen "never became clogged sufficiently to require attention. Considerable coarse material which passed through this screen was caught by the screens in the screen-chamber, necessitating the cleaning of these screens from five to six times each day. About 300 lbs. or 0.17 cu. yd. of wet screenings were thus removed on an average per million gallons of sewage." These screens are described as being two in number, set vertically near the outlet end of the chamber, and formed of "diamond mesh wire-cloth woven with No. 12 wire. The first screen had a clear opening of 0.5 in., and the second of 0.375 in." From these data, the wet screenings amounted to 4.6 cu. ft. per million gallons, and weighed 65.4 lbs. per cu. ft.

Their content of moisture is not given, but assuming the same at 75 per cent, the screenings will represent the removal of 9.0 parts per million of fully dried matter, mostly organic and offensive in character. It must also be remembered that these figures relate to the remainder left after preliminary screening, and do not indicate the proportion that would be removed if the entire volume of sewage had passed through a screen with meshes ⅜-in. square.

It is also of interest to ascertain the nature of the solid matter in crude sewage that is arrested on screens having different sizes of mesh. The most careful analysis of this kind was made by Dr. Monti in 1901 with the sewage of two densely populated districts of Berlin (Radial Systems V and VII), using the liquid that had passed through the detritus tanks and gratings at the two sewage pumping stations. The bars of these gratings were spaced 0.6 in. apart, but the quantity of matter removed thereby during his investigation was not determined. The municipal reports for 1900 give the aggregate amount removed during the year by the gratings at all of the thirteen stations, together with the pumpage, and from these figures an average of 10.62 cu. ft. of wet screenings per million gallons is deduced. This matter weighed 20 lbs. per cu. ft. and contained 56 per cent of moisture on the average. By reducing to fully dried substance, the proportions are 93.5 lbs. per million gallons, or 11.2 parts by weight per million. It can also be presumed that these figures would be at least doubled for the most populous districts.

As already stated, Monti dealt only with the screened and partly settled sewage. After mixing together samples taken at different depths in the pump well, he caused the liquid to pass through series of five wire-cloth sieves having meshes respectively 7, 4, 2, 1 and 0.5 millimetre wide (or approximately 0.28, 0.16, 0.08, 0.04 and 0.02 in. square), and also determined the total suspended matter by filtration. He found that on the average his series of sieves extracted only 13.3 per cent of the total dry suspended matter at the first pumping station, and 14.0 per cent at the second, the proportions previously removed by detritus tank and grating not being considered. As to the character of the material caught on his sieves the following brief notes are submitted:

The 7 mm. sieve (0.28-in.) caught mainly fecal matter, and large fragments of paper, cloth, vegetables, leaves, wood, etc.

The 4 and 2 mm. sieves (0.16 and 0.08-in.) caught mainly smaller fragments of vegetables leaves, bits of wood, large seeds, etc., or kitchen wastes.

The 1 mm. sieve (0.04-in.) caught mostly pulp-like matter which increased in volume on drying, and consisted of vegetable debris, cotton, linen and wool fibers, hair and muscular tissue.

The 0.5 mm. sieve (0.02-in.) caught matter of the same character as the 1 mm. sieve, but of finer grain.

On drying and weighing the suspended matter caught by the sieves and the filter at the two pumping stations, Monti obtained the following results expressed in parts by weight per million:

At Station V, caught on the 5 sieves	97
At Station V, remaining on the filter	633
At Station V, total suspended matter	730
At Station VII, caught on the 5 sieves	35
At Station VII, remaining on the filter	215
At Station VII, total suspended matter	250

also the following average and maximum proportions of dried, suspended matter caught by each sieve, expressed in percentages of the total thus caught at the two stations, together with the percentages of moisture in the several screenings:

Size of Sieve	7 mm	4 mm.	2 mm	1 mm.	0.5 mm
Av. both stations	43.6	4.0	1.1	9.0	32.0
Max. both stations	68.0	7.0	1.7	14.0	51.0
Per cent moisture	75-78	75-80	75-80	85-90	90-95

These data indicate that most of the suspended matter in sewage is usually in a very fine state of division or capable of passing through a sieve having meshes 0.02 in. square; that most of the solid fecal matter found in the liquid can be arrested on a sieve having meshes 0.25 in. square; and that a sieve with meshes 0.10 in. square is probably fine enough to extract from the sewage all suspended matter of appreciable magnitude, and especially such as is likely to become offensive under the conditions herein proposed for the disposal of the sewage of Rochester. It should also be noted that the method of determining the total quantity of suspended matter by filtration, as adopted by Dr. Monti, often leads to including much gelatinous or

colloidal substance which may add considerably to the weight on being dried, and thus tends to reduce the percentage of solid material removed by fine screens. Another significant feature is the apparent slow putrescibility of the pulpy matter caught by the two finest screens.

Many experiments have found that on transplanting small fragments of solid organic matter from sewage to a culture medium, a great multitude of bacteria is always carried along. This indicates that these micro-organisms tend to adhere to the suspended matter, and hence that a very appreciable reduction in the number of bacteria in the sewage must result from screening through a sieve having meshes 0.10 in. square.

The data given in the foregoing paragraphs relating to the efficiency of fine screens were obtained only after searching a wide range of scientific literature, as few plants of this character have yet been installed and their performance adequately studied. It is believed, however, that ample evidence has been submitted to show that a surprisingly large quantity of offensive organic matter can be extracted from sewage by properly designed screening appliances, and that the screened liquid may then be admitted safely for final disposal into bodies of water which would soon become repulsive without such screenings. It is also obvious that the cost of this operation is much less than that of sedimentation in large tanks, with the attendant difficulties of getting rid of the resulting sludge and no commensurate improvement in the general character of the effluent.

METHODS AND COSTS OF PURIFYING SEWAGE TO HIGHER DEGREE THAN BY FINE SCREENS.

From the hasty reading of recent text books, papers and discussions on the subject of sewage disposal, the majority of inexperienced readers seem to have imbibed the notion that sewage can be purified artificially and inexpensively to so high degree as to make the effluent safe for drinking. This notion is entirely erroneous, as such work has never been accomplished anywhere on a large scale. By comparatively slow filtration through permeable soil an approximation to drinking water can be attained, but it is safe to say that a proposition to supply a community with water for domestic use taken from the underdrains of a sewage filter or sewage farm, would unhesitatingly be rejected by every sanitarian. Such a supply would be comparable with the water from wells or springs in large cemeteries, which may be clear, but yet contain in solution relatively large quantities of obscure products of decomposition of organic matter, in addition to many bacteria and other micro-organisms.

To accomplish the complete purification of sewage by natural means, much time and space is needed, both above and below the surface of the ground or water. When artificial means are adopted, the attendant expense has hitherto been so great as to render it necessary to be content with a partial purification, much inferior to that attained by the comparatively slow percolation through many feet of sandy soil. Thus at Worcester, Mass., where about two million gallons per day of sewage are filtered through 18 acres of carefully prepared beds of sand, while the remaining ten million gallons per day are treated chemically, in sedimentation tanks, the average percentage of organic matter removed by filtration in 1905 and measured by the amount of oxygen required to complete the process of oxidation, was 87.9, while by the chemical treatment it was 45.4; and at Columbus, O., where about 12,000,000 gals. per day of sewage on the average are applied to broken stone sprinkling filter beds after long preliminary sedimentation in large tanks, such percentage was 67.3 during 1909. These sewage purification works represent the best practice on a large scale to be found in the United States, and there is no pretence whatever that the effluents are fit for drinking.

At Worcester, the crude sewage is applied to the coarse sand filter beds at the average rate of 91,000 gals. per day per acre, but in many other places where the sand is finer, it is necessary to adopt considerably lower rates. During the six years 1900-1905 inclusive, the average yearly cost of operating these filters has been from $6.79 to $13.12, with a mean of about $8.50 per million gallons of liquid filtered. This operating expense does not include the interest and taxes on the cost of the land and construction of the beds, which cost amounted in 1905 to $176,240, or at the rate of $4,900 per acre for a total of 36 acres. Taking such interest and taxes at 5 per cent, and the total quantity of both crude sewage and chemical treatment effluent filtered during 1905 at 1,029,000,000 gals., it will be found that to the aforesaid operating expense a fixed charge of $8.56 per million gallons must be added, thus making the total average cost rate for sewage filtration about $17 per million gallons. The cost of the chemical precipitation of sewage and disposal of the resulting sludge at Worcester was $11.89 per million gallons in 1905, and at Providence, R. I., it was $6.60 in 1906. These two works are the largest of their kind in the United States, and the said costs represent only the operating expenses, exclusive of interest, depreciation and taxes. It should also be noted that at Providence the effluent is discharged into the large body of tidal water called Providence Bay, which requires a much lower degree of purification for the sewage than is needed at Worcester.

The next method of treatment to be considered, is the application of thoroughly sedimented sewage, in the form of spray, to extensive beds of broken stone like macadam, as done at the recently completed sewage works of Columbus, O. This plant is now the largest of its kind in the world, and represents the most advanced scientific mode of partially purifying town sewage. The settled liquid is applied at the rate of 2,000,000 gals. per acre per day, and the cost of the Columbus beds, with the necessary gate house and piping for supply and under-drainage, was about $15,000 per acre for the ten acres now provided. Including the large sedimentation tanks and the land, but not taking into account the long levee for excluding flood water from the adjacent river, and the two small settling basins for the effluent from the sprinkling filters, the total cost of the plant was about $493,100.

As this plant is adapted to deal with a maximum of 20,000,000 gals. of sewage per day, the total cost for construction is therefore at the rate of $24,655 per million gallons per day; and if the fixed charge for interest, depreciation and taxes is taken at 6 per cent, the same will amount to $4.05 per million gallons treated. For the operating expense, no data are yet available, but it probably does not exceed $2 per million gallons, as the sludge from the sedimentation tanks is now simply discharged in its crude state into the Scioto River whenever the water is somewhat higher than normal. If the sludge were to be rendered portable and made available for use on land by means of filter presses, as at Worcester and Providence, the operating expense would be increased about $3, thus making a total cost of at least $9 per million gallons treated.

Reference was made in some of the foregoing paragraphs to the sludge resulting from the sedimentation and chemical precipitation of the suspended matter in sewage. As already stated, all the heavy particles and solids larger than 0.10 in. in diameter are removed by the grit-chambers and screens, and the remaining matter settles slowly in small flakes which do not consolidate. The lower part of the tank is thus gradually filled with such light flakes and coarser particles, whereupon the somewhat clarified liquid above is drawn off, and the watery sediment is removed for further treatment. This semi-liquid mass is called sludge, and from 90 to 95 per cent of its weight is water. It forms in the tanks at various rates depending on the character of the sewage, but in general it may be assumed that from 4 to 6 cu. yds. will be produced per million gallons of American city sewage by plain sedimentation. This was the average rate observed at Columbus, O., during the elaborate experiments of 1904-5. It may also be added that by the use of chemical precipitants the rate is often doubled.

The watery sludge as it comes from the tanks is more or less offensive in odor, and cannot be readily transported or stored. It accumulates so fast in large plants that the utmost ingenuity has been exerted to get rid of it promptly. By means of filter presses or centrifugal separators, the solid matter in the liquid is now usually condensed into a clay-like mass, in which form it can be transported in wagons and used either as a top dressing for cultivated fields, or for filling low places in lands adjoining the plant. After a time, however, the demand for it for such purposes may become exhausted, and the material must then be stored on the nearest available land. There are many sewage works at home and abroad where these accumulations have attained a formidable magnitude, and develop at times highly offensive odors. The sludge thus becomes the most troublesome concomitant of sewage purification processes, and its disposal is often a very serious financial burden.

DISINFECTION OR STERILIZATION OF SEWAGE.

Sewage contains many bacteria and other micro-organisms, but they are usually not such as will produce disease in human beings in consequence of drinking sewage-polluted water. When it contains those micro-organisms which cause disease, it is said to be infected, and the process by which such pathogenic organisms are killed is called disinfection. Many kinds of harmless bacteria and germs are much hardier than the pathogenic ones and survive treatments that destroy the latter, so that sewage may be thoroughly disinfected and still contain a large number of harmless organisms. If the treatment of the liquid is such as to kill all the living organisms contained therein, it is said to be sterilized. There is accordingly a marked distinction between disinfection and sterilization.

When sewage is filtered slowly through fine sand the effluent is never entirely sterile, and may even be infected, although most of the micro-organisms have been removed and the water is clear and sparkling; but when the liquid is only partly purified, as is the case in all the modern processes which have been found feasible without prohibitory cost, the number of bacteria in the final effluent is always large and sometimes is nearly as great as that in the crude sewage. It is therefore an illusion to regard these modern scientific methods of sewage treatment as being capable of producing sterile effluents in actual practice, or even effluents which are free from pathogenic germs. Many studies have accordingly been made to ascertain how such effluents might be either disinfected or rendered sterile at reasonable expense.

The first extensive investigation of the subject seems to have been instituted by the Imperial Board of Health of Germany soon after the outbreak of cholera in Hamburg, and resulted in the recommendation that hypochlorite of lime should be applied to the effluent or sewage, during the prevalence of infectious diseases in a municipality, in sufficient quantity to destroy all bacteria. Subsequently this was found to be impracticable, as the chemical mentioned could not sterilize the liquid completely, but destroyed only those classes of bacteria which are associated with cholera, typhoid fever and certain other infectious diseases. It was also found that if the process were restricted to this end merely, the quantity of chemical to be applied might be greatly reduced, thereby rendering the work feasible from a financial point of view. As the subject now stands, efforts are being made by sanitarians to secure the disinfection of sewage effluents and not their sterilization, or even the removal of all objectionable organic matter.

The present attitude of the most advanced students of the sewage problem has been set forth very clearly by Prof. E. B. Phelps, of the Massachusetts Institute of Technology, in a publication of the U. S. Geological Survey entitled "The Disinfection of Sewage and Sewage Filter Effluents." (Abstracted in ENGINEERING-CONTRACTING for Aug. 11, 1909.)

The writer has made a number of inquiries concerning cost among those who are inter-

ested financially in applying ozone to sewage effluents, and the lowest estimate made was a rate of $10 per million gallons of roughly sedimented sewage for operating expense alone, regardless of interest and depreciation on the cost of the plant. It was also conceded that this price was based only on laboratory experiments conducted on a very small scale, and not on experience with large quantities of real sewage. Assuming that such treatment and price were applied to the estimated average prospective flow of 65,000,000 gallons of sewage and storm water per day at Rochester, the annual operating expense would amount to $237,250, which represents the interest at 5 per cent on a principal of $4,745,000.

In using chlorine for disinfecting water and sewage, the least expensive and most recent method is to employ chloride of lime or bleaching powder, which is composed largely of calcium hypochlorite. This material contains from 35 to 40 per cent of available chlorine and costs at wholesale about $25 per ton. It has long been recognized as a powerful disinfectant and deodorizer, and was used more than fifty years ago to treat the sewage of London before discharging it into the Thames. Subsequently its use as a sewage disinfectant was investigated extensively by the Sanitary authorities of Germany. In the experiments at Hamburg with a chemically clarified sewage effluent, satisfactory disinfection was obtained in ten minutes with from 3 to 4 parts per million of available chlorine, whereas the crude sewage required 25 parts and an exposure of two hours. At the aforesaid price and the latter rate of application, the cost per million gallons of sewage for the bleaching powder alone would be $7.83; and if the labor and apparatus is also considered, the cost would probably exceed $10 per million gallons.

In the experiments at Berlin, the disinfection was directed to destroying the colon bacilli found in the crude sewage. These organisms are regarded as being somewhat hardier and much more numerous than the pathogenic bacteria, whence the inference that the killing of the former is reasonably certain to accomplish the death of the latter. By using bleaching powder for the purpose in various proportions, it was found that with 50 parts of available chlorine per million and two hours' exposure, the colon bacilli were presumably killed in 9 out of 20 samples, while with 150 parts and the same exposure, they were presumably killed in 15 out of 19 samples. These figures indicate some of the uncertainties attending practical disinfection. It may also be noted that in these two series of experiments, the quantity of bleaching powder used was from 2 to 6 times greater than in the case cited near the end of the preceding paragraph.

Numerous other experiments of similar character have lately been made both in our own country and abroad, but to save time and space only those conducted by Prof. Phelps in 1908 will be mentioned. On applying bleaching powder to crude sewage at Boston, Mass., at rates of 2 to 10 parts of available chlorine per million, he found that the total number of bacteria was greatly reduced after an exposure of one hour, but complete sterilization could not be effected; and if the time was prolonged to two hours the number of bacteria increased considerably. With septic tank effluent at Red Bank, N. J., he found it necessary to use 10 to 13 parts of available chlorine per million in order to obtain a liquid containing less than 100 B. coli per cubic centimeter after exposure for 45 minutes. With the effluent from an experimental sprinkling filter at Baltimore, Md., similar results were obtained with from 2 to 3 parts of available chlorine per million after exposure for two hours.

The Western Maryland Ry. is planning for extensive improvements at the water front terminal in Baltimore, Md. The work will include the enlargement of concrete warehouse at a cost of $100,000, enlargement of fireproof piers at a cost of $50,000, and the erection of a 5-story concrete fireproof building at a cost of $100,000.

Railway Section

Note: This section is devoted to methods and costs of constructing railways. It will cover road-bed and track construction, contractor's plant and organization, surveying methods and permanent way structures.

Cost of Operating the Long Island Electric Railway.

The Long Island Electric Ry. Co. was incorporated in 1894, and in 1899 it was merged into the New York and North Shore Ry. Co., which had been incorporated in 1897. The stock is now controlled jointly by the Interborough Rapid Transit Co. and the Long Island Consolidated Electric Co.

The track mileage is as follows:

	Miles.
Road, first track	17.34
Second track	7.90
Total trackway owned	25.24
Sidings, storage track, etc., owned	1.30
Total track owned	26.54
Trackage rights, 1st and 2d track	1.00

From Belmont Park to Brooklyn there are 8.28 miles of road, double track most of the way, laid with 7-in. girder rails. From Jamaica to Far Rockaway there are 9.06 miles of single track on 6-in. girder rails.

On 14.2 miles of the road, span wire construction for the overhead trolley is used; side bracket construction is used for 3.14 miles. All poles are wooden, 52 per mile.

On June 30, 1908, the rolling stock was as follows:

5 closed motor cars, 15 tons (maximum), 40 ft. long, at $3,000.
20 open motor cars, 12 tons, 40 ft. long, at $2,000.
1 open non-motor car.
5 combination motor cars.
6 semi-convertible motor cars, 12 tons, 35 ft. long, at $3,000.

37 Total passenger cars.
3 sweeper cars (motor), at $2,000 each.
1 work car (motor).
1 work car (non-motor).
1 wrecking car (motor).

The average car seated 42 passengers.

The electric power was purchased, so the station equipment consisted only of 2 transformers of 1,100 KW. total capacity, and 2 rotaries of 1,000 KW. capacity. The cost of the two rotary converters was $35,000 in 1907.

The following are the traffic statistics for the year ending June 30, 1908:

Mean number of passenger cars in use	37
Passenger car miles	963,192
Same per mile of all track	36,292
Same per passenger car in use	26,032
Freight, mail and express car miles	20,160
Passenger car hours	91,625
Passenger car miles per car hour (speed)	10.51
Passengers at 5 cts.	3,670,888
Passengers per car mile	3.82

The employees and their wages for the year were:

General Office Staff:
2 General officers.
3 Other officers.
10 Employes.

15 Total General Office $7,044

Transportation:
3 Inspectors.
2 Train clerks and dispatchers.
1 Superintendent.
27 Conductors, at 20 cts. per hr.
27 Motormen, at 20 cts. per hr.
1 Switchman.
19 Road and trackmen.

80 Total Transportation $52,872

Power:
2 Dynamo and switchboard men.
2 Linemen.

4 Total Power $3,935

Car House and Shops:
2 Car cleaners.
1 Heater tender.
3 Car house repairers.
1 Cabinet maker.
1 Machinist.
1 Electrical helper.
3 Other employes.

11 Total Car House and Shops $9,681

113 Grand total $74,532

The operating expenses for the year ending June 30, 1908, were as follows:

Maintenance of Way and Structures:	
1. Track and roadway	$12,537
2. Electric line	4,427
3. Buildings and fixtures	320
Total Maintenance of Way	$17,284
Maintenance of Equipment:	
4. Electric plant	$ 33
5. Cars	6,738
6. Electric equip. of cars	7,383
7. Miscel. equip.	55
8. Shop expenses	2,399
Total Maintenance of Equipment	$16,608
Operation of Power Plant:	
9. Wages	$ 1,765
10. Lubricants and waste	31
11. Miscel. supplies and expenses	37
12. Hired power	32,656
Total Operation of Power Plant	$34,489
Operation of Cars:	
13. Superintendence of transp.	$ 900
14. Wages of conductors	18,219
15. Wages of motormen	18,228
16. Wages of miscel. car service men	4,091
17. Wages of car house employes	869
18. Car service supplies	1,016
19. Miscel. car service expense	6,972
20. Hired equipment	1,098
21. Cleaning and sanding track	706
22. Removal of snow and ice	1,076
Total Operation of Cars	$53,175
General Expenses:	
23. Salaries of general officers	$ 2,960
24. Salaries of clerks	900
25. Printing and stationery	386
26. Miscel. office expense	283
27. Stores expenses	252
28. Stable expenses	245
29. Advertising	40
30. Miscel. general expenses	1,127
31. Damages	6,855
32. Legal expense due to damages	1,858
33. Miscel. legal expense	1,718
34. Rent of land and buildings	190
35. Rent of tracks and terminals	4,100
36. Insurance	1,603
Total General Expenses	$ 22,516
Grand Total Operating Expense	144,041
Taxes assessed	12,485

Since there were 963,192 car miles, the operating expenses were as follows per car mile, summarized:

	Cents per car mile.
Maintenance of way and structures	1.794
Maintenance of equipment	1.724
Operation of power plant	3.581
Operation of cars	5.521
General expenses	2.337
Total operating expense	14.957
Taxes assessed	1.295

The maintenance of track and roadway (Item 1) cost $500 per mile of trackway (25.24 miles), as compared with $560 for the preceding year.

The maintenance of electric line (Item 2) cost $175 per mile of trackway, as compared with $160 for the preceding year. The maintenance of cars and their electric equipment (Items 5 and 6) cost $381 per passenger car, but shop expense (Item 8) amounted to $64 additional expense per car. The average first cost of the cars appears to have been about $2,500 each. Hence the maintenance expense was nearly 18 per cent of the first cost.

The cost of maintaining these same 37 passenger cars during the preceding year (1907) was even greater, being:

Maintenance of cars	$ 7,781
Maintenance of elec. equip. of cars	13,179
Miscel. shop expenses	2,722
Total	$23,682

This is equivalent to $640 per car, and indicates that the cars were in a very run down condition.

There were 3,087,058 KW. hrs. purchased (Item 12) at 1.06 cts per KW. hr. It required 3.20 KW. hrs. per car mile.

Cost of Operating All the Surface Electric Railways in Greater New York City.

In our issue of June 8 we gave the average cost of operating the 75 electric railways in the Second District of New York State, which includes all lines not in Greater New York City. The following data have been compiled from the report of the N. Y. Public Service Commission for the First District for the year 1908. We have excluded the operating statistics of all the elevated and subway lines (Interborough Rapid Transit, Hudson and Manhattan, Brooklyn Union Elevated R. R. Co.), so that the following statistics relate only to the surface lines.

For the operating costs the elevated and subway roads, see our issues of Apr. 13 and 20.

In our issue of May 4 we gave the operating costs of the lines of the New York City Ry. Co., which form a large part (43%) of the following costs. The reader will do well to refer to our issue of May 4 for our critical comments on the operating costs of the New York City Ry. Co. Among other things, we called attention to the exceedingly high costs of equipment and track maintenance, due to the run down condition of the plant. These unusually high expenses obviously affect the averages for the entire First District.

The total mileage under consideration is as follows:

	Miles.
First track, or roadbed	631.16
Second track	521.39
Third and fourth track	2.10
Total trackway	1,254.65
Sidings, turnouts, storage, etc.	88.23
Total track	1,243.18

The Staten Island Ry. and the Staten Island Rapid Transit Co. mileage is not included, for they are operated by steam locomotives.

The equipment was as follows:

Revenue Cars:	
Closed cars, motor	2,311
Closed cars, non-motor	1,404
Open cars, motor	2,686
Open cars, non-motor	36
Combination cars, motor	459
Semi-convertible, motor	685
Parlor cars, motor	5
Mail and express, motor	20
Mail and express, non-motor	19
Freight, motor	107
Freight, non-motor	45
Total revenue cars	7,786
Service Cars:	
Snow plows, motor	36
Snow plows, non-motor	26
Sweepers, motor	126
Sweepers, non-motor	68
Work cars, motor	80
Work cars, non-motor	30
Wrecking cars, motor	28
Other service cars, motor	171
Other service cars, non-motor	15
Total service cars	580
Grand total	8,366

The total number of passenger car miles for the year was 136,087,615, which is equivalent to 117,820 car miles per mile of trackway, or 17,940 car miles per passenger car. Some of the roads did not report the number of car hours, so that the average schedule speed can not be given.

There were 5,417 passenger fares collected per car mile, and practically all were 5 cent fares. The total operating revenue per car mile was 27,005 cents, and the operating expenses per car mile were as follows for the surface electric railways only:

	Costs per car mile.
Maintenance of Way and Structures:	
1. Track and roadway	$ 1.227
2. Electric line	0.445
3. Buildings and fixtures	0.189
Total maintenance of way	$ 1.861
Maintenance of Equipment:	
4. Steam plant	$ 0.108
5. Electric plant	0.051
6. Cars	1.430
7. Electric equipment of cars	1.419
8. Miscellaneous equipment	0.098
9. Shop expense	0.245
10. Renewal of horses, harness, etc.	0.141
Total maintenance of equipment	$ 3.492
Operation of Power Plant:	
11. Wages	$ 0.309
12. Fuel	0.851
13. Water	0.082
14. Lubricants	0.026
15. Miscellaneous supplies	0.034
16. Hired power	0.886
17. Provender and stable	0.323
Total operation of power plant	$ 2.502
Operation of Cars:	
18. Superintendent of transportation	$ 0.380
19. Wages of conductors	2.935
20. Wages of motormen	3.106
21. Wages of miscel. car service men	0.505
22. Wages of car house men	0.416
23. Car service supplies	0.101
24. Miscellaneous car service expense	0.240
25. Hired equipment	0.522
26. Cleaning and sanding track	0.153
27. Removal of snow and ice	0.097
Total operation of cars	$ 8.455
General Expense:	
28. Salaries of general officers	$ 0.167
29. Salaries of clerks	0.233
30. Printing and stationery	0.052
31. Miscellaneous office expense	0.052
32. Stores expense	0.085
33. Stable expense	0.096
34. Advertising and attractions	0.006
35. Miscellaneous general expense	0.109
36. Damages	1.784
37. Legal expense incident to damages	0.530
38. Miscellaneous legal expense	0.148
39. Rent of land and buildings	0.091
40. Rent of track and terminals	0.097
41. Insurance	0.229
42. Undistributed	0.006
Total general expense	$ 3.685
Grand total	19.995

No total is given for the taxes assessed for the year, but the taxes assessed against the New York City Ry. Co. amounted to 2.384 cts. per car mile.

Maintenance of way and structures (Items 1, 2 and 3) amounted to the following per mile of trackway (1,155 miles):

	Per Mile.
1. Track and roadway	$1,446
2. Electric line	524
3. Building and fixtures	223
Total	$2,193

This is an abnormally high cost, even considering the fact that there were 117,820 car miles per mile of track.

The maintenance of the 7,586 passenger cars was as follows per car:

	Per car.
6. Cars (bodies and trucks)	$257
7. Electric equipment of cars	254
9. Shop expenses, prorated	41
Total	$552

Since 36 per cent of the cars were open cars, used only in summer this maintenance cost per car is below what it would be if all cars were in constant use, assuming that the $552 per car is fair annual average. It is, however, considerable above a fair average, due to the previous run down condition of much of the equipment. Unfortunately, neither the average weight of the cars, nor a statement, as their first cost is given, so that accurate deductions from the maintenance data are impossible.

Items 4 and 5 give no definite information, for item 16 shows that a large percentage of the electric power was purchased.

Item 10, renewal of horses, exists because about 5% of the total surface car mileage in New York City is still horse-car mileage. There were 2,579 horses in use, most of them on the New York City Ry. Co. lines.

Items 36 and 37, damages, are enormous, being more than double the amount per car mile on the electric railways of the Second District of New York.

The operating ratio is 19.995÷27.005=74%.

Table I gives a summary of the operating expenses for the different sections of the First District, both for surface and for subway and elevated lines.

The abnormal character of the surface line maintenance expenses for 1908 is well shown by the following car mile costs for the Manhattan surface lines during 1907 and 1908.

	1907.	1908.
Maintenance of way, etc.	$ 1.63	$ 2.43
Maintenance of equipment	2.81	4.77
Operation of power plant	1.42	2.24
Operation of cars	8.71	9.21
General expenses	5.11	4.20
Total	$19.68	$22.85

LETTERS TO EDITORS.

A Simplification of the "Criss-Cross Method" for Computing Cross-Section Areas.

Sirs: While calculating a large number of irregular cross-section areas by the "criss-cross method," I found the following a much easier and shorter way. Given the cross-section notes:

By the ordinary criss-cross method, 18 multiplications are necessary to calculate the area, viz.:

Area = ½ [h'$_4$b + h'$_3$d'$_4$ + h'$_2$d'$_3$ + h'$_1$d'$_2$ + h$_0$d'$_1$ + h$_0$d$_1$ + h$_1$d$_2$ + h$_2$d$_3$ + h$_3$d$_4$ + h$_4$d$_5$ + h$_5$b—(h'$_4$d'$_3$ + h'$_3$d'$_2$ + h'$_2$d'$_1$ + h$_2$d$_1$ + h$_3$d$_2$ + h$_4$d$_3$ + h$_5$d$_4$)].

Adding the products we have:

Area = ½ [h'$_4$ (b—d'$_3$) + h'$_3$ (d'$_4$—d'$_2$) + h'$_2$ (d'$_3$ -d'$_1$) + h'$_1$d'$_2$ + h$_0$ (d'$_1$+d$_1$) + h$_1$d$_2$ + h$_2$ (d$_3$-d$_1$) + h$_3$ (d$_4$—d$_2$) + h$_4$ (d$_5$—d$_3$) + h$_5$ (b—d$_4$)].

In words: To obtain the area of an irregular cross-section:

(1.) Multiply the cut (or fill) at the slope stakes by one-half of the width of the roadbed minus the distance of the adjoining cut (or fill).

(2.) Multiply each intermediate cut (or fill) by the difference of the distances of the adjoining cuts (or fills).

(3.) Multiply the center cut (or fill) by the sum of the distances of the adjoining cuts (or fills).

(4.) Add the products and divide by two.

As will be seen, there are only as many multiplications necessary as there are cuts (or fills) given in the notes. Care has to be taken in using the alegbraic signs. In the above example if b(=½ roadbed) is greater than d'$_3$ or d$_4$, the products are +; if smaller, —. A little practice will show the great advantage of this simplification.

I saw this short method in none of the engineering handbooks nor in other publications, and found it very little known among engineers. I therefore believe that it would be for the benefit of many of your readers if you would publish it in your paper.

Yours respectfully,

O. C. KULICKA.

Pauls Valley, Okla., June 8, 1910.

TABLE I.—EXPENSES OF OPERATION PER REVENUE CAR MILE OPERATED (IN CENTS).

Company.	Total.	Maintenance of way and structures.	Maintenance of equipment.	Operation of power plant.	Operation of cars.	General.
Hudson & Manhattan R. R. Co.	37.120	6.023	3.067	12.569	10.590	4.871

*Including wages of enginemen and operating and fuel costs of locomotives.

Queries as to Practice in Cost Plus a Fixed Sum Contracts.

Sirs: Will you kindly answer the following question? Under a contract where the contractor is furnishing the hand tools and being paid a commission on the cost of the work should the contractor pay a blacksmith to sharpen and maintain such tools? What is the general custom on percentage work? In this case the only clause that bears on the matter reads as follows:

That he will at his own expense, furnish all ordinary hand tools and implements, such as shovels, wheelbarrows, picks, crowbars, drills, hammers, and all other tools of similar nature, necessary or proper for the performance of the work herein provided for.

By giving your opinion on this matter you will do me a great favor.

Very truly,
A. A. W.

Hilo, Hawaii, April 29, 1910.

Sirs: Will you kindly advise the writer concerning contracts where a contractor agrees that the cost of a certain piece of work would be say $10,000 and agreed to do the work for the amount plus a bonus of $500; the contractor to receive an additional bonus of 15 per cent on any amount that he may save under the price named—$10,000—and if the cost exceeded the price named, then 15 per cent of the amount over and above the $10,000 is to be deducted from his bonus.

Under such a contract is it customary and proper for the contractor to include in his items of cost ($10,000) board for his men, building of a bunk house, equipping same, grub for men, cook, hiring of plant, cost of tools, railroad fares, traveling expenses, such as tips, hotel bills, etc.?

We ask these questions, with a view of learning the exact status and customs among contractors who work on these lines.

Very truly yours,
C. H. E.

Philadelphia, Pa., May 21, 1910.

(The editors would like to have answers from the readers of ENGINEERING-CONTRACTING to these questions.—Editors.)

The Standard Bag of Cement.

Sirs: I note in a recent issue of your Engineering-Contracting that the subject of the Standard Bag of Cement has been up for consideration and it has been suggested either that the present standard bag of cement of ninety-four pounds be adopted, or that some new standard, such as one hundred pounds should be adopted and that it be called a cubic foot.

In discussing this matter, it seems to me that some reference should have been made to the action of the Organization of City Officials for Standardizing Paving Specifications. This Organization recommended the use of the present bag, weighing ninety-four pounds, as the standard unit for cement measurement and based all of their specifications in regard to concrete on this unit.

It seems to me that the size of the cement bag is fairly well fixed and that it would be advisable for other engineers, as well as city engineers, to follow the line laid out by the city engineers and make use of the present bag of cement as the unit of measurement.

Yours very truly,
J. H. WEATHERFORD,
Chairman Cement, Concrete & Concrete Pavement.

Memphis, Tenn., May 25, 1910.

Formula for a Waterproofing Paint for Concrete.

Sirs: In your valuable number of April 27, 1910, an article by C. H. Cartlidge mentioned a method of waterproofing by a paint, made of coal tar, Portland cement and kerosene which was recommended highly, as it can be applied to concrete, which may be wet or dry. The writer desires to know the formula for this paint, as he is doing a great deal of concrete wall work in a wet district, and thinks it would be a great help to him. Any information on the above would be thankfully received.

Yours very truly,
F. D. & SONS

Chicago, Ill., June 2, 1910.

(The above query has been referred to Mr. Cartlidge, who has sent us the following reply.—Editors.)

Sirs: Replying to your letter of June 15th: The formula for the tar paint referred to in my paper on concrete trestles was taken from the "Engineering News." I do not recall the date of publication. The formula is as follows:

Coal tar, 16 parts; Portland cement, 4 parts, and kerosene oil, 1 part; all by volume.

The Portland cement and kerosene oil are mixed; the coal tar is heated until thinly fluid, and the mixture of cement and oil stirred in. Upon cooling the paint should be thin enough to flow under a brush, and is applied as any ordinary paint. If because of cold weather or too heavy a tar the paint should be thick, it is well to add more kerosene oil, but this should only be done after heating the paint. Care should be taken to use a good quality of refined tar. It is my personal opinion that the crude commercial coal tar obtained from gas manufacturers does not make as good a paint as the better grades of tar. Our practice on the C., B. & Q. road is to specify "Barrett's" refined tar for this purpose

Yours truly,
C. W. CARTLIDGE.
Bridge Engineer.

Chicago, Ill., June 16, 1910.

Personals.

Mr. E. S. Dunbar, Oroville, Cal., has been appointed Chief Engineer of the Butte & Plumas Ry., which projects a 30-mile line from Oroville to Stanwood, Cal.

Mr. E. L. Cousins, Resident Engineer of the Middle Division of the Grand Trunk Ry., has been engaged as Assistant Engineer of the City of Toronto on special work.

Mr. R. H. Howard, Chief Engineer in charge of maintenance of way of the Chicago & Eastern Illinois at Chicago, has resigned to accept a position with an eastern road.

Mr. A. A. Meyers, an Engineer of the Department of Public Works of the Netherlands, is now in this country studying methods of water storage in the interests of the rice and sugar industries in Java.

Patrick J. Burke, a pioneer in electric railway construction and a member of the Old-Time Telegraphers' Association, died recently at his home in Cheshire, Conn., aged 64 years. In early life he built telegraph lines in New York state, Missouri and other sections of the country.

Prof. L. G. Carpenter, for many years connected with the Colorado Agricultural College as head of the irrigation engineering department and director of the experiment station, has resigned his position as director of the station. He will remain with the college, however, as professor of irrigation engineering.

Mr. Guy R. Johnson, formerly Vice-President of the Alabama Consolidated Coal & Iron Co., and Mr. Blair Hughes, formerly Engineer Maintenance of Way of the Seaboard Air Line Ry., have entered into a partnership under the firm name of Johnson & Hughes and will engage in a general building and structural engineering business. The offices of the firm are in the Brown-Marx building, Birmingham, Ala.

Capt. A. H. P. Desborough, an Imperial government expert at Woolwich Arsenal, England, has also been engaged, with the consent of the Colonial office, to come to Canada for a couple of months to advise the Department of Mines as to the best regulations to adopt in Canada respecting the manufacture, storage and use of explosives. He will also give the department the benefit of his experience in connection with a government explosives testing station to be established here.

Mr. Charles E. Goad, a civil engineer, died June 10, at his home in Toronto, Ont. Mr. Goad, who was 62 years of age and a native of London, England, came to Canada 40 years ago and became well known by the preparation of fire insurance plans and maps for all the municipalities in Canada. Subsequently this work was largely extended and offices established in London, England, and South Africa. Mr. Goad also had offices in Montreal and at 15 Wellington St West, Toronto.

Mr. Lucius I. Wightman, for the past six years Advertising Manager for the Ingersoll-Rand Co., 11 Broadway, New York, has resigned his position, the resignation taking effect Aug. 1st. He will open an office in New York City as an independent specialist in machinery advertising, handling the accounts of manufacturers of machinery and engineering products. Mr. Wightman is a graduate engineer and has had much experience in practical, mechanical and electrical engineering, construction work, machine design and manufacture and machinery selling. He is the author of a text-book on compressed air, and is one of the authorities on compressed air subjects.

The U. S. Civil Service Commission, Washington, D. C., will hold an examination on July 20-21 at various cities throughout the country to secure eligibles from which to make certification to fill vacancies as they may occur in the position of United States Surveyor in the General Land Office, and other vacancies as they may occur in any branch of the service requiring similar qualifications. The entrance salary is $100 per month, traveling expenses, and subsistence while in the field. Promotions are made after satisfactory service. In the southern states employment is usually continuous, but in the northern states persons are frequently dropped during the winter months. Those who give satisfaction to the department are furloughed when conditions require a stoppage of work, but may be re-employed the next spring immediately and without further examinations.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

The Clark Meter Box.—Paper, 6x9½ ins. H. W. Clark Co., 115 South 17th St., Mattoon, Illinois.

A catalog of a housing for water meters. Shows various styles and gives complete descriptions and prices.

Traveling Electric Cranes.—Paper, 7¾x10½ ins.; 28 pp. Pawling & Hernischfeger Co., Milwaukee, Wis.

A catalog of illustrations of some of the Traveling Electric Hoists built by this firm for various classes of service.

Beams and Columns.—Cloth, 3½x6 ins. Northwestern Expanded Metal Co., Old Colony Building, Chicago, Ill.

Contains tables of strength and carrying capacities and formulae for the design of reinforced beams and column.

American and New Niagara Water Meters.—Paper, 4x9 ins.; 16 pp. Buffalo Meter Co., 290 Terrace, Buffalo, N. Y.

A complete meter catalog, well illustrated and with good description. Contains tables of dimensions and prices.

Lifting Jacks.—Paper, 4x9¼ ins.; 96 pp. The Joyce-Cridland Co., Dayton, O.

This is a valuable catalog containing cuts and descriptions of all classes of jacks with prices for the different kinds and for their parts.

Expanded Metal Lath.—Paper, 6x9 ins.; 16 pp. **Expanded Metal—System of Steel Concrete Construction.**—Paper, 6x9 ins.; 32 pp. The Expanded Metal Engineering Company, 1182 Broadway, N. Y.

The first mentioned booklet contains information regarding the various uses to which the lath is put, on ceilings, walls, fences, partitions, etc. The second describes the use of the metal where bearing area is to be provided as floors, etc. Tables of meshes and tables for calculations of spans are given.

The Milwaukee Concrete Mixer.—Paper, 6x9 ins., 24 pp. The Milwaukee Concrete Mixer & Machinery Co., Milwaukee, Wis.

A catalog giving cuts of all styles of concrete mixers made by this company, with descriptions and prices.

Barrett's Creo-Carbolin.—Paper, 7x8 ins., 24 pp. Barrett Manufacturing Co., New York, N. Y.

A catalog describing the uses and showing the applications of this wood preservative and stain.

Gas Compressors.—Paper, 6x9 ins., 32 pp. Ingersoll-Rand Co., 11 Broadway, New York, N. Y.

A catalog illustrating the different machines and parts, and describing in detail the compressors shown.

Wire Rope News.—Paper, 8½x11¼ ins., 16 pp. American Steel & Wire Co., Chicago, New York, San Francisco.

This publication is for May, 1910, and contains some interesting articles. It also has new price lists and new figures on the breaking strength of wire rope based on actual tests.

Tarvia.—9x6 ins., 40 pp. Barrett Manufacturing Co., New York.

A book of illustrations with some descriptive matter, entitled, "Good Roads—How to Build, Preserve and Make Dustless."

Reinforced Concrete Pipe.—Paper, 9¼x12 ins., 76 pp. Reinforced Concrete Pipe Co., Jackson, Mich.

A general catalog with complete descriptions, tests and photographs of this pipe in its various applications.

Contract News Section

of

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The U. S. Senate on June 15 passed the House Bill authorizing the withdrawal of public land. The bill carries an appropriation of $30,000,000 for the completion of irrigation projects. ——The first train over the newly completed Grand Trunk Pacific Regina-Yorkton branch reached Yorkton, Sask., on June 15.—— Through passenger and freight traffic from Salt Lake City and Los Angeles and the east over the San Pedro, Los Angeles & Salt Lake R. R. was resumed on June 12, after an interval of five months spent in repairing the damages to the system resulting from a disastrous washout.——In order to make improvements both in the physical properties and rolling stock, the Missouri, Kansas & Texas R. R. is making plans to float several bond issues to finance the schemes of betterment. The first bond issue will be for $10,000,000. This will be a part of a bond issue of $125,000,000, which has been planned and for the ratification of which a meeting of the stockholders has been called for July 30.—The drainage of the Florida Everglades will soon become a reality for the State Board of Drainage Commissioners have awarded a contract to the Furst-Clark Construction Co., Baltimore, Md., for the construction of 184 miles of drainage canals and contracts involving 19,013,496 cu. yds. of excavation. Bids for this work were opened June 15 at Tallahasee, Fla.——One of the largest municipal contracts of the week was the one secured by the Ryan-Unmach Co., New Haven, Conn., from the city of Waterbury, Conn. This contract was for the construction of a storage reservoir dam, the work including: Concrete masonry, 25,600 cu. yds.; concrete masonry, 5,000 cu. yds.; concrete blocks, 2,960 cu. yds.; rolled embankment, 525,000 cu. yds.; crushed stone, 5,900 cu. yds.; paving, 8,900 cu. yds.; loaming on dam, 6,300 cu. yds.; loaming adjacent areas, 5,000 cu. yds. sodding, 18,840 cu. yds.; drain gate house complete, exclusive of foundation; service gate house complete.—— An aeroplane flight from New York to Philadelphia, Pa., and return was made on June 13. The total time in the air was 3 hours and 34 minutes. The trip from Gouvernors Island New York, to Philadelphia, 86 miles, was made in 1 hour and 50 minutes. The average speed going was about 47 miles per hour and an average speed returning was about 51⅓ miles per hour.——During the month of May the excavation on the Panama Canal amounted to 2,477,648 cu. yds. The amount of concrete placed was 107,043 cu. yds. as against 96,120 cu. yds. in April.——The Interborough Rapid Transit Co., New York City, has again applied to the State Public Service Commission for permission to third track its elevated structures in New York City. The company proposes to expend $30,000,000 on the work. ——The chief feature in structural steel work of this week was the opening of bids on June 15 by the Isthmian Canal Commission for building and erecting lock gates for the Panama Canal. The contract calls for about 60,000 tons of steel. There will be 46 mitering gates of two leaves each. The locks on the canal will be located at Gatun, Pedro Miguel and Miraflores. There will be 10 locks at Gatun, 6 at Pedro Miguel and 7 at the last named place. The locks will be 130 ft. wide and each gate 65 ft. wide, and nearly 7 ft. thick. The McClintic-Marshall Construction Co., Pittsburg, Pa., was the low bidder at $5,374,474.——Among the recent railroad construction contracts are the following: G. F. Bristol, Grand Rapids, Mich., sub-contract for about 5,000 cu. yds. of concrete bridge work on the Ohio Electric Ry., near Middletown, O.; The O'Boyle Construction Co., Ltd., Sault Ste. Marie, Ont., for completing roadbed and tracklaying on the Algoma Central from Mile 69 to Mile 170; Crosby, Willis & Welch, Cowley, Wyo., sub-contract for constructing the Burlington branch line from Scribner, Wyo., to Fromberg, Mont., 55 miles.

Levee Work in the South.

It will be a surprise to some to know that nearly $5,000,000 has been spent in the past two years in levee construction in Arkansas and Louisiana. According to the recently issued report of the Board of State Engineers of Louisiana for the period from Apr. 20, 1908, to Apr. 20, 1910, the contracts and agreements for levee work undertaken during the past two years by the state and the several levee districts, with 45 contracts entered into prior to April 20, 1908, numbered 238, involving the handling of 19,875,733 cu. yds. of earth and were estimated to cost $4,722,001.49. The amount and cost of levee work actually performed under those contracts and not taking into account percentages retained until completion during the two-year period by the state and the levee districts and that done by the United States Government is: By the state, 29.78 miles of new levee, 28.3 miles of enlarged levee—involving 3,350,111 cu. yds. of earth, at a cost of $699,701.55. By the levee districts, 64.25 miles of new levee, 57.36 miles of enlargement—involving 9,217,868 cu. yds., at a cost of $2,430,077.90. By the United States, 14.87 miles of new levee, 44.54 miles of enlargement—involving 4,207,722 cu. yds., at a cost of $1,003,982.51. This totals 108.90 miles of new levee, 130.20 miles of enlargement—involving 16,775,701 cu. yds. of earth, at a cost of $4,133,761.96. This work was distributed as follows: In Arkansas—On Arkansas River, 3.28 miles, at a cost of $28,329.16; on Mississippi River, 22.60 miles, at a cost of $351,508.97. In Louisiana—On Mississippi, 133.74 miles, at a cost of $2,946,059.53; on Red River, 51.16 miles, at a cost of $455,498.78; on Atchafalaya River, 18.22 miles, at a cost of $258,792.86; on Ouchita River, .06 miles, at a cost of $824; on Boeuf River, .04 miles, at a cost of $1,276; on the gulf coast, 7.27 miles, at a cost of $37,361.80; interior streams, 2.75 miles, at a cost of $54,110.86. The amounts given in the foregoing figures do not include those involved in the drainage work executed by the Red River, Atchafalaya and Bayou Boeuf Levee District during the past two years, costing $85,822.16, on which class of work some $5,643 worth still remains to be done under existing contracts. Nor do they include the work for the improvement of Bayou Lafourche, for navigation and the supply of fresh water, undertaken by the joint organization of the Atchafalaya Basin and Lafourche Levee Districts, on which some $417,548.48 has been expended from inception to date. In addition to the above, there still remains to be done under contracts of the state and the several levee districts, in force at this time, an amount of levee work estimated to aggregate not less than 2,250,985 cu. yds., and to cost (in addition to percentages retained until completion) not less than $565,497.78. Again, a considerable amount of work has, as usual, also been done in, and expenditures incurred by the several levee districts of the state and by the United States for weed-cutting, minor repairs, wooden revetments and for auxiliary works of various descriptions. Information upon which to base exact statements in regard to all these particulars is not at hand, but the sum involved is considerable. The aggregate length of levee lines is 1,263.5 miles. In addition to these, there are a number of lengths of levee line in comparatively isolated localities, and on interior streams, some parts of which are not located in any regular levee district, amounting to about 340.4 miles, making a total length of levee lines more or less protecting Louisiana, at this time, of 1,603.9 miles; that is, 155.7 miles in the state of Arkansas and 1,448.2 miles in Louisiana.

A Record for Rock Tunnel Driving.

Something of a record for tunnel driving in rock was made during the month of May in the Laramie-Poudre tunnel in Colorado. According to press dispatches the tunnel was driven from two headings a total distance of 845 ft. during the month. The heading from the west end was driven 332 ft., while the heading from the east end was advanced 513 ft. The rock is stated to be a very firm hard granite, requiring the drilling of 27 holes in the face for explosives. The tunnel as driven is 7 ft. 6 in. high and 9 ft. 6 in. wide and is nearly oval in shape. The tunnel is being driven on a grade of 1.7 per cent, sloping from the west toward the east and consequently the material removed from the west end had to be hauled up grade, whereas in the east end the loaded cars run down grade and only the empties have to be hauled up. The west end workings do not run directly out into the open air on grade but are connected with the surface by a 200 ft. incline. This was done to avoid about 1,400 ft. of waterbearing rock and wash which had it been opened up would have drained directly down the tunnel into the headway. As it is a considerable amount of water seeps in and has to be pumped out. The tunnel is being driven in connection with a hydro-electric development. The work is being done by contract, and the men are working on the bonus system, receiving an extra amount of pay for each foot driven over 250 ft. in each calendar month.

Wages and Efficiency of Labor.

Are contractors paying men a third more wages and getting a third less work from them now than five years ago? Such is the fact claimed to be responsible for the great sums by which the actual cost of the Government irrigation work has exceeded the original estimated cost. It is one of the reasons given for the latest enormous increase in the estimated cost of the Panama Canal. It is common knowledge that both prices and wages have increased in the last five years. Have wages on construction work increased 33⅓ per cent? Is it possible now to get only two-thirds the work out of men engaged in such work that we got in 1905? Certainly such facts, if they are really facts, merit investigation into causes and reasons. Are they facts? The editors would like to have from contractors figures based on their experience.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

CALIFORNIA.

The Butte & Plumas Ry. Co. has completed surveys and has secured the capital for the construction of a 30-mile railroad from Oroville to Stanwood in Butte county. The company is constructing the road with its own forces. The line is to be primarily constructed for the Truckee Lumber Co. E. S. Dunbar, Oroville, Cal., is chief engineer. O. C. Haslett, San Francisco, is president.

OHIO

G. F. Bristol, Grand Rapids, Mich., has taken a sub-contract from J. C. Carland & Co., Toledo, O., for about 5,000 cu. yds. of concrete bridge work on the Ohio Electric Ry. near Middletown, O. Work will be started at once with two outfits. Mr. Bristol's office on the work is at Middletown, O.

OREGON.

The Carlton & Coast R. R., which projects a 14-mile line from Carlton, Ore., to Fairdale, has completed surveys and has secured the capital for construction. Construction contracts will be let about July 1. Chas. E. Ladd, Carlton, Ore., is president and M. L. Johnson, Carlton, Ore., is chief engineer.

PENNSYLVANIA.

The Tower City, River City and Johnstown Street Ry. Co. has completed surveys and has secured the capital for the construction of its projected 3-mile line from Tower City via River City to Johnstown. Construction contracts are to be let in July or August. The road is to be operated by gasoline motor cars. Walter E. Harrington, The St. James, Philadelphia, Pa., is chief engineer. J. W. Moyer, Pottsville, Pa., is president.

TEXAS.

The Morey-Fauhlaber Construction Co., 1212 Chemical Bldg., St. Louis, Mo., and Lometa, Tex., have several miles of grading to sub-let on the Lometa West extension of the Santa Fe in Lampasas County, Texas.

The survey of the projected Houston, Somerville & Western Ry. is now complete between the towns of Somerville and Taylor, Tex., a distance of 60 miles. Correspondence and bids are asked from contractors for grading the same. The line contemplated will be 125 miles in length and will run through a timbered country and traverse for the entire length a rich farming country, a part of which is at the present time overgrown with valuable oak timber. H. H. Fielder, 427 Boulevard, Houston, Tex., is President.

WASHINGTON.

We are advised that the work of constructing the Point Defiance Line of the Northern Pacific Ry. has not been readvertised. The first set of bids were considered too high and were rejected. The line is to be 42 miles long and will extend from Tacoma to Tenino.

CANADA

The O'Boyle Construction Co., Ltd., Sault Ste. Marie, Ont., has been awarded the contract for completing the roadbed and track laying on the Algoma Central from the present end of steel at Mile 69, North of the Soo through to a connection with the line extending from Michipicoten Harbor back to the Mines of the company at Mile 170.

Regarding a proposed branch line of the Grand Trunk Pacific Ry. passing through Weyburn, Sask., we are advised that at the present time the company is constructing a branch line in a southeasterly direction from Regina, towards the international boundary, for a distance of approximately 90 miles. The route being followed is about 18 miles east of Weyburn, and the citizens in the vicinity have requested the management to divert the line or accommodate them with a spur line, and they have been promised that the company would have an investigation made of the country and if it was found feasible to build the spur they request, and the amount of business from that territory would justify the expenditure, the Grand Trunk Pacific would make application for a charter.

Power Developments, Levees, Drainage and Irrigation Works.

CALIFORNIA.

The Sacramento Valley Irrigation Co., Willows, Cal., will in August ask for bids for the construction of laterals and drains in its Delevan Unit, involving 1,200,000 cu. yds. of excavation. This will be the third lot of work; the first was for 1,700,000 cu. yds. and the second 800,000. Some time this fall the company will be prepared to let a contract for 300,000 cu. yds of re-construction work on the upper end of the Central Canal, and in the early part of 1911 it will let contracts for the lateral and drainage system of the "Maxwell" and "Southern" Units, which will involve approximately 2,500,000 cu. yds. John P. Ryan, Willows, Cal., is assistant engineer.

COLORADO.

Bids are asked by the city of Boulder, Colo., until 7 p. m., July 18, for the construction of a rubble concrete masonry dam at Albion Lake Reservoir. The dam is to be 60 ft. high and the work includes about 13,000 cu. yds. rubble concrete, together with necessary excavations, gate houses, valves, etc. Fred R. Duncan is City Engineer, and M. S. Ketchum, 438 Century Bldg., Denver, Colo., is Consulting Engineer. The official advertisement will be found elsewhere in this issue.

CONNECTICUT.

The Ryan-Unmach Co., New Haven, Conn., was awarded the contract on June 14, by the city of Waterbury, Conn., for constructing a storage reservoir dam. The work includes approximately: Concrete masonry, 1:3:6, 25,600 cu. yds.; concrete masonry, 1:3:5, 5,000 cu. yds.; concrete blocks, 2,960 cu. yds.; rolled embankment, 525,000 cu. yds.; crushed stone, 5,900 cu. yds.; paving, 8,900 cu. yds.; loaming on dam, 6,300 cu. yds.; loaming adjacent areas, 5,000 cu. yds. sodding, 18,840 cu. yds.; drain gate house complete, exclusive of foundation; service gate house complete.

FLORIDA.

The State Board of Drainage Commissioners has awarded a contract to the Furst-Clark Construction Co., Baltimore, Md., for the construction of 184 miles of drainage canals in the Everglades requiring 19,013,495 cu. yds. of excavation. Bids for this work were opened June 15 at Tallahassee, Fla. Further details as to the work were given in our issue of May 18.

ILLINOIS.

The Traer Coal Co., Danville, Ill., have 40 acres of coal near Danville to be stripped of earth, gravel and shale, and would like to get figures on the work.

LOUISIANA

The Jahncke Navigation Co. of New Orleans, La., has been awarded the contract for dredging at Chefuncte and Bogue Falia rivers, La., for the U. S. Government. The price is 19½ cts. per cu. yd. and the approximate amount of dredging to be done is 30,000 cu. yds.

Following bids were received June 13, at the office of Col. Lansing H. Beach, U. S. Engineer, New Orleans, for furnishing about 10,000 cu. yds. of stone for use in connection with the maintenance of jetties and auxiliary works at South Pass or Southwest Pass, Mississippi River: Richard M. Murphy, New Orleans, La., $3.90 per cu. yd.; John Riess, New Orleans, La., $3.95; Oscar F. Barrett, Cincinnati, O., $3.95; C. C. Huthmacher, Grand Tower, Ill, $3.95; Zeb Ward, Little Rock, Ark., $3.95.

The Lake Arthur Irrigation Co. of Lake Arthur, La., recently incorporated, has holdings of about 4,000 acres of wet prairie lands, and is now investigating another tract of 8,000 acres. The company does not expect to do any development work this year.

MICHIGAN.

Bids are asked by the Board of Public Works of Sturgis, Mich., until 7 p. m., July 6, for the construction of a brick and concrete water power station and excavating for a tailrace; and also for a concrete multiple arch spillway and an earth embankment. The official advertisement will be found elsewhere in this issue.

NEW YORK.

George B. Spearin, 90 West St., New York City, has been awarded the contract at $27,579 for building a pier and bulkhead platform at the foot of Oliver St., on the East River, New York City, for the Department of Docks and Ferries. Bids were opened June 6.

NORTH CAROLINA.

Following bids were received June 14 by Capt. Earl I. Brown, U. S. Engineer, Wilmington, N. C., for 12,000 tons of stone: Balfour Pink Granite Co., Salisbury, N. C., large stone, 2,000 tons, at $1.40; small stone, 10,000 tons, at $1.40. North Carolina Granite Corporation, Mt. Airy, N. C., recommended for award, small stone, $1.35 per ton, large $1.40; Columbia Granite & Dredging Co., Washington, D. C., small $2.24, large $2.24; The Breakwater Co., Philadelphia, Pa., small $1.97, large $1.97; John Monk & S. E. Morris, Norfolk, Va., large $2.77½.

PENNSYLVANIA.

The Vipond Construction Co., Altoona, Pa., has been awarded the contract at $55,000 for constructing a storage reservoir and enlarging present dam of the Tyrone Gas & Water Co., at Tyrone, Pa. The work includes clearing 17 acres of land, about 100,000 cu. yds. of earth work, about 2,000 cu. yds. paving, masonry, etc., and about 7,000 cu. yds. of puddle work.

WEST VIRGINIA.

The following bids were received June 15 at Wheeling, W. Va., by Capt. F. W. Alstaetter, U. S. Engineer, for constructing Peircedam foundations and extension of piers for Dam No. 13, Ohio River:

	The Ohio River Contract Co., Evansville, Ind.	Curtis, Shumway & Deane, Portsmouth, O.
Cofferdam	$10,000.00	$27,345.00
Common excavation	0.60	1.75
Coal excavation	2.50	1.75
Rock excavation	3.00	3.00
White-oak timber, M	100.00	90.00
Concrete	8.00	8.00
Structural steel	.07	.05
Bolts, etc.	.07	.05
Iron castings	.07	.05
Forgings	.07	.10
Pumping and maintaining cofferdam	40.00	30.00

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

(Confirmed Reports Continued.)

CANADA

M. J. Hogan, Port Colborne, Ont., has been awarded the contract for the improvement to the Port Colborne entrance of the Welland Canal for the Department of Railways and Canals of Canada.

The following are the dredging contracts in the Province of Ontario which have been let by the Canadian Department of Public Works:

Places.	Contractors.	Address.
Kincardine, Lion's Head&Pt.Elgin	The Dredging & Drainage Co. of Ont., Ltd.	Toronto, Ont.
Port Burwell	The General Cons. & Dredging Co., Ltd.	Toronto, Ont.
Byng Inlet	Manley & Co.	Toronto, Ont.
Goderich	Wm. L. Horton	Goderich, Ont.
Cobourg	The Randolph Macdonald Co., Ltd.	Toronto, Ont.
Port Hope and Whitby	W. E. Phin	Welland, Ont.
Picnic Islands	C. S. Boone Cons. & Dredging Co., Ltd.	Toronto, Ont.
Rainy River	A. F. Bowman	Southampton, Ont.
Owen Sound	R. Weddell & Co.	Trenton, Ont
Rondeau	The Windsor Dredging Co., Ltd.	Windsor, Ont.
River Thames	W. E. Phin	Welland, Ont.

Alabama Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The promoters of the long talked of Coast electric line from Scranton, Miss., to Mobile, Ala., where a connection will be made with the Mississippi Coast electric road, are now seeking a right-of-way through Mobile County, Ala. As noted under Mississippi notes in our last issue the supervisors at Scranton have granted a franchise for the line to the Alabama state line to W. D. Bullard, of Scranton, Miss. Mr. Bullard is the attorney representing the capitalists who are building the line.

The city council of Gadsden, has extended the franchise of the Noccalula Railway Light & Power Co., until July 6. The company proposes to build a line of electric railroad from Noccalula Falls to Gadsden, Alabama City and Attalla, a distance of about five miles.

The Seaboard Air Line Ry., W. L. Seddon, chief engineer, Portsmouth, Va., according to reports, will shortly commence work on the construction of its long contemplated line into Anniston. It is stated that the work will be started at a point near Tredigar or Jacksonville and the line be completed into Anniston by the first of next year. The work will mean the construction of 17 miles of new line. It is said over $85,000 has been expended in securing cross-country rights-of-way.

Preliminary steps have been taken at Selma for the formation of a company with a capital stock of $200,000 to build the proposed railroad from Selma up the Canaba valley to the Birmingham district. About $75,000 of stock subscriptions have already been promised. It is expected that between $15,000 and $20,000 will purchase rights-of-way and cover the cost of a survey and that for $75,000 tracks could be laid for half the distance when it could be bonded for the remainder. J. C. Suttles, Brent, Perry County, is interested.

The construction of a railroad from Pensacola, Fla., to Andalusia, Ala., is proposed and a representative of New York parties has made a proposition to Pensacola capitalists that if they will raise $250,000 and secure a franchise from the secretary, which will include water front rights, the New Yorkers will build the road. There has been $200,000 raised already.

The Alabama Power & Development Co., Talladega, is to make surveys for a proposed electric trolley line from Talladega to Gadsden via Anniston.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The San Francisco & Transbay R. R. Co. has been incorporated with a capital stock of $1,500,000, of which $69,600 has been subscribed by Attorney H. H. McCloskey, San Francisco, or the interests he represents. The other incorporators, nominally, are E. Schnulenhaus, J. Comerford, A. Mulverhill and L. Block. The company purposes to build a suburban railroad 70 miles in length from Niles to connect with Redwood City across the bay, taking in Dumbarton point on the way. Besides the main line from Niles to Dumbarton point and crossing the bay with connections to Redwood and Woodside through San Francisco, a branch is to run from Redwood to Woodside, and from Dumbarton to Warm Springs.

The Truckee Lumber Co., Flood Bldg., San Francisco, has started getting out the ties and timber for its projected 30-mile railroad from Oroville to Stanwood. Stoneman Dowe, purchasing agent of the company, has established a grading camp at Oroville. The road will be known as the Butte & Plumas R. R.

Mayor M. R. Beard of Sacramento, favors making provision in the next tax levy for the extension of the city wharf. The wharf now extends from M to the south line of N St., a distance of 400 ft., and is not adequate to accommodate all the business.

The Ocean Park Amusement Co., A. R. Fraser, president, Ocean Park, has had work started on a large pleasure pier at Ocean Park, which will cost $220,000. It will be a combination of the present Pier Ave. and Marine Ave. piers, with a large extension, and will be in the shape of a horseshoe, occupying 28,000 sq. ft, of floor space.

The Oakland Traction Co., Oakland, has completed profiles for its proposed Euclid Avenue car line extension at Berkeley from University and Shattuck Ave. to the end of Euclid Ave. in the Wheeler tract. The franchise was granted on June 19, and the work of construction will commence immediately. Owing to the heavy grades met with from Hilgard St. north, low-geared cars with high-powered motors will be necessary. The company has begun gathering data for the installation of new machinery.

Announcement has been made by John D. Spreckles, President of the San Diego & Arizona R. R., San Francisco, Cal., that contract has been awarded Robert Sherer & Sons, Los Angeles, Cal., for the construction of the third section of the line in Mexican Territory. The contract covers about ten kilometers in length and includes all fills and cuts for that distance. When this work is completed the roadbed of the San Diego & Arizona line will have been finished as far as Rock Springs and the San Jacinto ranch. No engineering problems are to be met in the district. The road is to follow the San Jacinto river most of the way, being through a fairly level country. On the next section, however, the road begins to enter the mountainous district of Lower California, where the engineering work will become more difficult. Construction of the roadbed on the second section in Mexican territory is progressing rapidly and it is believed will be finished soon. The work of boring the tunnels is nearly completed.

William Hood, San Francisco, Cal., Chief Engineer of the Southern Pacific Ry., is stated to have announced that another contract would be let for the construction of the Natron extension at the Klamath Falls, Ore., end of the line. The Utah Construction Co., Ogden, as noted in Engineering-Contracting some time ago, is working on the Natron end of the extension and it is fully expected that trains will be operating as far as Hazel Dell, 40 miles from Eugene, Ore.

Preliminary steps have been taken at San Bernardino by business men for the construction of a trolley line between that city and Rialto.

W. C. Elsemore, C. E., Eureka, has made surveys at the Minor quarry near Warren Creek, Blue Lake, for a short piece of railroad in order to haul the rock to the main railroad line.

According to reports circulating in Alturas, Cal., the Nevada, California & Oregon R. R. Co., on account of some complications in securing necessary right of way for the proposed Lakeview extension, have decided to change the route.

Committee of Fourteen of Eureka, Cal., who are promoting the construction of the Humboldt & Eastern R. R., are awaiting the action of United States Government on the request of the promoters to buy 2,000,000 ft. of lumber in the National Forest, necessary for the construction of the proposed line. W. S. Clark, Eureka, Cal., is Chairman of the committee.

The construction of an electric railway from Fresno to Monterey by way of Coalinga is proposed. It is estimated that the road could be built for about $4,000,000. Among those interested are A. G. Metz and H. M. Bergine, of Monterey.

The City Engineer of Oakland has submitted to the Board of Public Works plans and specifications for a wharf at Livingston St., East Oakland, to cost $175,000.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Federal Light & Traction Co., New York, organized recently with a capital stock of $11,000,000, will take over all the holdings of the United States Light & Traction Co., which has its headquarters in Denver. The last named corporation has been the holding company for eleven subsidiary companies in Colorado, Wyoming, New Mexico and other Western states. W. L. Iliff of Denver has been president. The other officers are C. K. Durbin, vice president, and O. L. Moore, treasurer. The properties taken over by the Federal Light & Traction Co. are as follows: The Albuquerque, N. M., Gas, Electric Light & Power Co., Albuquerque, N. M., Electric Power Co.; Tucson, Ariz., Gas, Electric Light & Power Co.; Tucson, Ariz., Rapid Transit Co.; Las Vegas, N. M., Light & Power Co.; Las Vegas, N. M., Transit Co.; Sheridan, Wyo., Electric Light & Power Co.; Rawlins, Wyo., Electric Light & Fuel Co.; Montrose, Colo., Light & Power Co.; Hobart, Okla., Gray's Harbor Railway & Light Co. Mr. C. K. Durbin, Denver, will be manager of the properties.

The Havermeyer Land Co., Grand Valley, has had engineering work under way for a canal 20 miles long to carry 300 cu. ft. of water per second for irrigation purposes.

W. A. Colt is making good progress with his contract for constructing a 35 mile canal for the Desert Land, Reservoir & Canal Co. The work is located about 45 miles northwest of Los Animas.

J. L. Frankeberger, Boulder, has been making some surveys near Barr for a proposed irrigation reservoir.

The Montezuma & Western R. R. Co., incorporated a short time ago with a capital stock of $500,000, has announced at Denver that construction of its proposed line from Denver to Leadville would begin within 30 days. The company is allied with the Argentine Central Ry. of which E. J. Tuttle, Denver, Colo., is General Manager, and will

use the Argentine tunnel to get through the Continental Divide.

The Williams River Highland Co., represented by Dr. D. G. Leach, has submitted to the State Land Board at Denver a proposition for buying and irrigating every alternate section of land in Routt County, south of the Bear River, and aggregating 34,000 acres.

The litigation between the Colorado & Eastern R. R. and the Chicago, Burlington & Quincy R. R., over right of way at Denver has been settled, and now that the case has been finally disposed of it is believed that in a few weeks some announcement will be made as to the future of the little road, said to be owned by the Havemeyers and badly wanted by different roads for its valuable rights in the city. The Colorado & Eastern won the case and holds its right of way for a distance of about 700 ft. near the stock yards at Denver, over which the Burlington refused to allow it to build, as its tracks crossed at the same place. The first suit was started six years ago.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Hickson Lumber Co., of Cheraw, S. C., which recently purchased large bodies of timber in Emanuel County, proposes to construct a railroad line to cross the Georgia & Florida at Summit, and intersecting the Central of Georgia at Midville and the Savannah, Statesboro & Northern seven or eight miles above Summit. This line will run through the timber above Summit and below Summit will cross the Bruton and Pinora branch of the Central near Metter and run to the coast at Darien or Brunswick.

The Atlanta Hydro-Electric Power Co., of Atlanta, is making plans for the further financing of the company. The company will build a dam 700 ft. in length across the Tugaloo River and will develop 25,000-hp., which will be brought to Atlanta and other places between there and the source of development.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Representatives of A. Welch, Portland, Ore., have been negotiating for the purchase of the Lewiston Terminal Co.'s holdings at Lewiston, Idaho, and this move has given rise to the report that Lewiston might be the eastern terminal of an electric railway extending through Walla Walla, and to Pendleton, Ore. A. Welch built the Walla Valley R. R. from Walla Walla to Milton. With his associates he now controls and operates street railway lines in Salem, Albany, Eugene and Springfield, Ore. Lines are also projected from Eugene to Springfield and from Salem, through Albany, to Eugene.

The Gilmore & Pittsburg R. R., the first section of which is now nearing completion, according to announcement from Lewiston, Idaho, is to consist of feeder lines of which 453 miles will be constructed from Salmon City, Idaho, through Lewiston to Pasco, Wash., with a line also from the Salmon River to Grangeville. The company has planned lines to Boise, Idaho, and to Walla Walla, Wash., the length of the former being figured at 250 miles. W. A. McCutcheon, Machesney Bldg., Pittsburg, Pa., is President.

The Pacific & Idaho Northern Ry., E. M. Heigho, President, Weiser, Idaho, has placed engineers in the field to locate and cross-section the route for the proposed extension north from Evergreen, the present terminus to Meadows, 16 miles distant. It is intended to have trains running into meadows by November 1.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city council of Moline has extended the franchises of the Tri-City Ry. Co. and the East Moline interurban line for 20 years. The ordinances provide for a number of extensions.

There is some talk here in Joliet of constructing a loop to connect the Chicago & Joliet line at Ingalls Park with the Joliet & Southern line at Red Mill bridge. Neither of the two roads seems to be exactly in favor of the loop, and it is reported that Col. L. E. Ingalls, Joliet, owner of the park, may build the line himself.

Good progress is being made with the construction of the interurban line of the Springfield & Jacksonville Electric Ry. Co. between Springfield and Jacksonville. Grading work has progressed so far that G. Gridley, Springfield, who has the contract for track laying, will shortly commence placing the steel from the Springfield end of the line. In the meantime E. E. Hedley, Charles Van Warmer and Oscar Bonner, sub contractors on the grading work, are making the dirt fly. The latter started work on June 7 at Riddl Hill with 70 teams. Elmer Hayden has the contract for the fencing and Al Renecker, Jacksonville, has the contract for pulling the brush along the right of way. Both of these are making good progress. Blain & Brown, who took the concrete work, have already completed three of the bridges. The officers of the company are as follows: O. J. Lucas of Latham, president; D. T. Torrence, Decatur, vice president; J. H. McFarland, Jacksonville, general manager; D. S. Benjamin, Springfield, manager of the bond department; D. B. Sims, Latham, secretary.

The city council of St. Charles is considering applications of two electric cross state railways for franchises through St. Charles and still another company is circulating a petition preparatory to applying for a franchise. The two railways applying for a franchise are the Kansas City & St. Louis Electric Railway Co and the St. Louis, St. Charles & Northern Traction Co. Both wish to run their lines down Adams St., St. Charles, to the present highway bridge over the Missouri River. The former road is headed by Judge D. C. Nevins, president, W. J. Allen, vice president, and Judge William R. Loomis, secretary, all of Kansas City. It proposes to have tracks from St. Louis to Kansas City. The proposed line is 25 miles shorter than that of the Wabash R. R., extending a total of 225 miles. The St. Louis, St. Charles & Northern Traction Co. proposes a line from St. Louis through St. Charles, Warrenton, Bowling Green to Hannibal and connecting at Hannibal with branch lines through northern Missouri counties. This company is promoted by R. E. Race of Mexico, Mo. It wishes a franchise down Adams St. in St. Charles and proposes to use the highway bridge. The third company which is now circulating a petition would pass through St. Charles after crossing the Mississippi River at Alton.

Surveys have been started by the Milwaukee Construction Co. of Milwaukee, Wis., for the proposed interurban line of the Rock River Traction Co. between Sterling and Moline. The plan is to run the interurban parallel with the bluff road from Sterling through Erie, Hillsdale and Watertown, with spurs to Morrison and Prophetstown. It is stated that the Milwaukee Construction Co. will build the road and turn it over to the stockholders. The Milwaukee Construction Co. is building the road promoted by Joseph Wright, Rock Falls, Ill., between Geneseo and Sterling. Mr. Wright is also promoter of the new line.

The Chicago & Joliet Ry., Joliet, has made surveys for a line from Collins on Meeker to the west end of the proposed E. J. & E. steel car repair shop, and on to the northeast part of the city of Joliet.

An active canvass is to be made shortly to secure local support for a proposed interurban railway between Centralia and Springfield, passing through Pawnee, Morrisonville, Hillsboro, Coffeen, Greenville, Carlyle and Hoffman, with a connecting line from Coffeen through Vandalia, Kinmundy and Flora to Mt. Carmel, and one from Greenville through Alhambra and Edwardsville to East St. Louis. Isaac A. Smith, Bank of Commerce Bldg., St. Louis, Mo., is interested.

R. E. Race, Mexico, Mo., promoter of the St. Louis, St. Charles & Northern Traction Co., mentioned elsewhere in this column, accompanied by Messrs. Berwick and Koch, consulting engineers, has made a trip extending over many miles of territory between St. Charles and Troy. It is now thought that the route of the line may be changed after running from Laddonia in a southeasterly direction, so as to shorten the distance, in which case the line will run from a point north of Moscow Mills about one mile, thence to Chain of Rocks, St. Paul, St. Peters and thence into St. Charles.

The St. Louis, Terre Haute & Quincy Traction Co., which projects a line between the places named, has elected the following officers: William Fick, of Quincy, President; Peter Simonds, of Jacksonville, Vice President· F. W. Hollenberg and S. P. Landcraft, of Quincy, respectively, secretary and treasurer.

The Cleveland, Cincinnati, Chicago & St. Louis R. R. has completed nearly all double track work between Chrisman and Danville, Ill., and is planning to extend it to Paris and eventually to Cario, Ill.

The Commissioners of the Illinois & Michigan Canal have under consideration the matter of rebuilding the dam at Dayton and the reopening of the feeder between that point and the city of Ottawa. W. L. Sackett, Morris, Ill., is a member of the Commission.

The Meyer & Thomas Construction Co., of Chicago, has been incorporated with a capital stock of $25,000 and will engage in a general contracting and construction business. The incorporators are J. A. Meyer, E. A. Thomas and H. T. Ellis.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Construction work has been started at both the Rockport and Grandview ends of the traction line between those places. The line will be six miles long and W. H. Cost, Rockport, Ind., is in charge of the construction.

The Louisville & Southern Indiana Traction Co. of New Albany has under consideration the building of an extension to Walnut Ridge cemetery, a mile north of Jeffersonville, Ind.

M. M. Defrees & Son, Indianapolis, have been awarded a contract for the tunnel to connect the different tracks and portions of the grounds at Beech Grove, Ind. This tunnel is to cost $25,000 and will be completed this season.

Preliminary surveys have been made for an electric railway from Nashville to a connection with the Indianapolis & Southern R. R. The line would be seven or eight miles long and would cost about $80,000. The construction of several trestles would be required. It is proposed to use gasoline motor cars. J. A. Johnson, Indianapolis, is interested.

Herman Tapp, who has the contract for track elevation work at Fort Wayne, has begun construction. Recently Mr. Tapp advertised for 150 men by means of placards on telegraph poles, and in this way secured a man, which shows that it pays to advertise.

The Fort Wayne & Winona Traction Co., of Fort Wayne, has been incorporated with a capital stock of $100,000. J. A. Barry, Ed. G. Hoffman, E. W. Cook are the incorporators.

The Evansville & Terre Haute R. R. will commence work about July 1, laying a considerable amount of new rails between Terre Haute and Evansville. The company also has under consideration the reconstruction of several bridges and trestles along the line in addition to the track work.

A small force of men has been placed at work on the grade for the proposed traction line from Madison to Scottsburg. This road will connect with the Indianapolis & Louisville Traction Co., the last named company connecting with the Indianapolis, Columbus & Southern Traction Co. at Seymour. The work on the Madison-Scottsburg line was begun a few days ago to save a franchise, but it is said that the work will be continued and that a larger force of men will be put to work.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Iowa City Electric Ry. Co., mentioned a short time ago in these columns, has elected the following officers: J. O. Schulz, presi-

dent, Commercial Club room, Iowa City; J. H. Rohret, vice president, and D. A. Reese, secretary and treasurer. The company is an Iowa City corporation and has a capital stock of $100,000. It will this year build a line between Wright St. and several points in Iowa City.

The Chicago, Rock Island & Pacific R. R. has had engineers in the field running a line between Rockford and Forest City, a distance of 35 miles, which will connect two divisions of the road. The survey runs three miles north of Mason City, where it strikes the Iowa Central, over which the Rock Island plans to enter the city.

Steps are being taken to ascertain the feasibility of building a railroad from Waterloo south through Benton and Iowa Counties to the coal fields of Keokuk County. The route as now proposed runs from Waterloo to Garrison and thence to Van Horn in Benton County. From the latter place it extends to either Belle Plaine or Blairstown, and thence to Marengo in Iowa County. From Marengo it is proposed to build a line in a southwesterly direction to What Cheer and other points in the coal fields of Keokuk and Mahaska Counties. S. B. Howard, New York City, is now in the field.

It is reported that Rock Island surveyors are running lines preliminary to the construction of the proposed line from Rockford to Forest City, Ia., by way of Mason City.

Work has been started on the double tracking of the Great Western R. R. through Waterloo, Ia.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Kansas City, Kaw Valley & Western Ry. Co. has been organized and will take over the property of the Kansas City & Bonner Springs Ry. Co., operating about five miles of track east from Bonner Springs, and will connect with the Kansas City Western electric line, coming in over its tracks from Bethel to Kansas City, Kan. About $150,000 has already been expended in the construction of the road and it is estimated that an additional $225,000 will be necessary to complete the line. The Freeborn Engineering & Construction Co. of Kansas City Mo., has taken up the matter and guarantees to complete and operate the road, providing the citizens of Bonner Springs and Kansas City, Kan., subscribe $100,000 worth of 6 per cent first mortgage bonds.

The Interurban Construction Co., of which O. A. Boyle, Wichita, is president, has completed four miles of track on its projected interurban line between Valley Center and Wichita. J. G. Jennings is doing the grading work and is now working on the stretch of track between Sedgwick and Valley Center.

Straight Creek, in Jackson County, so called because it is so crooked, is to be straightened under the state drainage law by the farmers living along its course.

Capitalists of Hutchinson are considering forming a company to build a line of track from the city to Burrton to a connection with the Frisco. It is estimated that the line would cost about $80,000, and should it be built it would be offered to the Frisco to operate. Emerson Carey, Hutchinson, is interested.

Bennette & Co., who have been engaged on the construction of the Kiowa, Hardtner & Pacific R. R. for the past half year, have moved their grading outfit to Turon, where they have begun to throw dirt on the new line from Turon to Kinsley.

A proposition has been presented to the business men of Salina for the construction of a new north and south railroad from Beatrice to Wichita, then on to the Gulf. According to the plan the starting point of the road will be Beatrice. It will run thence to Washington, Kan., through Clay Center, Salina, McPherson, Wichita and on to the Gulf. The proposition made to the meeting was that each county through which the line will pass furnish $100 for a preliminary location of the proposed line. B. Imes, Clay Center, and Francis B. Morgan, of the Morgan Construction Co., McPherson, are interested.

Kentucky Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Commercial Club of Murray, Ky., has appointed committees to arrange for the construction of an electric railroad from that place to the Tennessee River.

The Owensboro City Railway Co. property of Owensboro has been mortgaged to the American Trust & Savings Company of Evansville, Ind., for $200,000. Bonds will be sold and the money used in the extension of the lines in Owensboro and the building of interurbans. The property was recently taken over by an Evansville syndicate.

The General Traction Development Co., of Cleveland, O., represented by C. B. Porter, has submitted to the directors of the Henderson Commercial Club and other business men of Henderson a tentative proposition for the developing, financing and construction of a system of interurban traction lines radiating from Henderson.

Louisiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Ouachita Development Co. of New York, of which Captain Nichols, Monroe, La., is local representative, is stated to be planning to have construction work started on its line between Monroe and Farmerville and beyond to points in Arkansas as soon as all bonuses are voted. A tax has already been voted in West Monroe and Farmerville. A complete survey of the road has already been made and the line definitely located to Farmerville. The line will require two long steel bridges. The one across the Ouachita River will cost approximately $200,000, while the one over Bayou Darbonne, near Farmerville, will be an expensive proposition. J. A. Taylor is the New York representative.

A plan is under consideration to connect Crowley with the proposed canal running from Abbeville through the Vermilion River to Lafayette. It is proposed to build a canal from Lafayette to Crowley at a cost of about $100,000. To construct the canal, irrigation ditch and roadbed from Lafayette to connect with Bayou Plaquemine Brulee, near Crowley, it is proposed to organize a drainage district consisting of the parishes of Lafayette and Acadia.

A mass meeting at Alexandria, La., passed resolutions that legislative action be taken at the current session of the state legislature for levee work as recommended by the board of state engineers. This work is the construction of a line of levee along the west bank of the Red River from Boyce to Alexandria. The approximate number of cubic yards of earth contained is 950,000 and approximate cost $166,500. It also includes the improvement of drainage in Bayou Robert and Bayou Boeuf from Bayou Rapides to the mouth of Bayou Cocodrie, the cost being $350.000. The total cost is $516,500.

Engineers of the St. Louis, Iron Mountain & Southern Ry. have completed plans for the reconstruction of the line to Greenwood and the extension of the same from that city to Gurdon, Ark. With the completion of this branch, Fort Smith will have a direct connection with New Orleans, La., and many other important southern points. E. J. Correll, Little Rock, Ark., is Engineer Maintenance of Way.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Detroit & Mackinac Ry., H. S. Waterman, chief engineer, East Tawas, Mich., has been making a survey for a branch from its main line to Rogers City. That place has offered to give right of way and land for terminals and it is said that construction work will be started so as to have the branch in operation by November.

Construction work is reported to have been started this week on a new third-rail electric railway from Lansing to Grand Ledge. J. S. Mudge and J. W. Ewing, Grand Ledge, are the promoters.

The Grosse Ile Ry. Co. has about completed preliminary plans for its loop line on Grosse Ile, a suburb of Detroit.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Twin City Rapid Transit Co. will soon petition the St. Paul city council to relieve it from the requirement to construct a car line from Como boulevard to Rice street, as contained in the Gerber ordinance passed last January. The company claims that there is nothing to warrant such a line.

Contracts are about to be let, it is said, for the proposed interurban line between Virginia and Eveleth and Gilbert. According to a statement of E. M. Prindle, Duluth, promoter of the line, the road will start from the Duluth, Missabe & Northern tracks, in Virginia, extend west on Mesaba Ave. to the road to Gilbert, and continue to that village, about 3½ miles. Another line will extend down Larch St., in Virginia, to the Eveleth road, continuing on that road to the More hospital, just outside the city limits.

E. W. Dotten, Cromwell, has been awarded the contract at Aitkin for constructing County Ditch No. 11. The contract price is $7,934. The work calls for moving 76,103 cu. yds. of material.

C. S. Erickson, Mankato, has been awarded the contract for extending the dike at North Mankato, the work amounting to about $1,500.

The Chicago, Milwaukee & St. Paul R. R., according to a reported announcement from St. Paul, in order to handle its Puget Sound extension business, will double track its entire Hastings and Dakota division from Minneapolis across Minnesota to the South Dakota line. At Granite Falls, Minn., an eight mile cut-off will be built soon, and at Montevideo, Minn., a ten mile cut-off, and this will be the beginning of work which within the next few years will mean a double track throughout. At Granite Falls and at Montevideo heavy grades in the Minnesota River and Chippewa River valleys will be eliminated for east bound trains pulling heavy loads.

The Duluth, Missabe & Northern R. R., which has considerable construction work under way, is now laying steel on the new line between Chisholm and Wilton, Minn., and it is expected by the officials to begin train service July 20.

Mississippi Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Alabama & Vicksburg Ry. (a Queen & Crescent line) has filed an amendment to its charter increasing its capital stock from $1,050,000 to $2,100,000. Inasmuch as it is denied that branch lines are to be constructed, it is believed that a general improvement in the line and equipment of the company is contemplated.

The property of the Meridian Light & Railway Co., of Meridian, was formally transferred on June 15 to the Doherty Operating Co., of New York. The sale was made some time ago, and the New York company took charge, but the formal change and the election of officers took place June 15, the following being elected: President, Henry L. Doherty; First Vice President, Russell Palmer; Second Vice President and General Manager, A. B. Paterson; Secretary and Treasurer, Paul R. Jones; Assistant Secretary and Treasurer, Carl B. Gilbert. The company is to make a number of extensions and improvements and expects to have four double truck cars in Meriden shortly for the park line.

The City Council of Batesville has granted a right of way to the Batesville & Southwestern R. R. Co. from the south corporation line to the depot, along the right of way of the Illinois Central. This line is to be constructed by R. J. Darnell, of Memphis, Tenn., from Batesville to Charleston. It is hoped to have the line completed to Glenn's Ferry on Yocony River by the end of the year. Rights of way for most of the distance have been secured. The R. J. Darnell Co. also contemplates, erecting a sawmill, as it owns a large body of land on the line of the projected road.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The United Rys. Co., St. Louis, is to reconstruct its line from Taylor to De Giverville Ave., St. Louis, at an approximate cost of $120,000. Nearly four miles of concrete roadbed will be constructed and white oak ties laid.

Engineers under the direction of C. H. Evers of Seattle, Wash., have commenced a resurvey of the route of the Missouri Inland Ry., which will run from Rolla to Houston. The intentions of the engineers are to survey a route about three miles east of Rolla to Little Dry Fork Creek and thence to survey in a direct line to Dillon Station on the Frisco, about five miles east of Rolla.

The Terminal Board of St. Louis, composed of the various railroads having terminals in the city, is planning to enlarge the Madison freight yards at St. Louis. The capacity of this classification yard is to be increased from 800 to 3,200 cars.

Citizens of Philadelphia, Mo., have raised $4,000 of the necessary $10,000 to secure the construction of the proposed railroad through that place and a representative of the M. C. Conners Co., Chicago, Ill., who is to have charge of the work, has been in the vicinity looking over the right of way.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A. Guthrie & Co., St. Paul, Minn., have sublet part of the work on the construction of the Burlington branch line from Scribner, Wyo., to Fromberg, Mont., to Crosby, Willis & Welch, of Cowley, Wyo. The work on the branch includes grading and laying the steel for about 55 miles of track that will connect the Wyoming line with that of the Great Northern at a point a short distance west of Billings, and will begin at once, so that it may be completed before the beginning of the new year.

Advices from Helena, Mont., state that John Ringling, who is interested in White Sulphur Springs, will let a contract shortly for the construction of a railroad from Dorsey to the Springs.

Surveys have been completed for the construction of the proposed Northern Pacific cut-off from Edgeley, N. Dak., through Burnstad in Logan County, N. Dak., crossing the Missouri River, where it will cross the Cannon Ball line pass through Mott, and connect with the main line at Forsythe, Mont.

According to rumors afloat in the vinicity of Boulder, Mont., the Milwaukee is planning the construction of the line, surveyed last year from Jefferson Island to Helena, by way of Boulder.

The City Council of Butte, Mont., has been considering granting a franchise to the Butte, Anaconda & Pacific Ry. Co. for the construction of the proposed "Steward spur" from the Anaconda copper mine to the Parrot supply spur on the "Neversweat."

The City Council of Great Falls, Mont., has passed the resolution authorizing the constructing of the Chicago, Milwaukee & Puget Sound Ry., through the city. This line, according to an announcement reported to have been made by Charles E. Goodnow, Assistant to President Earling of the Milwaukee, is a portion of the 400 miles of road from Melstone to Missoula, mentioned recently in these columns.

Nebraska Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Beattie & Hubbard, Minneapolis, Minn., have placed one of their ditching outfits on the construction of 20 miles of ditch in the valley of Silver Creek in Merrick County.

The construction of a railroad from Madison, Neb., to Elgin is under consideration. At a recent meeting of the Commercial Club of Madison, Mayor W. L. Dowling, who is a member of the railroad committee, reported that the cost of a 45-mile railroad from Madison to Elgin along the survey of the Illinois Central made some 20 years ago, standard gage track with two steam locomotives, twelve freight cars, and two gasoline passenger and express cars could be built at upward of $500,000.

The Lincoln Traction Co., Lincoln, Neb., has authorized its special committee to spend $1,000 in a preliminary survey of the route of the proposed interurban line between that city and Auburn.

City Council of Fremont, Neb., is in favor of permitting the construction and operation of an interurban through that place from Omaha without demanding a royalty from the Interurban Company.

City Council of Omaha, Neb., is to hold a hearing at the next meeting on the request of the Burlington for the vacation of streets and alleys below Eighth St., from Jackson to Farnam, to provide room for the proposed large freight house the railroad is planning to erect.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Auburn & Syracuse Electric R. R. Co. has asked the city council of Auburn for a franchise out Genesee St., for permission to double track State and Genesee Sts. and to lay a double track in Seymour St. a distance of 300 ft.

The South Shore Traction Co., Times Bldg., New York city, which is building 54 miles of line in Queens, Nassau and Suffolk counties, on June 12 placed the first section of its line in operation. This section is nine miles long and runs from Amityville to Babylon. The route of the completed road will be from Patchogue to Blue Point, to Islip, to Bayshore, to Babylon, to Freeport, to Rockville Center, to Lynbrook, to Jamaica, to Long Island City and across the Queensboro bridge to Manhattan. Besides this main line there will be a cross island branch from Patchogue to Port Jefferson, 17 miles long, running through one of the most attractive sections of Long Island.

The Board of Estimate of New York city has granted the Third Avenue Bridge Co. of New York city an extension of time until Oct. 15 for the construction of tracks to connect the Third Ave. line with the Queensboro bridge.

The Lake Shore & Michigan Southern R. R. is said to have tentative plans under consideration for the improvement of its yards at Dunkirk. These plans are said to include the removal of the entire local yards eastward for several hundred yards.

The tunnel under Sylvan Hill near Terryville, Conn., was holed through on June 9. Work on the tunnel was started in 1907, but after excavating 300 ft. the work was stopped until June 17, 1909, since which date it has been rushed day and night. The tunnel will be lined with concrete and will be 32 ft. wide, double tracked, by 26 ft. high. The tunnel is 3,850 ft. in length and will form part of a new air line from Boston to the Hudson River, through which much of the freight on the New York, New Haven & Hartford R. R. from New England to the west will be forwarded. The tunnel straightens out the roadbed between Bristol and Waterbury, Conn., and shortens the route by about 1½ miles between those two points. The excavation required the removal of 4,600,000 cu. yds. of material.

The New York Central & Hudson River R. R. has applied to the State Public Service Commission for permission to construct a cut-off, branches and connections in the city of Rome, made necessary by the construction of the barge canal through that city. The plan proposes to change the location of the passenger station. It is understood that the work will involve the expenditure of $2,500,000, and that the proportion which the state will finally pay out of barge canal funds will be about $95,000.

The New York Central has acquired a site adjoining the Pennsylvania's new station, New York, for new terminals, and plans are being made for the construction of large warehouses with docks and freight terminals.

According to advices from New York, N. Y., the New York, Westchester & Boston, a subsidary company of the New York, New Haven & Hartford Ry., has decided not to take any definite steps toward the construction of the 45-mile line from White Plains to Danbury, Conn. The project will be indefinitely postponed, it is said.

North Buffalo Business Men's Association have entered a vigorous protest against the proposed new branch line from the main line of the Frontier Terminal R. R., to the International Bridge, Buffalo, N. Y.

The Interborough Rapid Transit Co., of New York City, has again asked for permission to third-track its elevated structures and has submitted a new plan of improvements to the State Public Service Commission. The company's proposals would entail an expenditure of $30,000,000, practically all of which would be spent on elevated lines. The company proposes to do this: To third-track the Second Ave. L from City Hall to 129th St. To complete the third-tracking of the Third Ave. L to Bronx Park. To build a two-track line from the Second Ave. line across the Queensboro Bridge. To build a connection between the east side elevated line in the Bronx and the West Farms division of the subway. To build a two-track line from Pelham Ave. to Becker Ave., the Bronx, as an extension of the Third Ave. line. To complete the third-tracking of the Ninth Ave. L to 155th St. To construct an extension to the Ninth Ave. line up Jerome Ave. to 194th St. To open the Steinway tunnel and transfer passengers to the subway free, providing a suitable franchise is obtained.

The State Canal Board at Albany on June 16 ordered that bids be asked for Contract No. 50. This contract is for the construction of a storage reservoir on West Canada Creek, about Hinckley, including dam with gatehouses, etc., the removal of buildings and incidental work. The area of the reservoir will be about six square miles. The engineer's estimate is more than $1,000,000.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Pennsylvania R. R. has submitted plans to the director of public service at Alliance for the Fifth St. subway. The plans call for a 50-ft. span, which will admit of sidewalks and a 34-ft. driveway. Plans show several proposed structures, costing from $22,000 to $30,000.

The commissioners of Fairfield County at Lancaster have decided to cut a new channel for the Hocking River and bids for the work will be asked shortly.

The Massillon-Brewster Air Line R. R. Co. has applied for a charter and proposes to build a direct line from Massillon to Brewster, the new terminal of the Wheeling & Lake Erie R. R. The officers of the company are as follows: J. J. Wise, President; Z. T. Shoemaker, Vice President; W. E. N. Hemperly, Secretary and Treasurer, all of Massillon.

Plans for changes in the tracks and the entrance of the Norfolk & Western R. R. into the city of Chillicothe, have been made and submitted to the City Engineer of that place. The plans for the new entrance to the city will necessitate a number of changes in streets.

Preliminary work has been started by the General Traction Development Co., of Cleveland, O., for the proposed new traction system from Mt. Gilead to Delaware, connecting Mansfield, Mt. Vernon, Marion, Galion and Delaware.

The Middle-West Engineering Co., Cincinnati, has been incorporated with a capital stock of $100,000. James E. Hewes is the principal incorporator.

Plans are under consideration for the construction of a hydro-electric development on the Cuyahoga River between Akron and Cuyahoga Falls. Engineers under the direction of Frank C. Downer, Chicago, Ill., have been securing data and measurements for the construction of a dam, 160 ft. deep, 250 ft. long at the base and 25 ft. wide at the top, built of concrete.

The Mahoning Valley Street Railway Co. has secured a right of way to construct a street railway from Youngstown to Mineral Ridge, five miles from there. Construction will be started soon.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

M. Parville and M. Brazon of Paris, France, representing the bond buyers who recently financed the Missouri, Oklahoma & Gulf extension from Muskogee to the Red River, in company with President William Kenefick, Kansas City, Mo., have been making a tour of inspection. Work will be started on the northern extension from Muskogee to Kansas City as soon as the survey is finished. French capitalists will also finance this end of the line.

A state charter was issued on June 14 to the Kansas, Oklahoma & Panama R. R. Co. for the new railroad out of Oklahoma City westward. The capital stock is $1,000,000. Headquarters will be at Oklahoma City, with branch offices at Sayre, Okla., and Indianapolis, Ind. The charter provides for two lines, one 135 miles in length from Oklahoma City westwardly through Oklahoma, Canadian, Grady, Caddo, Kiowa, Washita and Beckham counties, where it will connect at some convenient point, which may be either in Beckham, Washita or Kiowa counties, with a north and south line 180 miles along the southern boundary of Oklahoma north through Tillman, Jackson, Harmon, Greer, Beckham, Roger Mills, Ellis and Woodward counties. The directors are W. F. Crawford, Indianapolis, Ind.; Richard W. Ruffin, Hamilton, Ohio; D. B. Richardson, J. A. Whitehurst and G. L. Bennett, Sayre.

William Crooks of Dallas, Tex., in charge of a corps of 15 surveyors, has started from Oklahoma City to survey a railroad line from that city to Canadian, Tex. The proposed line will touch Hinton, Hobart, Sayre, Cheyenne and thence to Canadian. Eastern Oklahoma and Texas capitalists are interested.

The Atchison, Topeka & Santa Fe Ry. has awarded the contract for the grading of its new freight yards at Oklahoma City to John Acklin for $20,000. The yards will be situated north of 23rd St. and will cost about $250,000.

The St. Louis & San Francisco R. R. officials have decided in favor of constructing a spur to the proposed site of the Oklahoma Rod Company at Tulsa, Okla.

Officers of the Osage & Western Ry. are taking steps toward floating bonds for the construction of the proposed road from Pawhuska, Okla., to a point near Ponca City. Surveyors are now at work on the line pushing toward Enid. Clarence Walters, Claremore, Okla., Vice President and General Manager of the company, is reported to have announced that construction work would not be started this year.

The West Tulsa Belt Line Ry. Co. has been reorganized and as sufficient capital is now guaranteed it is expected that construction work on the proposed line will be started without delay. The following officers have been elected: J. S. Cullinan, President; J. E. Crosbie, Vice President; H. L. Stewart, Secretary and Treasurer; F. P. Dodge, Constructing Engineer.

The Cherryvale, Oklahoma & Texas R. R., promoted by Senator Porter, Caney, Kan., has decided upon a change of its route through the Cherokee Reservation. As originally planned, the line would run southeast through Dewey and Washington Counties, but now it is planned to locate a new town near Glenn, Okla., at the junction of the company's two lines.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The port of Toledo formed at a special election at Toledo, Ore., has secured an engineer, Eugene Schiller of Portland, to make a survey of the bay and prepare plans for a 14-ft. channel between Toledo and deep water at Yaquina.

The Mount Hood Railway & Power Co. has secured right of way for its projected 25 mile railway from Portland to Bull Run, where a power plant is now being constructed, and the electric line will be built in the very near future. Actual construction work on the line will probably be under way within two months. From Montavilla east the line will parallel the Base Line road on the north to Rockwood, thence to Gresham and Lusted's hill in almost a straight line. From Lusted's hill the road will head for Bull Run in as straight a line as will be permitted by the contour of the land, which in that district becomes quite rugged. The tracks will cross Sandy River at a point above the confluence of the Bull Run River with the Sandy, over a cantilever bridge 2,000 ft. long, including the approaches. The longest span in the structure will be 140 ft. and it will be strung 80 ft. above the water of the stream. C. M. Raser, Sweetland Bldg., Portland, Ore., is chief engineer.

Charles Johnson, Seattle, Wash., who has a subcontract for grading between Crescent, Ore., and Carroll Springs on the Oregon Trunk Line, has established a construction camp at Crescent.

Surveys have been completed for the projected electric line across the Coast Range to Tillamook, and contractors have been over the route. This line is to be built for the United Rys. Co., of which John F. Stevens, Portland, Ore., is president. Two more electric line surveys have also been approved, these being the extension from Salem to Albany and from Tigardville to McMinnville. Between Salem and Albany the distance is about 50 miles and between Tigardville and McMinnville about 20. The United Railways Tillamook extension will require approximately 80 miles of new work.

F. B. Kidder, Eugene, Ore., one of the promoters of the Lane County Asset Co.'s proposed line between Eugene and Coos Bay, Ore., is preparing to direct the beginning of the survey from Marshfield.

Committee of citizens of Marshfield, Ore., who have charge of raising the required $150,000 bonus for the construction of the Coos Bay, Oregon & Idaho R. R. are making good progress and it is expected that the amount will be at hand in a few days.

The Bellingham & Skagit Ry. Co., of Portland, Ore., has been incorporated with a capital stock of $1,000,000 and proposes the construction of a new line. The promoters of the project are Charles M. Drummond, Josiah H. Drummond, Clark D. Chapman, of Portland, Ore.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Charles Crumbling, York, has begun work at McSherrystown on his grading contract for the trolley line at that place.

The entire route for the projected interurban line of the Fairmont-Pittsburg Traction Co. has been surveyed and much of the right of way secured. Construction work on some of the sections is also under way. The road is to extend from Fairmont, W. Va., to Pittsburg, 80 miles. The company has recently taken over the rights, franchises and charters of the Waynesburg & Monongahela Electric Ry., which covered Waynesburg, Marianna and Carmichaels on the Monongahela River. Another line has been secured from Morgantown, W. Va., extending in a northwesterly direction to Blacksville, and another line branching out from Fairmont to Mannington, W. Va., and thence north and east of Blacksville, while a straight line, running due north from Fairmont, passes through Blacksville on the state line of Pennsylvania and West Virginia and continues through Greene and Washington counties, by way of Waynesburg, Ten Mile, Lone Pine, Snodgrass and Bridgeville to Pittsburgh. W. M. Laws, Fairmont, W. Va., is president.

McCourt & Herndon, Akron, O., have started work on their subcontract on the Western Maryland R. R. extension at Ohiopyle, Va. Their contract calls for grading and concrete work for four miles of line and amounts to about $200,000. Over 100 men will be employed.

Extensive improvements are stated to be planned for this summer in the Pittsburg district by the Pennsylvania, the Pittsburg & Lake Erie and the Monongahela R. R. The work involves the construction of a bridge over the Monongahela River, near Brownsville Junction and new classification yards by the Pennsylvania, the elevation of the yard at Red Stone to a new grade by the Pittsburg & Lake Erie and the erection of a 70-ft. concrete arch by the Monongahela. The bridge alone will mean the expenditure of $750,000. It will be a double track affair and have a channel span of 450 ft. The Pennsylvania, the Pittsburg & Lake Erie and the Monongahela railroads are to share in the cost of the improvement, which is to benefit Brownsville Junction and Red Stone. The chief feature of the work is the construction of the bridge. It will be 10 ft. higher than the structure it is to replace and will be of unusually heavy construction. It will require 10,000 cu. yds. of masonry, among other things. The building of the bridge at a greater height than the present one has made necessary the changing of the grades at the yards at either end by the three railroads that use it. The concrete arch will carry the tracks over the approach, which crosses a roadway. The Pennsylvania in the classification yard it is to build will have 30 tracks, each half a mile long. The yard will be operated on the gravity system. The Monongahela railroad will carry out an enlargement of its yards which has been contemplated for some time. In all there will be required 300,000 cu. yds. of fill to properly ballast the new treminal point where the three roads exchange freight. The work, which has been planned under the joint supervision of the engineers of the three roads interested, will be done as a single contract. The three roads will jointly own the bridge, the construction of which will call for several thousand tons of steel.

A. De Mayo & Co., New York City, have construction work well along on the Slippery Rock & Grove City Street Ry. line and it is expected that the track between the two towns will be completed in four months. Location surveys for that portion of the line between Slippery Rock and Butler have been completed and bids for the construction of this link will be asked shortly. This link will give a connection with the Pittsburg, Harmony, Butler and New Castle lines in Butler. The line as surveyed runs through West Liberty, Isle, Prospect and via Mount Chestnut to Butler. It is reported that rights of way have been procured north of Grove City to Stoneboro and Sandy Lake. Eastern capitalists are working with the Slippery Rock & Grove City Street Railway Co. and will build to Meadville, thus giving electric railway service from Pittsburg to Buffalo via Erie. H. B. Graves, Butler, Pa., is Chief Engineer.

O. M. Hoffman, Columbia, is now selling the stock for the proposed Ephrata & Lebanon trolley line. It is stated that this work will require a month or two after which construction work will be started.

The Pennsylvania R. R. is reported to be securing right of way from the new town of Besco, on the north side of Ten Mile Creek, to Marianna, a distance of 4½ miles. The company has already built the line from Millboro to Besco, a distance of 2½ miles.

The Monongahela & Southwest R. R., it is said, will start work shortly on the construction of the proposed line from a point near the Wabash R. R. property in Snowden Township and will connect with a point on the Baltimore & Ohio R. R., opposite the Glenwood yards on the Monongahela River. Surveys for the proposed road have already been completed.

Surveys have been completed for the construction of the proposed Monongahela Short Line R. R., from a point on the Baltimore & Ohio Railroad in Snowden Township, to a point on the Pittsburg, Virginia & Charleston R. R., in Homestead. It is expected that work will be started shortly.

South Carolina Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys have been completed for the projected interurban line of the Greenville, Anderson & Spartanburg Ry. Co. of Greenville, S. C., and the towns of Greenwood, Abbeville and Due West are bidding for the line. It was found that the line by way of Abbeville was two miles shorter than via Greenwood. The cost of the two, however, the engineers reported, would be about the same. Both towns have offered very substantial inducements to the promoters of the railway. Due West also is making a strong bid for the line. To carry

it through Due West would make it four miles longer than through Abbeville.

South Dakota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The County Commissioners at Elk Point, S. Dak., have awarded the contract for the construction of the Dennison ditch to the Sherwood Dredging Co., of Alexandria, Minn., for 14¼ cts. a cubic yard. This ditch is located four miles east of Elk Point and is 4½ miles long, with a yardage of 45,000 cu. yds. Work is to commence within 30 days, and is to be completed by Dec. 1, 1910.

The Chicago, Milwaukee & St. Paul R. R. has purchased the "Soo" right of way through the corporate limits of Aberdeen, S. Dak., and will use it to add to its trackage facilities there.

Advices from Pierre, S. Dak., are to the effect that the Chicago & Northwestern Ry. Co. has filed with the state Land Department a plat showing the proposed route of the projected line from Dallas through Tripp County in a northwesterly direction to the southeast corner of Mellette County.

Surveys have been made for the construction of the proposed railroad from Sioux Falls, S. Dak., to Wheeler, on the Missouri River, Charles Mix County. The promoters of the project, who are business men of the first town, are now seeking financial aid to carry out the plans.

The Nebraska & Dakota R. R. Co. has filed articles of incorporation with a capital stock of $4,500,000 and headquarters at Pierre, S. Dak., and proposes the construction of a line from Murdo, S. Dak., to Burwell, Neb., through the counties of Lyman, Mellette, Todd and Tripp, S. Dak., and Rock Loup and Garfield, Neb., a distance of 180 miles. The incorporators are Martin B. McWilliams, Paul Miller, J. H. Christensen, Samuel C. Ware, Charles J. Reublin, Chicago, Ill., and L. L. Stephens, Pierre, S. Dak. Surveys for the proposed line are already under way and right of way is being secured.

Tennessee Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Memphis Street Ry. Co., T. H. Tutwiler, president, Memphis, Tenn., has filed an application to amend its charter giving it power to make many improvements at Memphis. The company plans several important changes including the construction of several cross city lines.

Bids were opened June 9 by J. L. Lancaster, president of the Memphis Union Depot Co., Memphis, for the construction of the union depot. The bids ranged from $550,000 to $600,000, the following contractors bidding on the work: Selden-Breck Construction Co., Memphis; Olsen & Lesh, Memphis; the Hedden Construction Co., New York city; James Stewart & Co., St. Louis, Mo.; Geo. A. Fuller Co., Chicago, Ill.; John M. Ewen Co., Chicago, Ill.; Noel Construction Co., Baltimore, Md.; Murch Brothers Construction Co., St. Louis, Mo.; Westlake Construction Co., St. Louis, Mo.; Rommer Brothers, Louisville, Ky., and the C. L. Gray Construction Co., St. Louis, Mo. The specifications call for front and side walls of stone and concrete, with rear walls of dark buff or slate colored pressed brick. All interior woodwork will be of mahogany or of that finish. Ceramic mosiac floors will be laid in the drug store, barber shop and billiard room on the first floor, while marble slabs will pave the general waiting room and main hall. The approaches to the general waiting room and floors of the terraces, including the porte cochere, will be paved in red French flint tile. The interior walls of the building will be finished in terra cotta or tile, with marble bases and trimmings, where solid marble walls are not otherwise specified.

W. J. Oliver, Knoxville, has started work on the erection of the new dam across the Watauga River for the Watauga Power Co., of which Lee F. Miller, Elizabethton, is President. The dam will be 50 ft. high and it is said will develop about 3,000 HP. The power has been contracted to the Bristol Gas & Electric Co. and will be transmitted over its lines to consumers. About 7,000 bbls. of cement will be required for the dam.

Mass meetings have been held at Alamo to raise funds for a new railroad. The road is to run from Dyersburg via Banicord, Friendship, Crockett Mills, Alamo and Bells or Fruitvale on to Jackson. It is understood that Crockett County is to raise $75,000 to help build the railroad.

The City Council of Harriman has granted a right of way to the Harriman, Knoxville & Eastern R. R., along Emory St. from its intersection with Roane St. to its intersection with Cumberland street at the eastern side of the city. The ordinance also provides for the closing of certain streets at their crossing with Emory St. It is proposed to commence the construction work within six months and complete it within 18 months and have trains in operation. The ordinance was presented by H. W. Winslow, W. A. Rockwell, and C. T. Cory as composing the Haarriman, Knoxville & Eastern R. R. Co., which has just applied for a charter.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A proposition is to be submitted to the promoters of the Terrell-Dallas Interurban R. R. Co. to have the company select a route north of the Texas & Pacific track between Dallas and Forney for a line. The route as now surveyed is by way of Scyene instead of Forney. C. L. Wakefield, Trust Bldg., Dallas, is one of the promoters.

The Holland-Texas Dam & Irrigation Co. of Cotulla, has been incorporated with a capital stock of $23,000, the incorporators being J. J. Newton, J. C. Cameron and J. W. Patterson.

The present status of the Tucumcari, Portales & Gulf R. R., which projects a line from Tucumcari, N. Mex., to Del Rio, Tex., is said to be about as follows: Surveys have been made, 50 miles of right of way secured and $350,000 in cash has been put up. The line is more or less located through the counties of Bailey, Cochran, Yoakum, Gaines, Andrews and Winkler to Pyote. From Pyote the projection is to be to Del Rio, without any definite route in view as yet. The first work to be done will be the building of a 57-mile section from Texico to Farwell. Contracts have also been let for grading and track laying on 50 miles running north of Pyote, Texas, and through the irrigated belt of Fort Stockton, another section running south from Pyote will be built. Surveys extending from Texico to the Rio Grande and to Faulkner, Mexico, have been completed.

The Houston Electric Co., Houston, is to expend $700,000 this year in improvements. Of this sum $75,000 will be expended for extending the South End line to the Rice Institute.

The Espejo Land & Irrigation Co., of San Antonio, has been incorporatd with a capital stock of $64,000, the incorporators being B. F. Nicholson, W. B. Tuttle and Frank Curtiss Smith.

J. F. Edwards has been elected President of the San Antonio, Rio Grande & Tampico R. R. to succeed A. B. Heddon of New York. The change is said to mean that more money will be put into the construction of the road at once. The road is being built from San Antonio to the Rio Grande, and will be eventually extended to Tampico and has been constructed for about 30 miles. Mr. Edwards was the original promoter.

The Commercial Club of Brownwood, Tex., is taking vigorous steps to secure the construction of the proposed Cleburne-Coleman R. R. to that city instead of Coleman.

Advices from Stamford, Tex., state that Col. Morgan Jones is attempting to purchase the Estacado & Gulf R. R. of W. A. Butts, with the intention of extending it from McCauley, the present terminus, to Handley and Snyder. At present Jones has a line under construction from Hamlin to Anson, which he will extend to Abilene to connect with the Abilene & Southern at that place.

The Chamber of Commerce of San Angelo, Tex., and T. K. Wilson and J. A. Loomis, large land owners on the Lipan Flat, about 20 miles south of the city, are taking up the matter of securing the construction of a railroad into that section of the country, which is one of the most densely populated farming sections in Texas.

The Missouri, Oklahoma & Gulf R. R., which is building into Denison, has laid rails to within 8 miles of Red River, and grading outfits are at work between the city and the stream. The bridge has already been completed.

The Port Brownsville Sugar Lands Co., which has acquired 51,000 acres of land near the mouth of the Rio Grande, has had surveys for a large main irrigating canal and laterals and will put all the land under irrigation. This is said to be but a part of a scheme for establishing a deep water port to be known as Port Brownsville. Edwin S. Brodnix, St. Louis, Mo., and R. L. Still, Brownsville, Tex., are interested. In addition to the reclamation project and the new port, it is understood that allied interests are contemplating a railroad to San Antonio from Port Brownsville and a system of interurban railways throughout the valley.

The award of the Commissioners fixing a price of $200,000 for the land for the dam site and lake for the construction of Elephant Butte dam and the reclamation by irrigation of 220,000 acres of land in the vicinity of El Paso has been approved, thus removing the last obstacle to the work. The work will be done under the direction of the U. S. Reclamation Service.

The Gulf, Texas & Western Ry. is said to be planning to secure an entrance to Weatherford. The building of 15 miles of track is necessary between Graford and Jacksboro to give the Gulf, Texas & Western an entrance into Weatherford over the line of the Weatherford, Mineral Wells & Northwestern, and negotiations in that direction are pending with, it is said, strong probabilities of success.

The Houston & Brazos Valley R. R. has filed with the Texas Railroad Commission formal application for an inspection and valuation of a 4-mile extension from Velasco to the Lighthouse, also additions and improvements, with a view of issuing bonds.

Surveys were started June 11 on the proposed line of the recently chartered Nuexces River Valley Ry. Co., by G. A. Hall, C. E., Philadelphia, Pa. As planned the road will extend from Beeville, Texas, to Eagle Pass, touching six county seats. Beeville, which is to be the headquarters of the company, has raised the necessary cash bonus and site for the terminals.

Preliminary surveys are now under way between Vernon, Tex., and Miami, a distance of 200 miles, for the proposed railroad from the Texas Panhandle to the Gulf. George W. Angle, of New York, is representative of the financial interests.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The promoters of a projected interurban line between Ogden and Logan, accompanied by Engineer Carl Schaub of Logan, have been through Blacksmiths Fork canyon with a view to selecting a site for the electric plant. The canyon is about eight miles south of Logan near the proposed route of the road. David Eccles and M. S. Browning, Ogden, are interested in the line.

The Ogden Rapid Transit Co., Ogden, is to extend its Ogden canyon trolley line through to Huntsville and other points in Ogden Valley. The line already runs as far as the Hermitage in Ogden Canyon, seven miles from Ogden. The extension will carry the road seven miles further, passing through one of the most fertile valleys in Utah.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city council of Richmond has extended the time for completion of the new Church Hill viaduct and the proposed lines of the Richmond & Henrico Ry. Co. for six months from June 30. The Richmond & Henrico Ry.

Co. is the holder of the rights and franchises of the Citizens' Rapid Transit Ry. Co. Part of the line is already completed. The company has secured a site for a power house at Louisiana street and contracts for $80,000 of machinery have been let. G. W. Trafford is engineer for the power house and W. S. Forbes, Richmond, is president.

The council committee on streets of Richmond is now considering a proposition of the Virginia Railway & Power Co. of Richmond with reference to the contemplated extension of the railway lines.

A Philadelphia syndicate has purchased a large amount of property fronting on the Boonsboro Turnpike, beyond Rivermont, involving the frontage of the Presbyterian Orphanage estate, lying in Campbell and Bedford counties, and has obligated themselves to give these properties trolley car facilities within two years. It is also stated that several Northern capitalists have been in Lynchburg recently going over the city with a view of establishing a second street railway system there.

The Norfolk & Western Ry. has plans under way for the construction within a year or two of a large steel pier at Lamberts Point near Norfolk, for its coal business.

Advices from Suffolk, Va., state that a new railroad is proposed to run across the counties of Southhampton and Sussex. The preliminary survey has been completed between Pope, on the Southern Railway, and Lumberton, in Sussex County. This distance is 12 miles, but it is expected the road will be extended to about 30 miles. The Churchland Manufacturing Co. is one of the chief promoters of the line.

The construction of a 60-mile electric railway in Lee and Wise Counties is proposed and W. G. Coults, of the Board of Trade, of Big Stone Gap, Va., has gone to Goderich and Toronto, Canada, to interview capitalists in an effort to interest them in the project.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

According to a report of the engineer in charge of the preliminary survey the proposed high line canal, which will water 300,000 acres in Yakima and Benton counties, will cost $26,000,000, or about $86 per acre. The canal is considered entirely feasible.

The Occidental Fish Co., W. B. McDonald, president, Seattle, has had work started on a large fish dock on Western avenue, at the foot of Bay street, Seattle. The total cost of real estate and improvements will be $300,000. The pier will be 250 ft. long and 62 ft. wide. It will have two stories and the roof will be entirely supported by the walls, no pillars cutting up the floor space.

An ordinance has been before the City Council of Spokane to grant a franchise to the Chicago, Milwaukee & Puget Sound Ry., and the North Coast R. R. for the erection of a union station on the site on north side of Front Ave. between Howard and Washington. The improvement will involve the expenditure of $1,000,000 by the two roads, exclusive of their right of way. In the franchise it is stipulated that construction must begin on the depot within six months after passage of the ordinance, and that the depot must be completed within three years. The railroads are given the right to erect the structure projecting over the north sidewalk on Front St., but must keep the sidewalk open beneath. The roads agree to construct concrete or masonry retaining walls on all their embankments and fills exposed to view on Front Ave. between Post and Center Sts. All viaducts over streets shall be of steel, concrete, or a combination of the two.

Harry White, Seattle, Wash., President, Alaska Anthracite Coal & Railway Co., is reported to have announced that surveys and plans have been made for the proposed line and the necessary funds for construction secured. The main line will start from Controller Bay, follow the Bering river, pass Stillwater and into Carbon mountain, a distance of about 22 miles. Branches will be run off the main line 10 miles to Bering Lake coal fields, where McDonald's mine is located, and to other mines. A large part of our preliminary work has been in the hills and mountains, and our survey is now complete to the ocean.

Construction work is being pushed with the utmost rapidity on the double tracking of the Northern Pacific's main line from Tenino to Kalama, Wash. Track between Chehalis and Centralia has been thrown open for operation and it is expected to finish the line from Centralia to Bucoda shortly. There are at present 17 steam shovels at work along the line and between 1,700 and 1,800 men are employed either on the grading or track laying. By November 1 it is hoped to have the double tracking entirely done.

H. C. Henry Contracting Co., Seattle, Wash., plans to complete the Moncton-Everett line for which it has the contract from the Chicago, Milwaukee & Puget Sound Ry., by January 1, 1911. About all right of way has been secured.

Over 200 men are at work on the 12½-mile contract of the Grays Harbor & Puget Sound Ry. from Cosmopolis to North River clearing and grading for reconstruction.

The city of Hoquiam, Wash., and Grays Harbor & Puget Sound Ry., a subsidary company of the Union Pacific, have agreed as to the right to cross the Hoquiam River at Simpson Ave. The railway company and city will erect bridge piers jointly, the former to construct its bridge at once and the city to build its structure at some future date. This will end the trouble existing for several months, and will give the Union Pacific a franchise through the city of Hoquiam.

The City Council of Hoquiam has awarded the contract for filling a large slough to M. D. Hogan, Hoquiam, at 44½ cts. per cu. yd.

West Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

According to a statement of T. Moore Jackson, at Clarksburg, W. Va., actual work on constructing the Middle Island Railroad will begin in a very short time. The construction work will be started at Sistersville and the first section to be completed will be that between Sistersville and Middlebourne. This is expected to be completed this summer and put in operation at the earliest possible date. As soon as that section is placed in operation the road will be extended up Middle Island creek to the headwaters and over the divide to Salem. All of the districts in Tyler county through which the proposed road passes have voted to take the bonds required.

The construction of 26 miles of electric railway from Beverly to Zanesville, O., thus completing the connecting link for Parkersburg to the Great Lakes, is proposed. H. D. Blodgett, of Zanesville, O., a constructor of electric lines in Ohio, was in Parkersburg, W. Va., recently in conference with some West Virginia and Eastern capitalists relative to building the line.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The city council of Manitowoc has passed orders for the docking of the river to protect the channel leading to the Rock river dock of the Soo line, and 500 ft. of dock to cost approximately $12,000 are to be built.

The State Railroad Commission of Wisconsin, Madison, Wis., has instructed the Chicago & Northwestern Ry. Co. to extend its tracks up on the land of the Union Lime Co., to the plant of the Eden Co.

The State Railroad Commission, Madison, Wis., has issued a certificate of Convenience and Necessity to the Prairie Farm & South Western R. R. Co. (Badger Short Line) to construct a railroad between Prairie Farm and Emerald, Wis., a distance of 16 miles, connecting at the latter place with the Minneapolis, St. Paul & Saulte St. Marie. George E. Scott, Prairie Farm, Wis., is President of the company.

The Ontario & Northern Ry. Co. has been incorporated with a charter of $75,000 and proposes to build a railroad from the village of Ontario in Vernon County to the village of Wilton in Monroe County, a distance of about eight miles. The directors are V. A. Stoddard, C. W. Lord, A. T. Saunders, L. R. Abbott, C. M. Sundon, H. Timmerman, Ed. Stockman, L. R. Walker, E. E. Lord, S. Sloggy, F. G. Bredlow and Levi Wallace of Ontario and Howard Teasdale of Sparta.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city commissioners of Calgary, Alberta, have accepted the routes for a number of extensions of the Municipal street railway system. The city engineer will make an estimate of the cost of the work. The extensions will mean that two new bridges will have to be constructed, one across the Elbow at the end of 2d St. east, and the other across the Elbow at the east end of 12th Ave.

The Canadian Pacific Ry. has announced its decision to continue double-tracking the main line between Winnipeg and Brandon. It was only intended to go to Portage this year, but the graders have been ordered to go on to Brandon, 150 miles.

The Highland Navigation Co., Winnipeg, propose to construct a wharf at the foot of Matheson Ave., in that city.

Contracts for the lines of the Canadian Northern R. R. to the Brazean coal fields from the south of Stettler and the line from Edmonton to the Yellowhead Pass are to be awarded shortly. In the one case the delay is caused by the non-completion of the final survey and in the other case by non-approval of the route plan by the railway commission. The line to the Brazean coal fields will start at a point south of Stettler and run in almost a straight line to destination. The line from Edmonton will run north of the Grand Trunk Pacific, some little distance in order to serve county not tapped by the G. T. P.; but when nearing Wolf Creek, the two lines will come close together, and the C. N. R. will possibly touch at Edson, but this cannot be stated definitely as the route plans have not been approved.

The Canadian Northern Ry. completed track laying from Camrose to Stettler on June 13.

According to the annual report of the National Transcontinental Railway Commission for the fiscal year ending March 31 last 63 per cent of the grading on the whole line of the Transcontinental Ry. from Moncton to Winnipeg is now finished and 45 per cent of the bridging. During the last fiscal year 521 miles of track were laid, the total track mileage on March 31 totalling 760, with an additional 165 miles of sidings. At the present date steel is laid on about half of the distance from Moncton to Winnipeg. Construction work is being vigorously pushed this summer on every section of the line, and it is expected that the road will be ready for through traffic in August or September of 1912. The line from Winnipeg to Fort William will be opened for regular traffic next August. The total expenditure on the road up to the end of the fiscal year was $71,137,993, of which $53,850,000 was for grading, $7,201,000 for rails and $8,237,038 for engineering and expense.

The Canadian Pacific Ry. Co. is preparing to continue the double tracking of the line between Portage and Brandon. J. C. Hargrave & Co., who recently completed subgrade work on the section of the line from Winnipeg to Portage, have been instructed to continue west and will proceed at once. The completion of this work will give the C. P. R. 522 miles of double track from Fort William west.

Efforts are being made to rush to completion the construction work on the National Transcontinental Ry. east of Superior Junction. The Commission has sent notices to the contractors fixing time limits on the work. Foley & Welch have already laid 26 miles of steel east of Cochrane, but are being held up temporarily by the bridge across Mistango River, now under construction. The grade is ready for a additional 52 miles of steel. Considerable steel has been laid west of Quebec and M. P. Davis has 50 miles graded. In the La Tuque district 100 miles of track have been

completed. West of Cochrane steel is down as far as Groundhog River, and an additional 100 miles will be laid by fall.

Vickers' Sons & Maxim, English shipbuilders, have filed plans at Ottawa for a $2,500,000 shipbuilding and repair plant to be located at Montreal. The plans include a floating dry dock, three large berths for the repairing and building of steel vessels, machine shops and a plant capable of doing the heaviest construction and repair work and covering some 50 acres of ground.

John Armstrong, Ottawa, Dominion Government Engineer in charge of the Hudson's Bay Railway Surveys, has gone to the Pas, where a considerable amount of preliminary work is being done in connection with the construction of the railway bridge across the Saskatchewan. Plans have been completed for a bridge, which, it is understood, will be similar to the one at Prince Albert. These are now in the hands of the department at Ottawa, and tenders will be called for as soon as they have been approved. It is expected that work will be started next month.

A street railway system is projected for Welland, Ont. C. J. Laughlin has applied for a franchise and proposes to have the line completed in five months. He will have tracks on both sides of the canal, also to Welland Junction.

Construction work will be started, it is said, in a few days on the Canadian Northern Ry. line from Strathcona, Alta., to Camrose, forming the final connecting link on the colonization extension which will join Strathcona and Calgary next summer. Contractors will push the line about 24 miles this fall. Right of way is already being secured. T. Turnbull, Winnipeg, Man., is Assistant Chief Engineer of the company.

The Canadian Northern Ry. has about completed the survey of the main line from Edmonton to the Pacific coast with some changes from the original route to gain better grades. The company is also about ready to construct a line from Victoria to Barclay Sound on Vancouver Island, a distance of 120 miles. Tenders closed June 15 for the first 60 miles of the main line east, from New Westminster to Chilliwack. The contractors will be given one year to complete this work, a small part of which is in rock.

The promoters of the Peoples Ry. Co. have been drawing up an agreement with the city of Guelph, Ont., for the proposed radial road, to be built between Guelph and Berlin. A by-law providing for the taking of $60,000 stock in the road by the city of Guelph will probably be submitted shortly to the ratepayers.

The Canadian Government steamer Stanley has sailed from Ottawa for Hudson Bay with two parties to make hydrographic surveys at Port Nelson and Fort Churchill. The report of these surveyors will determine the location of the deep water terminus of the Hudson Bay Railroad, the first contract of which will shortly be let by the Canadian Government. W. J. Stewart, head Canadian hydrographic surveyor, will have charge of the work, which will be divided between two parties, one under H. B. Pariseau and the other under A. A. G. Bachand. One party is assigned to Churchill and the other to Nelson.

The Government of Nova Scotia has granted a charter to a Canadian and London syndicate for the construction of the long projected Eastern Railway from a point on the Intercolonial at or near Dartmouth to Guysboro, with branch lines to points on the Intercolonial Railway at or near New Glasgow, and also to Country Harbor, in the county of Guysboro, and much other branch lines as the governor in council thinks fit. The proposition for the construction of the railway and branches has been made by John Bogert Bartram of Toronto, barrister; Thomas B. Fogg of Toledo, Geo. H. Raw and Sigmund Hirsch of London, England, brokers. The head office is to be in Halifax or such place in Nova Scotia as the directors determine. The capital stock of the company is to be $3,000,000. The company is to have free right of way over crown lands, and the charter is to cease unless the company be actually organized and engaged in business in two years. It is expected that the contract for the construction of the road will be signed in a few days. The syndicate has also practically completed the purchase of the Alfred Dickie Company's timber limits in Halifax and Guysboro counties.

The city council of Quebec has decided to sell the Champlain market property for $100,000 to the Transcontinental Railway Commission for a terminal site. The deeds will be signed before Sept. 1.

Mexican Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

S. Pearson & Sons, Ltd., City of Mexico, have about completed the exploration work in connection with the Nazas River dam project for the Laguna irrigation system which is to be constructed for the Mexican government. A site has practically been settled upon at Caja Pinto, where at a very satisfactory depth, there is every indication that a perfectly good and safe foundation has been found, and it will be but a short time before all operations are concluded to complete the plans for foundation as presented to the government by Frederick Adams, City of Mexico, the managing director of the construction department of S. Pearson & Sons. The dam when it is constructed, will have a storage capacity of 1,800,000,000 cu. meters of water. It is planned to hold sufficient water to more than irrigate the entire Laguna district and enable the planters there to double the yield of cotton per acre.

Work on the Conchos River dam and railway line mentioned some time ago in this paper, has been making good progress. The contractors, S. Pearson & Son, City of Mexico, have just completed the railroad, which is of standard gage, connecting La Boquilla, the town at the dam site, with Santa Rosalia, on the National Railways of Mexico in the state of Chihuahua. The total mileage of the road is 31 kilometers. The contractors have also completed the erection of 300 houses for the laborers at La Boquilla. The dam will be one on the largest in the world, exceeding in size both the Gatun and the Necaxa. It will have a capacity larger than either of the former and will be equipped with the most modern and expensive machinery. The dam's spillway will be cut through the hill, necessitating the excavation of about 250,000 cu. meters of rock, the bulk of which will be used in the construction of the dam.

The Grant Brothers Construction Co. of Los Angeles has been rushing materials and supplies for the Southern Pacific extension in Tepic across the Santiago River in anticipation of the early opening of the rainy season. The first high water in the Santiago River is expected to carry away the temporary bridge built across that stream at a point fourteen kilometers from the town of Santiago Ixcuintla, and after that it will be impossible to transport heavy supplies across the river until such time as another temporary bridge can be built at the close of the rainy season in the fall. The contractors expect to carry on construction work during the rainy season.

The Mexican government has granted a concession to V. Mistretta of Galveston, Tex., to construct a railroad through the heart of the banana-growing territory of Tabasco. Mr. Mistretta is financing the road in the United States.

Griffiths & Co., an English concern, have secured the contract for the construction of the New Chilian Ry. at $21,250,000. The railway will ultimately form part of the Pan-American Railway System which is to extend from New York to Valparaiso; but the present contract is in respect of the southern section of the Longitudinal Railway of Chili. It is to be constructed between Cabildo, north of Santiago, and Toledo, near Copiapo, a distance, in all, of 620 kilometers, or about 400 miles. At this point the northern section of the Longitudinal Railway starts, and runs thence to the port of Arica, continuing to La Paz, the capital of Bolivia, which portion of the line is also being constructed by Messrs. Griffiths & Co. in conjunction with Sir John Jackson (Chili), Limited. The route of the southern section has been surveyed by the Government engineers, and work on it has already been started by the Government of Chili. The rails to be used are calculated to weigh 35,160 tons, which will cost about $1,000,000. Tenders will be invited for this contract, and also for supplying some 40 locomotives, 300 goods trucks, and 50 passenger carriages. The construction of the railway, which will have a gauge of 3⅜ ft., involves 14,000,000 cubic yards of earthwork, 3 1-3 miles of tunnelling operations, and nearly three miles of bridges.

The Baltimore & Ohio R. R. has compelted plans for the beginning of construction work on the improvements that are to be made at Frederick, Md. Work will be started, it is thought, about July 1st.

Bids were opened June 15 at the office of the Isthmian Canal Commission, Washington, D. C., for building and erecting lock gates for the Panama Canal. The contract calls for about 60,000 tons of steel. There will be 46 mitering gates of two leaves each. The locks on the canal will be located at Gatun, Pedro Miguel and Miraflores. There will be 10 locks at Gatun, 6 at Pedro Miguel and 7 at the last named place. The locks will be 130 ft. wide and each gate 65 ft. wide, and nearly 7 ft. thick. The bids received were as follows: McClintic-Marshall Construction Co., of Pittsburg, for $5,374,474; the United States Steel Products Exports Co., $6,100,000 and $6,200,000; the Maryland Steel Co., $8,409,368, and Riter-Conley Manufacturing Co., of Pittsburg, $10,183,257.

Surveyors of the El Paso & Southwestern R. R. Co., running a line from Benson to Winkelman, have compelted their work to Mammoth, within 20 miles of Winkelman, Ariz. Thus far the new survey lies entirely on the west side of the San Pedro River. C. S. Henning, Jr., Tucumcari, N. Mex., Assistant Engineer, is in charge of the work.

Delegations composed of business men of Columbus and Mineral Springs, Ark., are taking up the matter with the officials of the Magnolia & Northern R. R. Co. of constructing their proposed line. The road as projected will run from Magnolia, through Hope De Queen via Columbus, Mineral Springs and other points. S. A. Sevier, Hope, Ark., is interested in the project.

BIDS ASKED

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Visalia, Cal.—Until July 12, by Morve L. Weaver, City Engineer, for the construction of reinforced concrete conduit and bridges in this city. The work is estimated at $80,000.

Washington, D. C.—Until 2 p. m., June 27, by District Commissioners for the construction of a concrete and rubble arch bridge on the line of Peach Driveway, Rock Creek, above Military Road.

Columbus, Ga.—Until noon, July 18, by W. C. Campbell, Superintendent Public Works, for the construction of a concrete steel arch bridge over the Chattahoochee River at Dillingham St. The structure is to be of the Melan System.

Sturgis, Mich.—Power House and Dam.—Until 7 p. m., July 6, by Board of Public Works, for the construction of a power house and dam. J. S. Flanders is Manager. Gardner S. Williams, Ann Arbor, Mich., is Consulting Engineer. Official advertisement will be found elsewhere in this issue. Also noted under Confirmed Reports.

Chisholm, Minn.—Water Tank.—Until July 6, by J. G. Hirsch, for the construction of a 300,000 gal. elevated steel water tank. Daniel W. Mead, Madison, Wis., is Engineer.

Ellendale, Minn.—Well.—Until 8 p. m., June 28, by C. R. Torgeson, Village Recorder, for drilling a deep well for the village.

Fort Slocum, N. Y.—Vessel Repairs.—Until 11 a. m., June 22, by Peter Murray, Capt. and Quartermaster, for installing new sectional boiler surface engine, hull and deck repairs on the steamer General Barry.

West Point, N. Y.—Steam System.—Until 2 p. m., July 6, by Quartermaster, for the installation of a steam distributing system.

Ellis Island, N. Y. H.—Elevator.—Until 2:30 p. m., June 29, by William Williams, Commissioner of Immigration, for necessary labor and material required for the installation of an elevator in the tower of Main Bldg., Ellis Island.

Cleveland, O.—Power Plant.—Until 2 p. m., June 29, by John J. Boyle, Secretary County Building Commission, for the following: "A" The construction of a power plant building. "B" The installation of equipment therein. "C" The construction of a tunnel. "D" The installation of steam pipes and electrical cables connecting said power plant with said court house building. "E" The construction and installation of condenser lines and equipment.

Waynesboro, Va.—Stand Pipe.—Until noon, July 6, by Paul B. Woodfin, Town Treasurer, for furnishing all material and erecting complete a steel stand pipe 25 ft. in diameter and 80 ft. high.

Milwaukee, Wis.—Steel Oil Tanks.—Until 10:30 a. m., June 24, by Board of Public Works, Charles J. Poetsch, Chairman, for furnishing four 6,000 gal. steel tanks to be used as reservoirs for asphaltum oil.

Excavation, Earth and Rock.

Bids are asked on following work, the notes being arranged alphabetically by states:

Danville, Ill.—Stripping.—At once, by Fraer Coal Co., Danville, N. Y., for stripping earth ground and shale of an average depth of 18 ft. Official advertisement will be found elsewhere in this issue.

Lometa, Tex.—Grading.—At once, by Morey-Faulhaber Co., for the grading of several miles on the Santa Fe, in Lampasas County. Official advertisement will be found elsewhere in this issue. Noted under Confirmed Reports.

Materials, Machines, Supplies, Etc.

Bids are asked on following work, the notes being arranged alphabetically by states:

Washington, D. C.—Steel Bars and Rings, Etc.—Until July 18, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for furnishing deformed steel bars, manganese steel rings for rock crusher screen, pneumatic hoist, gasoline motor and spud timbers.

Washington, D. C.—Water Meters.—Until 2 p. m., June 27, by District Commissioners, for furnishing water meters for the district of Columbia.

Atlanta, Ga.—Sewer and Water Pipe.—Until 10 a. m., July 12, by R. V. LaDow, Supt. of Prisons, Washington, D. C., for furnishing and delivering at United States Penitentiary, Atlanta, Ga., water pipe, fittings, sewer pipe, etc.

Atlanta, Ga.—Steel Bars.—Until 10 a. m., July 8, by R. V. LaDow, Supt. Prisons, Washington, D. C., for furnishing and delivering at Atlanta, Ga., steel bars for window gratings in the sun, dispensary and operating rooms of the hospital building at the United States Penitentiary.

Chicago, Ill.—Roofing Gravel.—Until 11 a. m., June 25, by Department of Public Works, B. J. Mullaney, Commissioner, for furnishing 2,500 cu. yds. of roofing gravel for top dressing of granite pavements.

Jeffersonville, Ind.—Quartermaster's Supplies.—Until 10 a. m., June 24, by Depot Quartermaster, for furnishing necessary quartermaster's supplies.

Plainview, Minn.—Cast Iron Pipe, Etc.—Until July 1, by Village Recorder, for furnishing the following: 3,450 ft. 4-in. cast iron water pipe; 2 ft. 4-in. cast iron elbows; 4 ft. 4-in. cast iron elbows; 4 ft. 4-in. by 7 ft. frost proof case 2-2½ hose nozzles fire hydrants; 1 ft. 4-in. B gate valve, hub ends; 200 lbs. jute; 1,750 lbs. pig lead.

St. Louis, Mo.—Cement, Boiler, Etc.—Until June 23, by Capt. William H. Wilson, Depot Quartermaster, for furnishing supplies, including acid, asbestos, asphaltum, balls, bars, bends, bibbs, bits, blades, books, bowls, lavatory, braces, brackets, cement, gas pipe, chain, clamps cleaners, clocks, cloth, cocks, collodion, compound, boiler, sheet and roll copper, crossovers, countersinks, couplings, ferrules, files, rubber gloves, graphite, hammers, heaters, irons, lamps, latches, leather, sewing machines, padlocks, paint, pipe, solder, staples, tees, traps, twine, valves, washers, wire, wrenches, etc.

Fort Slocum, N. Y.—Electrical Supplies and Building.—Until 10 a. m., June 25, by Capt.

Increasing the Efficiency of Labor.

We give space in another part of this issue to three valuable papers discussing methods of increasing the efficiency of labor. While none of these papers relates specifically to construction work, they all set forth general principles which are true of labor management everywhere. These papers are we believe full of suggestion to constructors. All construction work is confronted by a condition of high prices; with few exceptions all prices—wages, materials and supplies—are materially higher now than five years ago. In an early issue we shall have some facts to present on this question. Employers doing construction work are, however, confronted by more than the condition of high prices; it is commonly asserted that the efficiency of labor has decreased by almost as great a percentage as wages have increased. Obviously there exists in these conditions ample inducement to study methods of increasing labor efficiency.

Construction work, like the work of the field adheres steadily to the common wage system. This system furnishes small incentive to increased performance save as it comes from fear of discharge. Factory managers and shop superintendents have learned this fact widely and have substituted piece rates, profit-sharing and bonus systems of payment. A few constructors have done the same in a notable way and a few more have introduced bonus payments in special cases, but with the majority the common wage system and the "driving" foreman exist. There is a call to constructors for better labor management than this; the present conditions of increasing wages and decreasing efficiency loudly voices this call.

It does not do any longer to stamp the idea of payment in proportion to performance as a notion of the theorists. It is a vital, practical fact. Wherever it has been fairly tried in construction work it has demonstrated its value. The columns of this journal have recorded the proofs time and again. There is, moreover, reason behind the idea which can be understood by any constructor. It is the reason that makes him bend every effort upon his work, the expenditure of increased financial reward. The bonus system of payment is an incentive to the workman to do his best just as the expectation of greater profits is the incentive to the constructor in his larger sphere of action.

The three papers which we publish this week vary in character and in their immediate objects, but the great fact demonstrated by all of them is that a reward for efficiency must be held up if efficiency is to be secured. Coincident with this main fact is a second lesson, that accurate records of efficiency must be kept upon which to base the reward. It is a common excuse that such rewards cannot be devised for many kinds of construction work. They have been devised for factory work of very complicated character. We believe that they can be devised for practically every kind of construction work. This is not the thing that we wish to point out here, however, it is the fact that constructors must come to the task of studying more scientific methods of increasing labor efficiency than now prevail in most construction work.

Precautions in Interpreting Records of Test Borings.

Based on experience in making test borings for the Catskill Aqueduct, Mr. John P. Hogan gives* the following notes on interpreting and recording results:

All boring records, whether from wash, diamond drill, or shot drill holes, require the most intelligent interpretation based on extended experience for thorough understanding, provided anything more than a rock profile is desired. An inexperienced engineer can be very easily deceived by the operator, both as to character, materials encountered, and difficulty of work, and the apparent results are often deceiving in themselves.

In wash boring the tendency is always to indicate coarser material than is encountered, especially when powerful pumps are used. The finer material is dissolved and carried off and a much greater portion of the larger particles remain in the sample pail. Clay or silt shows a tendency to appear as sand, and sand to appear as gravel. This is especially true when sinking is slow and the material for feet around the bottom of the hole becomes washed out.

Remedies for this are the taking of dry samples in clay, mud, etc., and covering the discharge pipe with bagging to catch as much of the finer materials as possible. Samples are not altogether accurate as to point of taking, especially when steam pumps are used.

The percentages of core received from different holes are often used as a criterion of the relative conditions of the rocks, but there are in addition four important points to be observed, which greatly affect these percentages: (1) The type of machine and its condition; (2) The skill of the runner; (3) The skill of the diamond setter; (4) The dip of the rock.

(1) An old machine whose gears are worn or loose causes the drill rods to revolve in an orbit instead of around an axis and tends to chew up core. This is also the case when a machine is set up in a shaky position or when the core barrel or drill rods are crooked or worn.

(2) Generally speaking very hard rock should be drilled with slow revolutions and heavy pressure and soft rock with quick speed and light pressure. Reversal of these conditions usually results in grinding up the core. An inexperienced runner will drop core out of the core barrel. This necessitates grinding it up unless he can let the bit down over the top again.

(3) Different kinds of rock demand different clearances and different types of setting, which has considerable to do with the amounts of core recovered.

(4) If the bedding planes of a stratified rock lie at a pronounced angle to the vertical, the rock will core poorly. Thus a thin bedded stratified rock lying at an angle of 45° might be in an excellent position for tunneling but would show poor percentages of core. The same rock lying flat owing to its weak and thin beds would be very poor for tunneling but would give good cores.

It is important to be sure that the core barrel is straight and that the hole is started vertically. There are records of holes diverging 300 ft. in a depth of 900 ft. On the Rondout Pressure Tunnel most of the holes were drilled 20 ft. or more off line. Although great care was taken in starting these holes straight, three were encountered in the tunnel. The first diverged from the vertical 3.6 ft. in a depth of 470 ft.; the second 16.6 ft. in 440; and the third 53.6 ft. in 440.

The shot drill tends to magnify the difficulties of the ground explored as it is unable to proceed through even the smallest seam on account of loss of shot from under the bit until the seam is

The final interpretation of rock borings involves the determination of dips, strikes, and faults from the cores and the differentiation of the different strata and requires the greatest judgment and experience when the underground conditions are to be faithfully reproduced. It requires the careful consideration of trained geologists and should not be undertaken by the engineer unassisted. In the usual case, however, the advice of the geologist can be obtained only at intervals and the number and best location of holes to secure proper development is left largely to the engineer. Discussion of the process of development is beyond the scope of this article, but in the opinion of the writer the best results are obtained by locating holes so as to strike directly at critical points rather than to depend on narrowing down critical areas by a process of elimination.

The proper keeping of cores and records is the duty of the engineer and his inspectors. The rock cores should be preserved at least until the completion of the work for which the borings were undertaken and in such a manner that they can be readily identified. The following method has given satisfactory results in the preservation of over 15,000 ft. of core varying in diameter from ⅞ to 1⅞ ins. Each box 8 ft. long 1½ ft. wide and 3 ins. deep, contains a single layer. The core from a hole is laid continuously in rows from top of box to bottom, each row being separated by thin strips of boards. Elevations every ten feet are marked permanently on both core and box. Each piece of core removed for samples, test, etc., is replaced by a piece of wood of equal length. As soon as a box is filled a cover is placed on it and screwed down so that the core cannot be displaced but can be gotten at readily for inspection. On the top and end of each box the number of the hole and the elevations of core contained is painted.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Methods and Cost of Constructing Concrete Arch and Cast Iron Pipe Culverts by Day Labor, Illinois and Mississippi Canal.

The culverts were of two classes, concrete arches and cast iron pipe. The work described was done by day labor, but portions were also done by contract. The general run of wages on an 8-hour day basis, was:

Foreman, per month	$100.00
Engineers, per month	60.00
Carpenters, per day	2.50

TABLE I.—COST OF FOUNDATION FOR 10-FT. ARCH CULVERT NO. 6.

Item.	Unit.	Total.
10,794.9 cu. yds excavation	$ 0.25	$2,699
6,283.1 cu. yds. backfill	0.25	1,571
137 piles in work	4.00	548
12,934 ft. B. M. pine timber in work	28.00	362
7,189 ft. B. M. pine plank in work	20.00	144
1,197 ft. B. M. oak plank in work	40.00	48
1,620 lbs. spikes, bolts and nails	0.025	41
145.7 cu. yds. natural cement concrete	4.75	692
15.2 cu. yds. Portland cement concrete	7.50	114
477.4 sq. yds. slope paving	2.50	1,194
Sheeting pit	....	993
Total		$8,406

Laborers, per day	1.75
Water boys, per day	0.75
Teamsters with teams, per day	3.00

Arch Culverts.—The arch culverts were of two sizes, 10 ft. span and 12 ft. span, and both circular arches. The construction was substantially the same for both sizes; the following description relates specifically to the 10-ft. culvert.

TABLE II.—COST OF SUPERSTRUCTURE FOR 10-FT. ARCH CULVERT NO. 6.

Item.	Total.	Per cu. yd.
490 bbls. Portland cement delivered	$1,304.65	3.077
284.62 cu. yds. gravel delivered	535.57	1.263
Inspecting gravel	85.70	0.020
321.17 tons crushed stone	501.88	1.183
Hauling crushed stone	162.40	0.383
24.4 tons coal	31.62	0.074
Pumping	187.63	0.445
Lumber	218.53	0.514
Hauling lumber	112.60	0.265
Building and wrecking forms	489.64	1.155
Hardware	24.37	0.057
Mixing and placing concrete	555.61	1.310
Total for 423.7 cu. yds.	$4,210.20	$9.94

Barrels of cement used, 1.15.

The foundations were a concrete filled grillage 20x152 ft., containing about 134 oak piles, 18,000 ft. B. M. pine timbers, 1,500 lbs. spikes, bolts, etc., and 150 cu. yds. natural cement concrete. Three of the foundations were built with two grades; the upstream end for 25 ft. bring about 7 ft. higher than the balance of the foundation.

The body of the culvert was 3 ft. 9 ins. high, with an arch rising 2 ft. and 15 ins. thick at the crown. The radius of the intrados was 7 ft. 3 ins. and that of the extrados was 13 ft. The abutment was 5 ft. 3 ins. high and had a batter on the back of 1 ft. For some of the culverts a sort of tumble basin was provided about 25 ft. from the upper end in connection with the flashing device which was provided in some places in deep cuts. This flushing device consisted of a piece of concrete 15 ft. long and 16 ft. wide, extending from the foundation to 2 ft. above the water surface of the canal and having an opening in the front for a sluiceway from the canal and a well hole 5x10 ft. connecting with the culvert. At the lower end of the culvert there was a head wall 34 ft. long and 8 ft. high, with a coping 2½ ft. wide. At the upper end these was a U-shaped head wall, consisting of a retaining wall 3 ft. wide and 9 ft. high, extending across the foundation about 9 ft. from the upper end, and two L-shaped wings. A sill extends across the gap betwen the wings in line with outsides of the wings. A recess was left in each wing wall over the sill into which a timber is to be dropped to from the upper support of a temporary dam to be used when flushing the culvert.

TABLE III.—COST OF CONCRETE ARCH CULVERT 10 FT. SPAN.

Item.	Total.	Unit.
3,540 cu. yds. excavation	$1,081	$0.305
3,0.6 cu. yds. backfill	631	0.208
292 piles*	1,288	4.750
23,920 ft. B. M. grillage		46.670
2,877 lbs. drift bolts	1,102	0.030
1,920 ft. B. M. flooring		22.000
328 cu. yds. natural concrete	2,783	8.490
792.3 cu. yds. Portland concrete	7,378	9.31
140 sq. yds slope paving	681	4.87
Lowering culvert	1,085	
Engineering	1,193	

*Includes 96 ft. B. M. pine sheeting.

TABLE IV.—COST OF A 12-FT. CONCRETE ARCH CULVERT.

Item.	Total.	Unit.
3,072.3 cu. yds. excavation	$ 902	$0.294
1,995.9 cu. yds. backfill	326	0.163
185.9 cu. yds. natural concrete	1,287	6.920
442.32 cu. yds. Portland concrete	3,651	5.970
1,429 sq. yds. slope paving	480	3.360
13,841 ft. B. M. grillage and wales*	534	38.56
528 ft. B. M. sheeting	28	53.00
260 piles	1,233	4.74
Engineering and inspection	474	....

*Includes 1,749 lbs. spikes and bolts.

TABLE V.—COST OF 48-IN. CAST WIRE PIPE CULVERT WITH FLUSHING DEVICE.

Item.	Total.	Unit.
1,526.9 cu. yds. excavation	$ 298	$0.194
57.4 cu. yds. natural concrete	431	7.51
6.18 cu. yds. Portland concrete	56	9.06
41.1 cu. yds. masonry	361	8.78
79.9 sq. yds. slope paving	248	3.10
134 lin. ft. pipe laid	1,196	8.92
317.6 cu. yds. backfilling	34	0.107
480 cu. yds. backfilling	87	0.181

Referring to the day labor construction of the superstructure, the ground work of procedure was to build the side or abutment walls first and then the arch. For outside forms 3x6 in. x 8 ft. posts were erected on mud sills and braced to the sills with 4x4-in. timbers. The inside wall forms consisted of bents set 2 ft. apart each, carrying a segmental arch rib. The bents consisted each of two 4x4-in. posts set on the culvert floor and carrying a 4x4-in. cross-cap. The posts were braced to a 2x12-in. plank laid along the center of the floor by means of 2x4-in. braces. For the side wall lagging 2x12-in. planks were nailed to the posts; for the arch 2x4-in. lagging was used. These forms worked well except that the mud sills of the rear wall forms gave trouble by settling and after the first culvert, those sills were not used and the forms were braced to the runways.

TABLE VI.—COST OF A 48-IN. CAST WIRE PIPE CULVERT WITHOUT FLUSHING DEVICE.

Item.	Total.	Unit.
750 cu. yds. excavation	$ 187	$0.25
86 cu. yds. natural concrete	628	7.30
2.5 cu. yds. Portland concrete	22	8.80
29.4 cu. yds. masonry	257	8.75
48 sq. yds. slope paving	152	3.16
170 ft. pipe laid	1,514	8.89
1,020 cu. yds. backfilling	151	0.148

TABLE VII.—COST OF DOUBLE 48-IN. CAST IRON PIPE CULVERT.

Item.	Total.	Unit.
2,000 cu. yds. excavation	$ 790	$0.395
900.2 cu. yds. backfill	138	0.153
38.06 cu. yds. rubble masonry	394	10.35
66 sq. yds. slope paving	252	3.81
196 cu. yds. natural concrete	1,387	7.08
14.6 cu. yds. Portland concrete	112	7.64
292 ft. pipe laid	2,567	8.79
12.5 cu. yds. crushed stone	48	
Engineering and inspection	280	

All concrete was mixed in a Ransome Mixer and conveyed to the forms in wheelbarrows. At the first two culverts built a hopper was constructed at the charging end of the mixer into which a batch was shoveled from the pile in front. This method was not satisfactory, the average output for a force of about 28 men being only 45 cu. yds. in 8 hours. At the other culverts the mixer was set up at one of the piles of waste material from the excavation of the pit, a platform was built over it with a roadway leading to it from the material piles and the materials hauled to the mixer in dump carts, a charge at a time.

	2,405.91	$0.23	$5,498.82	(48")			
				1,831'7"	9.04	16,557.94	

The materials were measured in the dump carts, a false end gate being used to divide the two materials. The gravel or sand was shoveled into the front end of the cast so that the crushed rock would be dumped first. The casts were dumped through a hole in the platform into an extensive chute leading to the mixer. An extension was also put onto the discharge chute of the mixer and a platform covered with steel plate and large enough to hold a full batch was built in front of the chute to receive the discharge. Wheelbarrows were run partially under this platform and loaded by shoveling and pushing the

given in Table I. Table III shows the cost complete of another 10-ft. culvert and Table IV shows the cost of a 12-ft. culvert without flushing device.

Pipe Culverts.—The pipe culverts are single or double rows of 36 and 48-in. cast iron pipe with leaded joints. The pipes were placed 18 ins. below the canal bottom on a natural cement concrete footing 1 ft. thick and were buried half their height in concrete. Small rubble masonry headwalls were constructed at the ends. The sides of the approaches were paved with rubble and the bottom with concrete. Under each of the canal banks a ring of natural cement concrete 2 ft. wide was built, so that the water would not easily follow the pipe and cause a leak to develop.

The costs of several of these culverts built by day labor are shown by Tables V to X. Table V gives the cost of a 48-in. pipe culvert with flushing device and Table VI the cost of a 48-in. pipe culvert without flushing device. Table VII gives the cost of a double 48-in. pipe culvert without flushing device. Tables VIII, IX and X summarize the unit costs of 14 pipe culverts.

These tables of costs have been rearranged from data furnished by Mr. F. W. Honeus, U. S. Engineer office, Kansas City, Mo., under whose immediate direction the work was done.

Some Applications of Concrete and Cement to a Central Station System.*

The use of concrete and cement in connection with electrical structures has received considerable attention and its success as a new agent for this purpose is generally known. A description of some novel applications to various construction and repair work in a large central station system will illustrate its adaptability to the various requirements of such a system. The methods described are, with one exception, original with this company.

Reinforced Switchboard Structures.—A novel and economical method of construction was used in the building of a reinforced cement switchboard structure for the Esplen sub-station of this system. This switchboard is so located that it serves as a junction-point between the aerial and underground trunk cables to the various power houses and substations of the company. No switches excepting the hook-type disconnecting and paralleling switches are provided. In all cases, excepting in emergency, each cable continues through to its desired destination without any inter-connection with any other cable at this or any other sub-station, with the exception of one cable intended to supply the overhead lines which can be considered as feeders radiating from the station and carrying much smaller individual loads. These feeders, however, are each provided with oil circuit breakers.

The principal feature in which this cement switchboard structure varies from other concrete switch and bus-bar structures, lies in the fact that all of the structure excepting the base was plastered on metal lathing (expanded metal) instead of being poured, as is the common practice. The metal frame work consists of 3x3-in. angle irons running through the center of the board, one at each end and one located at each of the main sub-divisions between each three-phase panel, i. e., every third vertical compartment. The small channels are of 1-in. size. Over these is stretched the expanded metal, which is of about 1x⅜-in. mesh, and is tied with iron wire to the framework. A section of switchboard structure ready for plastering is shown in Fig. 1. The switchboard, as shown, is braced to the wall with 4-in. channels which, however, are used only during construction and are not necessary for the support of the board after erection.

This structure is 2 ft., 6 ins. in width, the central vertical web being 3 ins. thick; the barriers in the rear project 12 ins. and the barriers and shelves in the front 15 ins; the barriers between adjacent wires are 2 ins. thick and between each circuit of three wires, 3 ins. thick. The foundation, which was poured, was a 1-2-4 mixture. The entire structure is strengthened lengthwise by means of two 80-lb. T-rails. This stiffening was deemed advisable to permit of spanning a manhole and to guard against trouble from possible settling of an unstable earth foundation. A cement mixture consisting of 1 part Portland cement, 2 of sand, 50 per cent lime, with 1 bushel of hair to each barrel of lime, was first applied by a plasterers' trowel; the second and third applications being 1 part cement to 3 of sand, with no lime and no hair.

The greatest thickness of any web or barrier is 3 ins., and it was necessary to make only three applications of this composition to obtain the desired thickness in any plane. As a finishing coat, it was given a skim of about ⅛ to ¼ in. of Keene's cement, a hard white surface thus being obtained, which made a good body cement and resulted in a very pleasing appearance. The thickness of the Keene's cement was varied where necessary to correct any unevenness in the surface. Rough holes were left where the porcelain insulator supports were to be mounted; these were trimmed out and the insulators were then grouted in with cement.

A question naturally arises as to the relative merits of constructing a switchboard as against the usual method of pouring the concrete. This is a problem which varies with individual cases. As some of these 2-in. vertical barriers are 9 ft. long and 12 ins. wide, considerable trouble was anticipated, due to the tendency of the boards to warp or spring out of position. The work of construction was carried on without difficulty, however, and during over two years of service, the structures have shown themselves to be in every way as substantial and satisfactory as similar structures built by the method of pouring into forms.

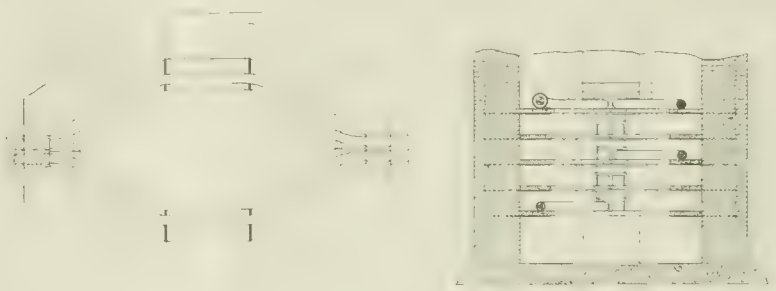

Fig. 2—Reinforced Cement Shelves in Manholes.

Where structures require heavier sections and where "knock-down" forms could be repeatedly used, it would probably be cheaper to pour than to build up by plastering; but, as a comparison, in this case, the builder's estimate of the cost of construction of the structure by the former method may be cited. For the lumber and labor for making the forms and putting them in position, exclusive of material, and cost of mixing, pouring and finishing, the estimated expense was alone two-

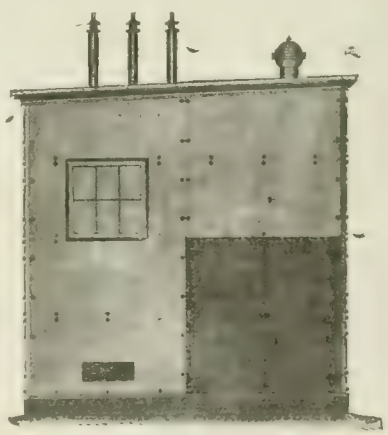

Fig. 3—Transformer Substation of Concrete Slabs.

*An article by H. N. Muller, Electrical Engineer, Allegheny County Light Co., in "The Electric Journal" for January, 1910.

thirds of the cost of this entire completed switchboard without the electrical apparatus. In this connection it might be interesting to state that it was found that the cost for slate at the quarry for use in place of concrete would likewise run about the same as the builder's estimate for making the wooden forms. An approximate estimate gives at least twice the cost for pouring this switchboard as compared with the expense of applying the cement with trowel. Erection of the iron work and stretching the expanded metal is a very simple operation, and, with the services of a plasterer and a man to mix the cement, the work is easily carried through with surprising speed and without the necessity of any previous experience.

The bus-bars and disconnecting switches are mounted upon porcelain insulator supports, which in turn are cemented into the switchboard; "rear connected" type switches are used where the conductors are to be carried through the barriers, an arrangement which is both simple and satisfactory.

Reinforced Cement Shelves in Manholes.—In an underground system where cables are carrying from 2,000 to 5,000 kilowatts, damage to such cables becomes a matter of serious consequence, and their protection from the mechanical injury, especially in manholes, is very important. For this purpose the Allegheny County Light Co. designated octagonal shaped manholes, receiving but two cables on the same horizontal plane, one turning to the right and one to the left, giving very gradual bends and resting throughout their length on reinforced cement shelves one inch thick. In the construction of these shelves expanded metal of one inch mesh is stretched in forms, into which the concrete is poured, a mixture of 1 part cement to 2 of sand being used. A plan and elevation of a cable manhole of this type is shown in Fig. 2.

The shelves are removable and are laid upon angle irons built into the manhole walls. These barriers protect the cables from being walked upon by careless workmen, or struck by ladders, falling tools, etc. They also are considered a protection above and below in case of severe short-circuit in adjacent conductors; moreover, the weight of the cables is quite uniformly distributed, which is a considerable advantage over the former method of supporting them from manhole cable-racks. These shelves cost about 10 to 12 cts. per sq. ft. They need only be manufactured and added as the multiplication of cables in the conduit line warrants.

Cement Cable Armor.—Where many cables are brought into one chamber and where insufficient clearance or bends and turns make the use of barriers impracticable, as well as the expense prohibitive, a very effective protection is obtained by the application of cement directly to the cables. A cement armor is applied by first winding ¼-in. sisal rope spirally around the cable ½ in. between centers and applying a rather dry mixture of 1 part cement to 2 parts sand. The whole adds about ⅜ in. to the radius of the cable. The cement is applied by hand with leather pad and brush. The cost runs from 1½ to 2 cts. per linear ft, depending upon the location and diameter of the cable.

This armor has been found to be of considerable protection to cables in cases where they might be accidentally struck by tools, etc., and serves also to prevent the cables from being bent and twisted by men not conversant with the proper handling of this material. It is also expected that this will prove a protection from burning in case of short-circuit on adjacent cables, as it has been found that a blow torch applied to a cable so armored stood about 4½ minutes before the lead armor began to melt; whereas, without the cement the lead melted in about one-fourth this time.

Cement is considered superior to asbestos for this work, not only because of its giving a more rigid protection against mechanical injury, but also because a short-circuit in the cable will usually manifest itself by bursting the cement, while with asbestos protection short circuits are often difficult to detect from any external appearances. Moreover, asbestos swells up when subjected to moisture and requires additional circumferential reinforcement to prevent its falling away.

Fireproof Enclosures.—It is often necessary to carry the 2,200 volt distributing circuits directly to such locations as lumber yards, basements of stores, public halls, residences and factories where accidental contact with the 2,200 volt circuit is possible, or where the danger from fire in case of blowing fuses, or short-circuits in transformers is to be guarded against. The Board of Fire Underwriters requires fireproof vaults where any oil-cooled transformers are used on the customer's premises. In order to meet these requirements and afford a protection against personal injury, this company has developed a standard form of enclosure for transformers with their switches, fuse blocks and other special apparatus used in such cases. Reinforced concrete slabs of standard size are used for these structures. These are made by pouring the concrete into forms, the inside dimensions of which are 6 ft. x 3 ft. x 2 ins. thick. Expanded metal of 1½-in. mesh is used for the reinforcement of the slabs, it being stretched in the forms before pouring. Cores are placed in proper position to provide for holes used in assembling, for ventilating ducts, switch, handle openings, etc. The slabs may thus be drawn from the forms ready for immediate assembling, except for cutting away the mesh from the various openings as required. The mesh is ordinarily allowed to remain in the ventilating openings.

In assembling the structure suitable angle iron, channel iron, etc., is employed to join the various concrete slabs, ordinary bolts being used. By this unit system a transformer enclosure of any size can be built the minimum of course being 3x3x6 ft. The foundations for these enclosures, when required, are formed by pouring the concrete, as this has been found to be the simplest and most satisfactory method of construction of this part of the structure. Iron doors are used for these structures, of such dimensions that, with their iron framework, they will replace one of the standard size slabs.

In this and similar cases where two circuits are furnished, one for the regular lighting and one for emergency, a double-throw switch is mounted within the enclosure with the switch handle projecting through one of the slabs. A diagram of connections with instructions to the local electrician, as well as the integrating wattmeter, is placed on the outside. The pilot lamp serves to light the outfit and all apparatus the same as if the apparatus were mounted on a switchboard panel.

An enclosure of this type installed outside of a factory building is made of standard slabs covered with weather-proof material. There are 13 slabs in all; the general dimensions are 6x9 ft. x 6 ft. high.

This fireproof vault is divided into two compartments, one 6x6 ft., in which the oil

Fig. 4 to 6—Methods of Repairing Timber Poles With Concrete.

Fig. 7—Example of Difficult Repairing of Wooden Pole with Concrete.

insulated transformer, the tank of the oil switch and the primary fuses are located; the second compartment, 3x6 ft., encloses what might be termed the front of the switchboard, containing the switch handle and the meters. The first compartment is locked and the key kept by the superintendent in charge of the district, while the low-tension compartment, containing the switch handle and meters is locked and the key kept by the electrician on the premises. This allows accessibility to the switches and the meter without danger of contact with the higher voltages.

This company has made about ten such installations in the last six months. The cement slabs are made on the premises of the company, which affords a rainy day job for the outside men. The cost of a standard sized slab is about $2.50; and the cost for the iron door, which is of practically the same dimension, is about twice this amount. These vaults are not only cheaper to install than one that would be poured on the premises, but they can be readily taken apart and moved to a new location or increased or decreased in size according to future requirements.

The extension of this idea, using standard sized slabs for the construction of a transformer substation is shown in Fig. 3. The framework of this proposed house is to consist of three-inch angle irons on the corners, and 5x3-in. T-irons for the center vertical supports and for carrying the roof slabs. The openings for ventilation below are obtained by placing a core in the forms, thus allowing the expanded metal reinforcement to show. The windows consist of wire-glass mounted in steel sashes with an angle iron framework. The eaves are finished off with a metal cornice, and the roof slabs are covered with tar and gravel and are laid with a pitch of one-half inch to the foot. The whole outfit is portable, except the foundation, which is poured. The particular value of such a house is that it is very flexible so far as dimensions are concerned and can be cheaply erected; and if future requirements warrant a more pretentious sub-station, this house can easily be taken apart and erected elsewhere in its entirety, or otherwise used in smaller units. The cost of such a building is practically the same as one of the same size constructed of corrugated iron. The life of corrugated iron is short; it is easily bent and perforated, and it requires frequent painting. The difficulty of painting without interruptions of the high potential circuits is one to be reckoned with. Cement also lends itself much more readily to mounting apparatus than corrugated iron.

Reinforcing poles.—The method or repairing poles suffering from butt rot, by means of concrete reinforcement offers many features of value to the maintenance department of railway, lighting and transmission companies, in fact, of all systems employing wooden poles, which are subject to decay. Fig. 4 shows the general method of doing this work, but which is modified to meet the requirements of individual cases, and upon which patents were granted to Mr. R. S. Orr, who developed this process. The rods are of Bessemer steel, ½ in. in diameter and vary in length from 4 to 6 ft. One end of the rod is bent at a right angle; this short leg is driven into the solid part of the pole above ground level, while the other end is driven into the remaining sound butt. A 1-2.5-5 mixture of concrete is then thrown in around the pole, allowed to settle into the cavities and is finished off with a richer mixture at the exposed end above the ground. This upper end of the cast is given form and finish by the use of an adjustable form.

Before this method of repair was applied to poles in service on the lines of the company, an investigation was made, to determine the effectiveness of this method of repair. Several poles which had been in service from 15 to 20 years and whose strength had become seriously impaired as the result of butt decay were carefully removed from service, reset and repaired by applying the foregoing method, using reinforcing rods and concrete. Tests were applied to prove their strength after being thus repaired. Figs. 5 and 6 represent two of these poles. The testing was done by applying a horizontal pull to the poles at a point about 27 ft. above ground level, and all of the following figures referring to the breaking tests are based on this height and direction of pull. Pole No. 1 (Fig. 4) broke under a strain of 750 lbs. at a point 20 ft. above ground, where it had been weakened by cutting a deep gain. The rope was then tied to the pole about 18 ft. above ground, the failure occuring under a pull equivalent to 1,100 lbs., applied at the standard height of 27 ft.; the break occurred at the top of the reinforced collar.

Pole No. 2, as shown in Fig. 6, was reinforced with a supplementary set of rods owing to the large cavity which extended both above and below the point of extreme decay. These rods were driven into the sound wood above the hollow part and above three feet from the ground. Under test this pole failed at a point 15 ft. above ground, the test load being 1,175 lbs.

In each of the preceding cases the poles broke above the concrete reinforcement, but pole No. 4 began to fail under a horizontal load of 1,000 lbs. at a point about four inches below ground level. The concrete broke, allowing the rods to be slowly pulled from the pole, with a gradually decreasing pressure to obtain further deflection. An interesting feature of this test was that the failure was gradual, and although the fault occurred in thise case at the point of reinforcement and the concrete collar was broken, the pole was still strong enough to support the weight of the linemen and required the combined weight of three men to pull it to the ground.

A notable application of this method of repair, in which its convenience as regards saving of both time and labor was an important feature, is illustrated in Fig. 7. This pole had become so impaired through butt rot that it could no longer be depended upon to carry its load. The ordinary procedure in such a case would have been to replace the pole by a new one, either in the same location or adjacent to it. In order to accomplish this the various wires, cables, and arc lamp mast arm supported by the old pole would have been transferred, and the cross-arms would have been taken off. Moreover, the final removal of the pole would be difficult when the wiring is so complicated as in this case.

This pole was not only repaired by reinforcement, but was also raised twelve inches in order to better meet the requirements at this point, the entire work being accomplished without exposing the linemen to the danger of coming in contact with any of the circuits, lighting lines and fixtures, telephone lines, or trolley span wire, all of which were dependent on this pole for support. By this method of repair a pole at least as substantial as the average to be found in service was obtained, with promise of no further attention being required for a long time.

The ordinary cost of replacing a defective pole by a new one, including the cost of the pole itself, haulage of the new pole to the point, labor of setting, transfer of wires and disposition of the old pole, has been shown by experience to be approximately $15. In extreme cases the cost may vary to even $50; for example, the cost of repair is increased where especially high poles are required or when the handling of main trunk lines near power stations is involved. This does not take into consideration loss of service and danger to linemen—items which cannot easily be estimated, but may be quite important.

The expense of repairing poles by reinforcement with rods and cement is in strong contrast to the preceding estimates. For ordinary repairs, such as have been illustrated, the cost averages $3.50 per pole; it being increased, however, in case of isolated repairs and where more elaborate reinforcement is required, either for purpose of obtaining additional strength or as a substitute for guy wires. The cost even in such cases does not equal the minimum cost of renewal.

The inference drawn from the tests and other data obtained regarding this method of reinforcing poles by means of rods and concrete is that it gives reinforcement sufficiently strong to enable the pole to withstand a horizontal strain of not less than 1,000 lbs. applied 27 ft. above ground, and that it is but a question of increasing the number of rods and the amount of concrete to meet any required strength. However, the results which have been outlined in the foregoing are considered to fully meet the requirements of a practical reinforcement, giving a good factor of safety for all ordinary pole line construction, at a minimum cost and without the necessity of giving any attention to the overhead wires during the process of making the repairs.

Additional weight is given to these facts when it is considered that the deterioration of wooden poles is due principally to butt rot. Hence, a pole which has been in service until its strength is perhaps 50 per cent of its original value, is not only restored to practically its original strength by application of this method of reinforcement, but by elimination of the possibility of rapid decay, its deterioration is much more gradual and its useful life is correspondingly increased.

Roadmasters and Maintenance of Way Association.—The twenty-eighth annual convention will be held at Chicago, September 13-16, 1910. Following are the subjects to be discussed and the committees of each:

"Proper Care of Track Material and Tools."—A. Hensen, chairman, C. & N. W., Green Bay, Wis.; J. W. McManama, B. & M., Waltham, Mass.; James Sweeney, C. & E. I., Danville, Ill.; M. Lumm, Wabash, Montpelier, Ohio; C. H. Cornell, C. & N. W., Antigo, Wis.

"Cattle Guards."—C. J. Muschott, chairman, Benton Harbor, Mich.; M. McFadden, C. & N. W., Marinette, Wis.; James Ryan, Jr., C. & E. I., Villa Grove, Ill.; M. H. Connolly, C. N., Van Wert, Ohio; B. F. Brown, B. & M., Lydonville, Vt.; Charles Newberg, C. & N. W., Eagle Grove, Iowa.

"New and Improved Appliances Including Ties."—L. Lawler, chairman, Southern Pacific, Lafayette, Ind.; L. C. Ryan, C. & N. W., Baraboo, Wis.; E. P. Safford, L. S. & M. S., Adrian, Mich.; B. A. West, A., T. & S. F., Pueblo, Colo.; John Nugent, C., R. I. & P., Iowa City, Iowa; John Mulvoy, M. & O., Meridian, Miss.

"Standard Switch Targets."—J. M. Meade, chairman, A., T. & S. F., Topeka, Kan.; M. Hermans, C. & N. W., Green Bay, Wis.; W. H. Putcamp, U. P., Omaha, Neb.; J. G. Hutchison, C., R. I. & P., Herrington, Kan.; F. D. Harrigan, P. M., Saginaw, Mich.; A. Clough, N. Y. C. & H. R., Batavia, N. Y.

"Rail Fastenings Including Insulated Joints."—Thomas Thompson, chairman, A., T. & S. F., Joliet, Ill.; W. A. Brandt, C. & N. W., Clintonville, Wis.; John Heshion, Mo. Pac., Concordia, Kan.; Tilman Burket, Penn. R. R., Bedford, Pa.; M. Foley, B. & O., Myersdale, Pa.; C. E. Boone, B. & A., Houlton, Me.

"Tie Plates and Rail Anchors."—L. C. Ryan, chairman, C. & N. W., Baraboo, Wis.; F. E. Sampson, B. & M., Concord, N. H.; J. O'Leary, C. & A., Joliet, Ill.; P. J. McAndrews, C. & N. W., Belle Plaine, Iowa; Warren Peachy, E. & T. H., Evansville, Ind.; John Boland, U. P., Lawrence, Kan.

Paper on "Treated Timber," by J. L. Single, Newark, N. J.

Paper on subject to be selected by himself by W. M. Camp, Chicago.

Topical questions for discussion: "Dressing of Gravel Ballasted Track," "Paving of Ditches," "Length and Size of Ties," "How to Drain the Midway of Double Track Whether by Surface Ditches or by Tile Drains," "Should the Gage on Curves be Readjusted to the Side of the Rail Head and by Moving which Rail," "Quality of Track Labor."

Committee of Arrangements: W. E. Emery, chairman, Peoria, Ill.; A. E. Hansen, C. & N., Green Bay, Wis.; W. M. Camp, Railway and Engineering Review, Chicago.

The Rockingham R. R. Co. has been chartered with a capital stock of $150,000, for the construction of a railroad from Roberdel, No. 1, Richmond county, North Carolina, to Gibson, Scotland county, via Rockingham, N. C., a distance of 24 miles. The incorporators include J. P. Leak, W. C. Leak and M. L. Hinsen.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Notes on the Influence of Tramways on Street Paving.*

The conditions imposed by the exigencies of modern civilization with regard to cheap, rapid, and convenient means of locomotion, from one part of a district to another, have introduced new problems for solution by borough and town engineers. The author has personally observed the effects of the introduction of tramways; he also, when acting as sole arbitrator, appointed by the government to settle certain matters involved in two important tramway schemes in or near the metropolis, had to digest voluminous evidence submitted by a number of expert witnesses on the question of the paving, etc., best suited to meet the requirements under various conditions, and in different localities. At these arbitrations, many points of interest were dealt with, some of which will be referred to in the following notes, in the hope that they may be conducive to an interesting and useful discussion.

It will be unnecessary to describe the electrical details of a tramway construction, as they are foreign to the object of this paper. It will therefore suffice if the more salient points of tramway and pavement construction of import to road engineers are discussed.

Up to March 31, 1908, there were 2,286 miles of tramways and "light railways" in this country opened for traffic and worked by electrical power, 52½ miles by steam, 27½ miles by cable, 4¾ miles by gas motors, and 94 miles by horses, making a total of 2,464¼ miles, of which 177 undertakings, measuring 1,619¾ miles, were owned by local authorities, and 128 undertakings, with a total length of 824½ miles, by public companies. The capital invested in these tramways amounted to £68,199,918. It will be observed by the foregoing statistics that tramways contribute a valuable and potent factor in matters of public convenience, and must also have an important influence on the question of street paving and works in general.

Foundations.—Tramway foundations, including a width of about 1 ft. 6 in. on the outside of the rails, are generally constructed of Portland cement concrete; the tram rails are usually blocked up to the required levels, and concrete is deposited in the trench, and brought up to the level suitable to accommodate the paving material; but on portions of the Kidderminster, Poole, Kinver, Aberdeen and other tramways, cross sleepers have been used, laid at 3 ft. to 3 ft. 6 in. centers; in some places these are embedded in concrete and in others in ordinary ballast. Where the subsoil is clay, or where it is liable to be wet and treacherous, it is a question whether rough stone drains to intercept the subsoil water, or, as in the case of the Middlesex County Council tramway, a blanketing of cinders and clinkers laid on the subsoil under the concrete are best suited for this purpose. The author is informed that the latter method has proved to be satisfactory.

Some of the Hull tram rails are laid on 4-in. by 7-in. creosoted wood stringers, and anchored through to the under side of the concrete, at intervals of 3 ft. 6 in. Mr. A. E. White, M. Inst. C. E., the city engineer, has supplied the author with a statement showing the average cost of such a permanent way, which was as follows:

*From a paper by R. O. Wynne Roberts, read at the Metropolitan District Meeting of the Incorporated Association of Municipal and County Engineers held May 24 at Caxton Hall, Westminster, England.

Rails, Etc., Per Ten Yards Single Track.

Concrete and paving exclusive of wood block 2¾ super. yds. at 8s. 8d.	1	3	10
Hardwood block 2¾ sq. yd. at 8s. 1d.	1	2	2.75
Cost of single track per yard	3	6	5.05

1,760 × £3 6s. 5. = cost per mile £5,844 13s. 4d.

There is about 6 in. additional concrete under the track as compared with ordinary paving, and the paving work on the tramway area is assumed to have cost 2s per super. yard more than similar work in the wings.

Mr. White also states that on the outer part of one of the routes sufficient land was purchased to enable a strip to be separated from the rest of the road by an avenue of trees, and reserved for tramways down its center; on the length the rails have been laid on cross sleepers and the road leveled with ballast and gravel. The cost of this length was only about £1 10s per lineal yard single track. The running is stated to be particularly smooth.

In the case of the Kinver 3 ft. 6 in. light railway, which is virtually an electric tramway running from Stourbridge to Kinver—4½ miles in length, with connection to the center of Birmingham—the 87-lb. grooved girder rails are, in the urban district, laid on 6-in. concrete foundations; but on the rural roads the 56-lb. vignole rails are laid on 7-ft. by 9-in. by 4½-in. red fir sleepers, supported and packed with broken stone ballast, on the waste land along the roadside; a portion of this line is also laid across fields. The maintenance of the sleeper track is stated to be low, working out at about £15 per mile per annum.

The foundations for sett or wood block pavements are usually 6 in. thick; where the subsoil is unstable, or the loads usually hauled on the streets are heavy, the thickness of concrete is increased. Six-inch bed of concrete is usually ample for most streets. The depth of concrete under the rails, and at times under the whole width of the track, is about 9 in.

When paving, tramway, or other works are carried on in busy thoroughfares, it is to the interest of the engineer that the public inconvenience should be as small as possible. When there is a considerable quantity of concrete work to be done, the employment of a small portable concrete mixer would, doubtless, be advantageous. Many mixers, however, are too cumbersome to be included in the portable class. A small and compact mixer, which has come under the author's notice, is so designed that the aggregates and matrix can be mechanically measured and mixed so as to conform with any specified proportions—the operations and cost of measuring are therefore unnecessary—one gang of men wheel up the materials into the hoppers and another gang of men remove the mixture as it is discharged at the outlet side. This machine is used on important government works in connection with reinforced concrete structures in the Metropolis, and as its weight is under one ton, its portability should make it useful on roadworks. The capacity of this mixer is about ten tons per hour, the concrete is made continuously, not in batches, and is uniform in quality. The energy required to operate this machine is less than one horsepower, as compared with a much greater power necessary for driving other mixers. The cost of mixing and laying by hand is about 2s 6d per cubic yard; by the ordinary mixer it is about 1s 4d, while with this machine it is reduced to about 8d. Incidentally it might be mentioned that the measuring device of this machine can be utilized in connection with the gauging of lime for water, sewage and other works.

Tram Rails.—Tramway rails have been standardized as to pattern, weight and quality, by the British Standards Committee, and these standards are recognized by most engineers. From the road engineers' point of view, rails 60 ft. long are more satisfactory than shorter ones, as the number of joints is less and the need for repairs is reduced, consequently minimizing the disturbance of street paving.

Joints.—The efficiency of the tram-rail joints, apart from its material influence on the life of the rail itself, and therefore on the cost of maintenance of the line, is a potent factor of tramway construction which tends more or less to minimize the necessity for disturbing the paving and thereby reducing the accompanying inconvenience to the general wheel traffic. A good mechanical joint must be as rigid as possible, and thus prevent deflection which causes the rail-ends to be burred by the hammering action of the tram-car wheels, inducing a pumping condition to take place and thereby admit water to the foundation, ultimately creating considerable trouble. A patent riveted fish-plated joint has, the author understands, given satisfaction on the Middlesex light railways.

The joint is claimed to cost less than the ordinary bolted fish-plate, and much less than the Thermit welded joint, while the cost of renewing is even more favorable.

There are of course other forms of joints, each with its advocates and special advantages, which the author leaves to the members to discuss and compare. The principal object which the road engineer has to advocate is the employment of the form of joint that obviates frequent attention to rail-ends.

A patent renewable plate made of special manganese steel has been used by many tramway authorities. The insertion of the renewable plate is made by cutting away the worn part of the head of the rail on the tramway track by a shaping machine, and afterwards truing up the surface by the same machine converted into a grinder. The joints can be seen at East Ham and elsewhere. The author has observed that they afford a smooth and durable running surface. The cost of inserting these plates is about £1 10s each joint.

Tie-Bars.—The tie-bars, which are necessary to maintain the rails in true gauge, when straight sometimes disturb the paving blocks by reason of the frequent vibration caused by tram-cars passing on the rails. It is usual to under-cut and side-splay the setts or blocks so as to accommodate the tie-bars. This, when wood blocks are used, tends to weaken the blocks, and, owing to the vibratory action referred to, together with side expansion of the timber, they are gradually worked up, causing the surface to be uneven. When cranked bars are used, this trouble is reduced, but straight ties are required in connection with the London County Council tramways. In this case the difficulty might be overcome by laying a paving block on each side of the bar, filling in the spaces between to the top of the bar with cement grout, and when this is set, inserting a 1-in. by 2-in. closure.

Position of Tram Lines.—In the case of single tracks, the tram lines are usually laid in the middle of the street, with passing-places at divers convenient points, and in the case of double tracks, they are located on the two sides of the crown at about 8 ft. or 9 ft. centers, taking up about 16 ft. to 18 ft. of the carriageway. This has an important effect on the remainder of the street, for

the ordinary traffic is, in proportion to the frequency of the tram-car service, prevented from using the best part of the carriageway, and also from passing from side to side. On the other hand, when the tram-cars pass at more or less prolonged intervals, the vehicular traffic tends to cling to the rails and cause tracking on the marginal pavements. The renewal of rails, repairs to pavements, and other operations appertinent to tramways are liable to obstruct the ordinary traffic to a large or small degree according to its density. The obstruction caused by tram-cars may, however, be considered as a momentary one, but the maintenance of public streets in a satisfactory condition is one of increasing difficulty.

The introduction of tramways in busy thoroughfares, together with the rapid growth of self-propelled vehicles plying about the public streets, calls for greatly increased width of streets and the provision of subways or bridges to enable pedestrians to cross with safety.

Paving.—The construction of tram lines tends in certain districts to depreciate the value of properties, especially along the routes, by inducing a deflection of certain traffic to new channels, and thus affecting the amenities of some neighborhoods, while, on the other hand, it undoubtedly assists in the development of suburban areas, and in enhancing the value of some properties by affording great facilities for convenient transport.

While the cost of maintaining the street paving outside the tram lines may be increased by the greater concentration of traffic thereon, it is largely compensated by the fact that the tramway authorities have to maintain the tracks, which saving to the road authorities must be an appreciable amount.

The question of paving materials to be employed depends on the gradients, the density of the vehicular traffic, and also on the character of the properties adjoining.

Setts.—In some towns, for instance, on important, high-class, busy thoroughfares, 5-in. by 4-in. close-jointed Norwegian setts are found to be satisfactory, affording a good foothold for horses, without causing as much noise as is common to stone pavements. Stone setts from the same quarry are often of different qualities, some are non-slippery and satisfactory, but others develop slippery surfaces, and consequently are only suitable for certain streets.

To secure a good sett pavement the setts should be gauged in dimensions, uniform in quality, evenly dressed, free from protuberances at the sides and tops, laid close, having a maximum joint of ⅜ in., evenly inlaid in regular, straight and bonded courses, on a thin layer of sand, pea gravel or crushed ballast, mixed with cement, which should be wetted as the work proceeds, well rammed, racked with ¼-in. to ⅜-in. gravel or crushed ballast to half depth and grouted. Some engineers stipulate laying Guernsey setts against the rail and, say, Aberdeen setts in the area between.

Wood Blocks.—In connection with wood block paving, the choice of timber appears to be largely a matter of individual choice between hard and soft timber. While the initial cost of laying soft wood block paving is less than that of hard wood, according to the experience of some engineers its durability is also greater. A comparison of the qualities and defects of these two classes of paving material is a matter of considerable importance, and an opinion might here be expressed that the wearing properties of wood or other classes of pavements if correlated on some accepted standard, such as, for instance, tonnage per unit width, to reduce the pavement, say, 1 in. in depth, would be useful. In this matter, it must be acknowledged that the Metropolitan engineers have unique opportunities.

The question of the necessary depth of block is, to some extent, also a matter of personal opinion, but hard wood blocks, 4 in. deep, have become more general, and in connection with tramway work a reduction in the depth of wood blocks necessitates increasing the embedment of the rails in concrete; while reducing the cost of the wood blocks this also stiffens the rails, making them more rigid and secure.

The practice of laying wood blocks on a thin cushion of sand and the insertion of thin strips between vertical joints is almost obsolete. The more approved and general plan is to lay them direct on the floated surface of the concrete with close vertical joints.

Grouting.—Grouting of sett paving differs in various towns, bituminous mixtures being employed by some engineers, and cement and sand grout of the consistency of thick cream by others. It is contended that setts grouted with cement can be raised, repaired, and reused with greater facility and at less cost than when pitch and tar solution is run into the joints. Bituminous grouting of wood blocks varies with the class of wood, creosoted timber, being less absorptive than hard wood, therefore requires a different solution. In some instances the joints are filled with the bituminous grout, while in others they are filled to one-half or two-thirds full, the upper portion is then filled in with cement and sand grout to restrain the softening action of the sun's rays. Bituminous grouting on hills, and in some cases on the level, has been found to gradually creep downwards and float under the setts or blocks, causing the pavement to ride and become uneven. This is probably due in a measure to the absence of effective adhesion to the blocks and to the relative viscosity of the solution being low, owing to an excessive proportion of diluents added to the pitch. A pavement, after many years' wear in the metropolis, was recently taken up and the bituminous grouting was found to be in excellent condition, without any creeping under the blocks having taken place.

Various tar compounds are being used for this purpose.

Wood paving on hills is usually considered as undesirable or inadvisable on gradients exceeding 1 in 20, but evidence was given that in some towns steeper inclinations have been wood paved without causing inconvenience. In Bristol, for instance, grades of 1 in 13.8 and 1 in 12.5 have been so paved.

Some engineers consider a granite sett against the rail with wood blocks adjoining to be an excellent arrangement, but others again deprecate such practice. The London County Council engineer has laid a hardwood block runner alongside the rail in Gray's Inn-road. When the track only is paved and the haunches or breast of the road are macadamized, it is found difficult to maintain a true surface between the two. A serrated or hit-and-miss toothing course tends to increase the difficulty, as it is impossible to properly consolidate the metal in the recesses.

Expansion Joint.—Expansion joints are always provided on each side of the road, but between the tram rails such joints are exceptional. The expansion between the rail and the slot in the L. C. C. tramway was shown to be sufficient to considerably reduce the slot opening. Bituminous mixture has been tried along the rail, but this was found to creep under the block, owing to the influence of the vibrations of the rail. At East Ham, Mr. A. H. Campbell, M. Inst. C. E., has made provision for expansion by gradually increasing the spaces between the blocks toward the center of the track, grouting the same with bitumen. This has been found to act efficiently, preventing the displacement of the rail and the fracture of the tie-bars, and obviating the disturbance of the paving.

Sectional Wood Blocks.—Reference might here be made to the sectional wood block, the principal advantage claimed for which is, that thorough seasoning of the thin scantlings out of which the small pieces forming the blocks are cut, and afterwards bound together by wooden underties or by steel strips inserted in side grooves, can be more effectually done (and in less time) than is possible with planks from which the ordinary blocks are cut. Shrinkage of solid wood blocks in dry weather tends to admit dirt into the joints, and this when rain falls or the streets are watered, allows moisture to sink into the body of the pavement, causing the timber to expand, and preventing the joints from effectually reclosing. Moreover, under the rolling concussive action of the traffic, the arises are consequently more liable to be rounded off. As sectional wood blocks are composed of several small pieces, the shrinkage is distributed, the openings are proportionately less, and the defects inherent to ordinary blocks are thereby reduced to a minimum.

Ordinary wood blocks are usually from 4 in. to 5 in. in depth; sectional blocks, however, are only 3 in. to 4 in. The attrite and concussive action of the traffic, together with the development of uneven surfaces, which are the result of the variable quality of solid wood blocks, often renders it necessary to relay the pavement, although the reduction in depth actually worn away is comparatively small; the adoption of more seasoned and better selected hard wood can be more effectually done with thin scantlings, and under these conditions sectional blocks from 3 in. to 4 in. deep may be considered as sufficient. Sectional blocks have been laid in various parts of London; a pattern, 3 in. by 3 in. by 8 in., was, for example, laid in 1906 between the curbstone and the tram line in Clerkenwell road, a road carrying heavy traffic. The writer recently had occasion to inspect this pavement and found it in excellent condition, and it appears to possess superior wearing qualities to the ordinary wood blocks which adjoined. The London County Council have also laid some of these blocks in Old street and City road. These are also in good condition, although the ordinary wood paving adjoining the latter has been frequently repaired.

Other sectional hard wood blocks have been laid along a stretch of the tram line in East Ham, which the author found had an even homogenous surface, exhibiting only slight indication of the joints.

The cost of this form of wood paving is higher than that of ordinary wood block, but the question of increased durability, and the maintenance of a true, even surface for a more prolonged period, may compensate for the additional initial expenditure.

A paved track with macadamized haunches, renders the latter expensive to maintain, and it is a question, when the annual cost of repairs amounts to about 1s per square yard, whether it would not be more economical and satisfactory to pave with some more permanent material. The presence of the track is a strong inducement for carts and wagons to be driven on the same, as the tractive effort required is necessarily much less than on macadam. The results of observation made by Mr. C. F. Wike, the city engineer of Sheffield, points to the fact that a granite track with macadam haunches, cost about 142 per cent per annum more than when the granite paving extended from gutter to gutter.

Life and Cost of Maintenance of Wood Block Pavement at Hampstead, England.

The Metropolitan Borough of Hampstead, England, has 62 miles of improved roads and streets. Of this total 42 miles are macadam and seven miles are wood paved. The remaining 13 miles are made up of three miles of flint roads, three miles of rag-stone roads, two miles of granite paved and smaller amounts of tar macadam, asphalt and basalt lava roads. In his report for the year ending March 31, 1909, Mr. Oliver E. Winter, Borough Engineer and Surveyor, gives considerable data on the construction and maintenance of these wood block pavements, and from this report we have taken the matter that follows:

The earliest use of wood blocks in the Borough of Hampstead for paving purposes appears to have occurred in the summer of 1883. At that time 234 sq. yds. of pavement was laid on West Hampstead News, at a cost of $1.76 per sq. yd., excluding the foundation work, which was done by the owners of the property. The pavement consisted of

6-in. deal blocks, grouted in lime and laid in a 6-in. concrete foundation. This strip was repaved in 1900 with 4-in. Jarrah blocks. The new pavement had close joints run with tar and grouted in Portland cement. The repaving cost $2.56 per sq. yd., which included two years' maintenance, and was done by contract. In the spring of 1885, a total of 11,714 sq. yds. of wood block pavement was laid on High Road, Kilburn, 6-in. deal blocks, grouted in lime being used. The foundation was Thames ballast and Portland cement concrete, 6 ins. thick. The work cost $2.32 per sq. yd. It was done by contract and carried a two-year term of free maintenance. In the spring of 1894, 11,665 sq. yds. of this street was repaved with 4-in. Jarrah blocks. The joints were run with tar and grouted in Portland cement. The greater portion of the courses were separated by wood fillets 3-16-in. thick; the remainder were close jointed. The repairing cost $3 per sq. yd., was done by contract and carried a two-year term of free maintenance. In the summer of 1902, 5,569 sq. yds. on this street were repaved with 4-in. Jarrah blocks. All of the courses were divided by fillets 1-10 in. thick. The joints were run with pitch and grouted with Portland cement. The blocks were laid on the existing foundation. The work was done by contract. It cost $2.62 per sq. yd. and had a two-year term of free maintenance. In the summer of 1903, 3,412 sq. yds. were repaved, the work being similar to that just noted. The cost, however, $2.58 per sq. yd. In the summer of 1905, still further work was done on the street, 2,237 sq. yds. being repaved with 4-in. sectional Jarrah blocks. The courses were divided by fillets 1-10 in. thick and the joints run with pitch. The blocks were laid on the existing foundation. The work was done by contract and cost $2.64 per sq. yd. and carried two-years free maintenance. Details of the cost of repairs on this street are given in the accompanying table.

A portion of Eton Ave. was paved in the autumn of 1887, plain deal blocks being used. A total of 2,106 sq. yds. was laid at a cost of $1.86 per sq. yd., exclusive of the foundation. In the summer of 1902, 455 sq. yds. of this was repaved on the existing foundation with 5-in. creosoted deal blocks, with close joints run with pitch and grouted with Portland cement. The work was done by contract at a cost of $2.04 per sq. yd., and carried a two-year maintenance term. In the summer of 1904, 1,112 sq. yds. were repaved with 4½-in. creosoted deal blocks on the existing foundation. The pavement, as before, had close joints run with pitch and grouted in Portland cement. The work was done by contract and cost $1.76 per sq. yd., this including a two-year free maintenance term. Details as to the cost of maintaining this pavement are given in the accompanying table:

In the summer of 1888 a portion of High Road, Kilburn, was paved with 6-in. deal blocks, grouted in Portland cement. The courses were divided by wood fillets 3-16 in. thick. The foundation consisted of Thames ballast and Portland cement concrete 6 ins. thick. The total yardage was 3,656, and the cost was $2.36 per sq. yd. The work was done by contract and carried a two-year guarantee. This portion of the street was repaved on the existing foundation in the summer of 1898, 4-in. Jarrah blocks being used. The pavement had close joints run with tar and grouted in Portland cement. The work was done by contract and cost $2.70 per sq. yd.

The accompanying table shows the cost of maintaining wood paved roads during the years ending March 31, 1904, 1905, 1906, 1907, 1908 and 1909. These are "main roads" and are consequently subjected to much traffic. Mr. Winter advises us that the cost of repairs to all the wood pavement laid in the year 1900 has been quite exceptional. This was due entirely to the defective manner in which the concrete foundation was constructed in that year.

The details of the various sections of the pavement listed in the table are as follows, all of the sections were maintained for two years by the contractor:

(1) Abbey Road.—4-in. Jarrah blocks. Courses divided by fillets 3-16 in. thick. Joints run with tar, grouted in Portland cement. Foundation, Portland cement and Thames ballast concrete 6 ins. thick; laid by Improved Wood Pavement Co.

(2) Abbey Road.—4-in. Jarrah blocks. Close joints run with tar and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement; laid by Improved Wood Pavement Co.

(3) Adelaide Road.—5-in. creosoted deal blocks; close joints run with pitch and grouted in Portland cement. Foundation, concrete 6 ins. thick (in places 9 ins. thick), made (after screening) of broken granite, Thames sand and Portland cement; laid by Improved Wood Pavement Co.

(4) Belsize Road.—Paved summer 1891. 5-in. deal blocks, grouted in Portland cement. Foundation, 6 ins. thick of Thames ballast and Portland cement concrete; laid by Improved Wood Pavement Co. Repaved in 1900-1 with 5-in. creosoted deal blocks. Close joints run with pitch and creosote oil; laid by Improved Wood Pavement Co.

(5) Belsize Road.—4-in. Jarrah blocks. Close joints run with tar and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement; laid by Improved Wood Pavement Co.

(6) Belsize Road.—4-in. Jarrah blocks; courses divided by fillets 1-10 in. thick; joints run with pitch and grouted in Portland cement. Foundation, concrete 6 ins. thick made (after screening) of the broken granite found on the ground, Thames sand and Portland cement; laid by Acme Wood Flooring Co.

(7) England's Lane.—4-in. Jarrah blocks; close joints run with tar and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement; laid by Improved Wood Pavement Co.

(8) England's Lane.—4-in. creosoted deal blocks; close joints run with pitch and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement; laid by Improved Wood Pavement Co.

(9) Eton Ave.—2,106 sq. yds. First paved in 1887 with plain deal blocks. In 1902, 455 sq. yds. repaved with 5-in. creosoted deal blocks; close joints run with pitch and grouted with Portland cement on existing foundation; William Griffiths, contractor. A total of 1,112 sq. yds. was repaved in 1904, with 4½-in. creosoted deal blocks; close joints run with pitch and grouted in Portland cement on existing foundation; laid by William Griffiths, Ltd.

(10) Finchley Road.—4½-in. creosoted deal blocks; close joints run with pitch and grouted in Portland cement. Laid by Acme Flooring and Paving Co. (1904) Ltd., on 9-in. concrete foundation, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement, by Council's Workmen.

(11) Finchley Road.—4½-in. creosoted deal blocks; close joints run with pitch and grouted in Portland cement. Foundation, concrete 9 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement. Improved Wood Pavement Co., contractors.

(12) Finchley Road.—4½-in. creosoted deal blocks; close joints run with pitch and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement. Foundation over a considerable area 9 ins. thick, at extra cost. Acme Flooring and Paving Co. (1904) Limited, contractors.

(13) Finchley Road.—5-in. creosoted deal blocks; close joints run with pitch and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames

TABLE SHOWING THE COST OF MAINTAINING "MAIN" WOOD PAVED ROADS IN THE BOROUGH OF HAMPSTEAD, ENGLAND

Name of Street	Kind of block	Area paved sq. yds.	When paved.	1st cost per sq. yd.	Cost of repairs in cents per square yards. 1903-4.	1904-5.	1905-6.	1906-7.	1907-8	1908-9.

[1]Renewal of expansion joint. [2]Original pavement laid in summer, 1891, at a cost of $2.58 per sq. yd; repaved 1900-1. [3]455 sq. yds. were repaved with 5-in. creosoted deal blocks in the summer of 1902 at a cost of $2.04 per sq. yd.; 1,112 sq. yds. were repaved in the summer of 1904, 4½-in. creosoted deal blocks being used, the cost being $1.76 per sq. yd. Repaving was done on existing foundation. [4]Not including foundation. [5]For creosoted deal; $3.40 for Jarrah. [6]3,256 sq. yds. were repaved in 1907. [7]2,707 sq. yds. repaved in 1906-7. [8]Excluding foundation. [9]5,106 sq. yds. repaved with 4-in. Jarrah blocks in summer of 1899 at a cost of $2.40 per sq. yd.; 5,101 sq. yds. repaved with 3¼-in. sectional Jarrah blocks in summer of 1908 at a cost of $3.24 per sq. yd. [10]Repaved with 4-in. Jarrah blocks in summer of 1898; repaved in summer of 1906 with 3-in. sectional Jarrah blocks. [10]11,665 sq. yds. repaved with 4-in. Jarrah blocks in spring of 1894; 5,565 sq. yds. repaved with 4-in. Jarrah blocks in summer of 1902; 3,412 sq. yds. repaved with 4-in. Jarrah blocks in summer of 1903; 2,237 sq. yds. repaved with 4-in. sectional Jarrah blocks in summer of 1905.

sand and Portland cement; laid by William Griffiths, Ltd.

(14) Finchley Road.—1,667 sq. yds. of 4-in. Jarrah blocks; courses divided by fillets 1-10 in. thick. Joints run with pitch and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement; laid by Acme Wood Flooring Co., 3,231 sq. yds. 5-in. creosoted deal blocks; close joints run with pitch and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement. Improved Wood Pavement Co., contractors.

(15) Finchley Road.—4-in. Jarrah blocks; courses divided by fillets 3-16 in. thick. Joints run with tar, grouted in Portland cement. Foundation, Portland cement and Thames ballast concrete 6 ins. thick; laid by Improved Wood Pavement Co.

(17) Haverstock Hill.—4-in. Jarrah blocks. Close joints run with pitch and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement; laid by Improved Wood Pavement Co.

(18) Haverstock Hill.—5-in. creosoted deal blocks. close joints run with pitch and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement. Improved Wood Pavement Co., contractors.

(19) Haverstock Hill.—4½-in. creosoted deal blocks. Close joints run with pitch and grouted in Portland cement. Foundation, concrete 6-in. thick, made (after screening of the broken granite found on the ground, Thames sand and Portland cement; laid by Improved Wood Pavement Co.

(20) Heath St.—5-in. deal blocks, pickled in creosote oil. Close joints, run with tar and grouted in Portland cement. Granite paving taken up and wood laid on same foundation; laid by Improved Wood Pavement Co.

(21) High Road.—In summer 1892, 4,995 sq. yds. paved with 5-in. deal blocks, grouted in Portland cement. Courses divided by wood fillets 3-16 in. thick. Foundation, Thames ballast and Portland cement concrete, 6 ins. thick. Improved Wood Pavement Co., contractors. At the same time 194 sq. yds. was paved with 5-in. Jarrah blocks. In summer of 1899, 5,106 sq. yds. was repaved with 4-in. Jarrah blocks. Courses divided by wood fillets, joints run with tar and grouted in Portland cement. Acme Wood Paving Co., contractors. In summer of 1908, 5,101 sq. yds. was repaved with 3¼-in. sectional Jarrah blocks. Courses divided by fillets 1-10 in. thick, joints run with pitch and grouted in Portland cement on existing foundation. Acme Flooring & Paving Co. (1904), Limited, contractors.

(22) High Roads.—3,656 sq. yds. paved in summer of 1888, with 6-in. deal blocks, grouted in Portland cement. Courses divided by wood fillets 3-16 in. thick. Foundation, Thames ballast and Portland cement concrete, 6 ins. thick; laid by Improved Wood Pavement Co. Repaved in summer of 1898 with 4-in. Jarrah blocks. Close joints run with tar and grouted in Portland cement on existing foundation. Improved Wood Pavement Co., contractors.

(23) High Road.—Described in first part of article.

(24) High St.—4½-in. creosoted deal blocks. Close joints run with pitch and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement; laid by Mowlem & Co.

(25) Mill Lane. — 4-in. Jarrah blocks. Courses divided by fillets 1-10 in. thick, joints run with pitch and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement. Acme Wood Flooring Co., contractors.

(26) Mill Lane. — 4-in. Jarrah blocks. Courses divided by fillets 1-10 in. thick, joints run with pitch and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement; laid by Acme Flooring & Paving Co. (1904), Ltd.

(27) Rosslyn Hill.—4-in. Jarrah blocks. Courses divided by fillets 1-10 in. thick, joints run with pitch and grouted in Portland cement. Foundation, concrete 6-in. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement. Acme Flooring & Paving Co. (1904), Ltd., contractors.

(28) West End Lane.—590 sq. yds. laid in autumn 1898, with 4-in. creosoted deal blocks. Total of 13,667 sq. yds. laid in autumn, 1900, with 4-in. Jarrah blocks. Close joints run with tar and grouted in Portland cement. Foundation, concrete 6 ins. thick, made (after screening) of the broken granite found on the ground, Thames sand and Portland cement; laid by Improved Wood Pavement Co.

Mechanical Road Haulage (Considered Commercially).*

The vital importance to Ireland of an improved, better organized, and cheaper system of internal goods traffic over comparatively short distances is perfectly well understood by all who have studied the subject. I wish I could think that it was fully realized by the public at large, or even by those whose immediate interests it concerns. Yet during my experience of the country, covering a period of over twenty years, several official inquiries have been held in the form of Royal or Viceregal Commissions, with the view of eliciting information as to the conditions of railway and canal traffic, and, it must be presumed, of providing remedies for the deficiencies this brought to light. A vast body of evidence has accumulated and has been buried away in blue books as the result of these investigations, and voluminous reports embodying recommendations that were valuable or otherwise have been submitted by the various Commissions. That has been, practically, the only result of all the great expenditure of time and money that these inquiries involved. Like many others, I was in high hopes that a great change for the better was coming when it was announced a few years ago, that Lord Pirrie and some other public spirited gentlemen of the highest standing contemplated the organization of a system of mechanical road haulage in certain selected districts where the want of means of transit is severely felt. The experiment, under such direction and control, could not fail to have most noteworthy consequences. What difficulties arose to prevent the carrying out of the scheme on the proposed lines I am not aware; sufficient to say, that it appears to have fallen through from one cause or another.

This is not an audience that needs to be reminded of the direct bearing which transit rates on produce exercise upon the producer. Without entering into the economic principles that rule the question, it is enough to observe that the all-important considerations for him are the cost of the raw material at his works (which includes the cost of transit thither), the cost of manufacture, the cost of carrying the products to market, and the market or selling value. In the case of the farmer you have the cost of seeds, implements, artificial manures, and so forth—what may be termed the raw material, the cost of transit to his farm, the cost of growing his crops and preparing them for market, the cost of transit to market, and the market value. How important the cost of transit becomes, since it enters not once but twice into consideration, is clearly obvious. It is not too much to say that, without economical transit, all efforts to promote the industrial development of the country, no matter how energetic and judicious, must be greviously hampered or entirely frustrated. This is especially true of manufactures in which heavy or bulky articles are handled, as in the case of flax mills, the various operations of the linen trade, woolen mills, flour mills, paper mills, wood products, agricultural produce, and so on. Country breweries with a local trade, already hard pressed by the competition of the great Dublin concerns, and of English and Scotch firms in the matter of ales, are another case in point. All this applies, too, to the quarrying industry, particularly as regards the profitable production of macadam, and the mining industry, which, after a long season of neglect, is again receiving attention.

My subject divides itself naturally into two parts. First, there is the case of road haulage over a short distance, say, fifteen or twenty miles, in competition with an existing railway service. Secondly, we have the problem of mechanical haulage from a railway station or shipping port through a district in which no railway, canal, or similar means of communication exists, and between points in that district. In the first case the railway terminal charges, the cost of loading and unloading trucks, varying from 3d. to 6d. per ton at either end, amounting in the whole to a prohibitive rate as regards many classes of traffic, render the alternative method far the cheaper. Moreover, delays in receipt and delivery are avoided, and you attain to the seeming paradox that the apparently slower mode of transit is, in actual fact, the speedier. In this connection I would call attention to what I consider a most untoward incident that lately came to my knowledge. The owner of a traction engine was summoned by County Council, before the magistrates sitting in petty sessions, for an alleged breach of the law relating to road locomotives. The chairman of this council was chairman of the local railway company with which the defendant was in competition.

The second section of the matter under notice, dealing with road haulage by mechanical means as supplementing the work of the railways, again sub-divides itself into two parts. The first has to do with the case where heavy loads are to be hauled, and where accordingly a heavy engine must be employed; the second applies to lighter loads, such as farm produce, like butter, milk, cream, eggs and fruit, or parcels of groceries, drapery and things of that kind are to be handled expeditiously. Here a lighter motor or tractor may be advantageously employed, and in certain circumstances, as in the absence of roads and bridges, that would be safe for the more powerful but heavier traction engine. As I shall show later on the lighter is also the more expensive of the two.

Since I have touched upon the subject of roads and bridges, I would like to add a few further words, though I may fairly be told that this is outside my province. We cannot, however, separate the road from the road locomotive, except in the happily unusual occurrence of the latter straying into the ditch or adjacent field.

I know perfectly well what is the great difficulty that confronts the engineer to the road authorities—a trouble to us all in every walk of life—the problem of providing money to adequately meet requirements. We all understand how hard it is to convince even the shrewdest men ordinarily once they become elected representatives of the community, and, therefore, burdened with a sense of responsibility that they should look far ahead of their own probable tenure of office. Their natural desire is to do what appears best in their own time, and it will look all the better if a reduction in the rates can be temporarily effected. Somebody else will in due course be called upon to take up the burden of the representatives' work. Any one of the good class of men whom I now speak about would, in the management of his own individual affairs, carefully consider the permanent effect and value of his expenditure upon improvements. Human nature being what it is, the tendency to adopt the principles that "Sufficient for the day is the evil thereof" must always influence the conduct of public business. Yet it should not be impossible to con-

* Paper by H. T. Harris, Dublin, read at Irish Road Congress, April 20-22, 1910.

vince men of intelligence that good roads are the cheapest in the long run and that money well laid out is, in the event, money saved. The well-made road is best for everybody—for the farmer who depends upon horse haulage, for the motorist, for the traction engine owner, for the community at large. All interests are here combined and merged in the greatest benefit of the greatest number. Public opinion must be educated upon the subject, but public opinion does not resist education; on the contrary, it welcomes enlightenment, and, therefore, I anticipate that this Congress will have beneficial consequences of far-reaching importance.

To start at the beginning, it must be always borne in mind that our roads were not designed and constructed to meet modern conditions of power haulage and mechanical traction generally. It is clear that these conditions will prevail more and more, and the inevitable inference is that the task of reconstruction must be faced and dealt with as thoroughly as the means at our disposal will allow. In several counties, as we know, this has been recognized, and the policy of those county engineers who boldly tackled the problem has been amply justified by results. It may seem invidious to particularize, but it is in no such spirit I would mention the admirable work that has been accomplished in wide districts so far separated as County Dublin, County Armagh, County Tipperary, parts of County Waterford—to name but a few. I should name Mr. Cowen, C. E., as the first to introduce steam-rolling of roads many years ago when County Surveyor of Down. He faced great difficulties and triumphed. The adoption of steam-rolling is now becoming general, and that involves good foundations for our roads, and the selection of the best procurable road metal for surfacing. It would be nothing short of an impertinence to tell engineers how important both matters are; but I would venture upon the reminder that the steam traction engine is—given proper conditions as to foundation and surface material—a steam-roller and a beneficent rather than a destructive agent in regard to the unkeep of the roadway. Certain obvious precautions on the part of the designers will at once suggest themselves to your minds. Wheels, for instance, should not be in alignment so as to cut ruts; they should be broad, especially where the country is low-lying and soft; they should be of good diameter so that the surface in contact with road-face should be large, thus securing a sure friction grip without tearing; in most cases I would add it will be found advisable to have them rounded off at the edges, so as to avoid cutting or breaking the skin of the road. Provision to this effect is contained in the English Heavy Motor Car Order, 1904.

At this point I will ask your leave to make a slight digression leading to a matter that may merit your attention. On a very moderate estimate we have in the country at least one thousand traction engines employed primarily for hauling and driving threshing machines. They are in demand during some of the autumn and winter months: to the owners of these engines the development of road locomotion means that capital invested on them becomes profit-earning throughout the year, instead of lying idle for comparatively long intervals. Such a consideration cannot be overlooked in a country where the agriculturist counts for so much. Again, a large proportion of these engines are readily convertible into road rollers. Some firms have adopted this economical method, when desired by customers, in regard to both light tractors and heavy road locomotives, and I shall be happy to give full and detailed information on the subject to any interested inquirer. My point, if I may put it in the briefest and simplest terms, is that roadmaking and road using can be thus worked in together.

I am quite conscious that I have only touched the fringe of my subject, but I cannot trespass further on your time beyond giving some figures that I have prepared as the result of my own experience and confirmed by inquiry from reliable sources. I have reason to expect, too, that where I have omitted details and possible matters of controversy that will come before you, other papers submitted will completely cover the ground:—

SHORT STATEMENT OF COMPARATIVE COST OF HAULAGE PER TON OF GOODS ON FAIRLY AVERAGE MACADAM ROADS.

A—Load out only; cost per ton mile:

	S.	D.
Heavy traction engine	0	1⅛
Medium traction engine	0	1⅜
Tractor and trailer wagon	0	2¾
5-ton steam motor wagon	0	2
5-ton petrol lorry (rubber tires)	0	2½
3-ton petrol lorry (rubber tires)	0	3

B—If loaded both ways:

Heavy traction engine	0	0¾
Medium traction engine	0	0¾
Tractor with trailer	0	1½
5-ton steam wagon	0	1½
5-ton petrol lorry (rubber tires)	0	1½
3-ton petrol lorry (iron tires)	0	1¾

Actual Cost of Steam Haulage, the amount of work done by each of three Locomotives and by Steam Lorry, a Compound Road Locomotive on Springs, with three speeds and awning weight, 14 tons, for 6 months, from October 29th, 1906, to April 27th, 1907, showing Estimated Expenditure for 128 working days:—

Prime cost, £208 2s 10d.

	£	S.	D.
Depreciation, at 10 per cent, on £708 2s 10d (6 months)	35	8	2
Interest on capital at 5 per cent, on £708 2s 10d (6 months)	17	14	1
Wages for driver and assistants	117	2	10
Fuel	24	17	0
Oil, water, etc.	2	13	0
Repairs (say at 5 per cent on outlay for 6 months)	17	14	1
License (proportion for 6 months)	9	0	0
Total	£224	9	2
Less amount earned by hire	42	1	1
Total	£182	8	1

Total working days, 128.
Total weight carried, 2,164 tons.
Work Done—17 tons × 15 miles × 128 days — 32,640 net ton miles.
Cost—£182 8s 1d; 32,640—1⅛d per ton mile.
Average cost per ton transported 15 miles, 1s 8¼d.

A Compound Road Locomotive on Springs, with three speeds and awning, for 6 months, from October 29th, 1906, to April 27th, 1907, showing Estimated Expenditure for 131 working days, 14 tons:—

Prime cost, £708 2s 10d.

	£	S.	D.
Depreciation at 10 per cent on £708 2s 10d (6 months)	34	8	2
Interest on capital at 5 per cent on £708 2s 10d (6 months)	17	4	1
Wages for driver and assistants	118	1	6
Fuel	24	17	0
Oil, Water, etc.	2	13	0
Repairs (say, at 5 per cent on outlay, 6 months)	17	14	1
License (proportion for 6 months)	9	0	0
Total	£224	17	10
Less amount earned by hire (stationary)	42	14	11
Total	£182	2	11

Total working days, 131.
Total weight carried, 2,252 tons.
Work done — 17 tons × 15 miles × 131 days — 33,405 net ton miles.
Cost, £182 2s 11d—33,405, 1⅛d per ton mile.
Average cost per ton transported 15 miles, 1s 7½d.

A Compound Road Locomotive on Springs, with three speeds and awning, for 6 months, from October 29th, 1906, to April 27th, 1907, showing Estimated Expenditure for 132 working days (weight 12½ tons):—

Prime cost, £688 8s 0d

	£	S.	D.
Depreciation at 10 per cent on £688 8s 0d (6 months)	34	8	5
Interest on capital at 5 per cent on £688 8s (6 months)	17	4	2
Wages for driver and assistants	113	16	10
Fuel	23	10	0
Oil, water, etc.	5	6	0
Repairs (say, at 5 per cent on outlay, 6 months)	17	4	2
License (proportion, 6 months)	7	0	0
Total	£218	9	7
Less amount earned by hire	42	11	0
Total	£175	18	7

Total working days, 132.
Total weight carried, 2,165 tons.
Work done — 16 tons × 15 miles × 132 days — 31,680 net ton miles.
Cost, £175 18s 7d; 31,680, 1⅛d per ton mile.
Average cost per ton transported 15 miles, 1s 7½d

Working of Steam Motor for 6 months, from October 1st, 1906, to March 30th, 1907, showing Estimated Expenditure for 104 Working Days; Weight, 4 tons 17 cwt.:—

Prime cost, £600.

	£	S.	D.
Depreciation at 15 per cent for 6 months	45	0	0
Interest on capital at 5 per cent for 6 months	15	0	0
Wages for driver and assistant	58	6	7
Coke	18	6	0
Oil, water, etc.	10	16	0
Repairs and adjustments	21	2	6
Total	£168	11	1
Less amount earned by hire	20	9	8
Total	£148	1	5

Total working days, 104.
Total weight carried, 1,170 tons.
Total outward journeys, 190.
Work done (per journey)—6 tons × 13 miles × 190 journeys = 14,820 net ton miles.
Cost, £148 1s 5d—14,820—2¾d per ton mile.
Average cost per ton transported 13 miles, 2s 6d.

ANNUAL APPROXIMATE WORKING COSTS OF 5-6 TONS, STEAM WAGON, 150 MILES PER WEEK.

	£	S.	D.
Cost, interest on £550 at 5 per cent per annum	27	10	0
Depreciation at 10 per cent per annum	55	0	0
Fuel, 50 tons of coke at 12s per ton	30	0	0
Driver at 35s per week	91	0	0
Loader (sometimes not necessary) at 20s	50	0	0
Repairs and adjustments	40	0	0
Lubricants	12	10	0
Insurance and sundries	17	0	0

A.—Work done, without trailer, loaded in both directions, 6 tons×30 miles×260 days equals 46,800 ton miles per annum. £323, 46,800=1s. 7d. per ton mile.

B.—With trailer, loaded in one direction, 10 tons×15 miles×260 days, equals 39,000 tons miles per annum. £323—39,000=2d. per ton mile.

C.—With trailer, loaded in both directions, 9 tons×30 miles×260 days, equals 70,200 ton miles per annum. £323—70,200=1.2d. per ton mile.

Approximate Cost of Working 5-ton Petrol Lorry on Rubber Tires. Conditions similar to steam wagon, but distance too great to be accomplished by a steam wagon in a day, viz., 40 miles out and 40 miles home, at a speed of 10 miles per hour.

Prime cost, excluding tires, £600.

	£	S.	D.
Interest on £600 at 5 per cent per annum	30	0	0
Depreciation at 15 per cent per annum	90	0	0
Repairs	40	0	0
Petrol, 20 miles at 5 miles per gallon, at 9d	150	0	0
Tires, £145 per set, a set lasting about 8 months	217	10	0
Driver at 35s per week, 50 weeks	87	10	0
Lubricants	10	0	0
Insurance	15	0	0
Total	£640	0	0

Work done—40 miles, with 5 tons by 250 days, equals 100,000 ton miles per year.

Equals 1.5d. per ton mile, or allowing for less wear and tear of tires, etc., and less patrol consumption, about 2.5d., if loaded one way only.

ANNUAL APPROXIMATE WORKING COST OF 3-TON PATROL LORRY.

Prime cost, with rubber tires, £655; without rubber tires, £550.

	£	S.	D.
Interest on capital of £550 at 5 per cent per annum	27	10	0
Working costs 57-70 cwt. petrol:			
Depreciation at 15 per cent per annum	82	10	0
Repairs	30	0	0
Petrol, 100 miles per day, 250 days per annum, at 7 miles per gallon, 9d per gallon	134	0	0
Tires, £105 per set, a set lasting about 8 months, at 12,000 miles per set	182	0	0
Driver, 35s per week, 50 weeks	87	10	0
Lubricants	8	10	0
Insurance, etc.	15	0	0
Total	£567	0	0

Work done—3 tons by 100 miles by 250 days—75,000 ton miles per annum.

Cost £567÷75,000=say, 1¾d. per ton mile, loaded both ways; or, if loaded one way only, 3d.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Typical Structural Details of Large Concrete Sewer Work at St. Louis, Mo., with Some Notes on the Specifications.

Some very heavy sewer work is being done in draining the Harlem Creek and Glaise Creek sewer districts in St. Louis. Trunk sewers of concrete and brick varying from 5 ft. diameter to 15x11 ft. in section and of various sectional forms are being built. Some of the general and several of the special structural details of these sewers are of interest and they are described here from information furnished by Mr. H. R. Fardwell, Commissioner of Sewers, St. Louis, Mo.

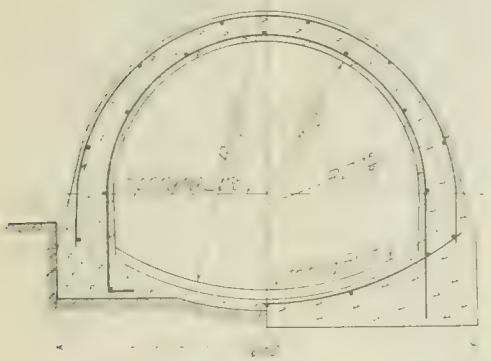

Fig 1—Section of Harlem Creek Sewers, St. Louis, Mo.

Concrete Horseshoe Sections.—The main trunk sewer in the Harlem Creek District has the concrete horseshoe section shown by Fig. 1, but varying in dimensions. In our issue of Feb. 20, 1907, and July 1, 1908, methods and costs were given of constructing some of the larger sections of this sewer. The section shown by Fig. 1, 4,793 ft. long and a similar section 10x8 ft. and 3,557 ft. long, are to be built this season. As shown by Fig. 1 the sections in rock and in earth vary slightly. The quantities per lineal foot are as follows:

Item.	Earth.	Rock.
Concrete in arch, cu. yds.	1.07	1.07
Concrete in walls, cu. yds.	0.35	0.35
Total above invert, cu. yds.	1.42	1.42

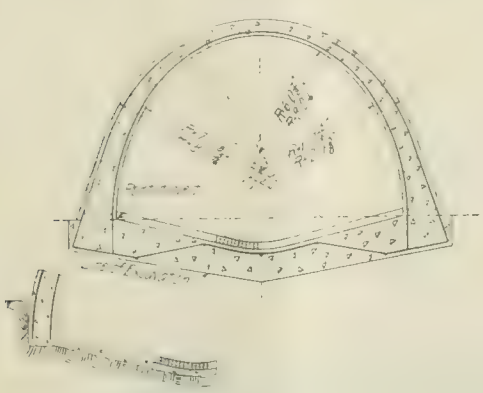

Fig. 2—Section of Glaise Creek Sewer, St. Louis, Mo.

Concrete below invert, cu. yds	0.50	1.20
Total concrete, cu. yds.	1.92	2.62
⅝-in. bars, lin. ft.	90.2	73.7
½-in. bars, lin. ft.	22.0	19.0
Vitrified brick, cu. yds.	0.17452	0.17452

The main trunk sewer in the Glaise Creek District has the section shown by Fig. 2, decreasing from the dimensions shown to a 11 ft. by 7 ft. 9⅝-in. size. The area of the section shown is 121 sq. ft., giving a capacity of 1,700 sec. ft. with an 0.0038 slope.

Figure 3 shows the manhole construction for concrete horseshoe sections. It will be noted that the manhole has a side entrance into the sewer and consists of a reinforced concrete base section carrying a brick shaft of the ordinary bottle form. The feature of interest is the arrangement of the reinforcement. The concrete spandrel wall supporting the vent pipe should also be noted.

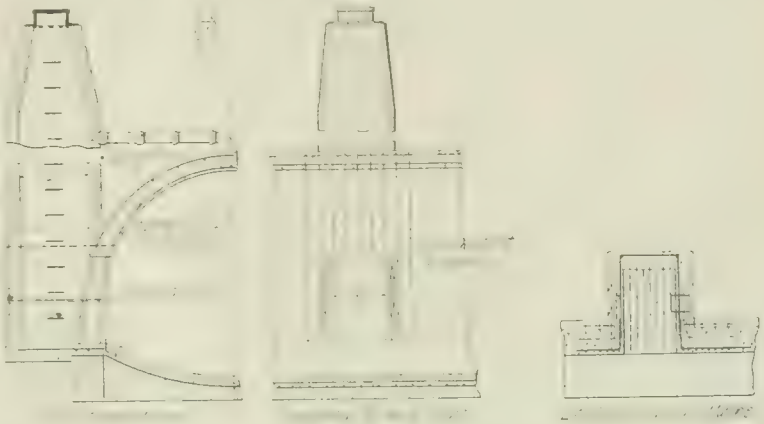

Fig. 3—Manhole Construction for Concrete Sewers, St. Louis, Mo.

In building these horseshoe sections provision is to be made for connections for lateral sewers as shown by Fig. 4. Where the laterals are not yet built the openings are to be walled up with brick work as shown.

Materials and Methods.—Excavation on this work is classified as follows: *A*. Ledges and well defined masses of rock and all detached pieces of rock and boulders of 1 cu. yd. volumn or more; *B*, all materials not coming within Class *A*. In trenching below the "point of invert" the excavation must conform to the lines of the "half-section in rock"; if overbreakage exists the voids are to be filled with Class *C* concrete. Above "the point of invert" the contractor may slope the sides of the trench to suit his convenience, but is to be paid only for the volume between vertical walls the outside dimensions of the sewer apart. Back-filling is intended to follow the sewer construction as fast as the concrete becomes hard.

Concrete is to "be made by mixing with broken stone or gravel an amount of mortar of the proper class which is 10 per cent in excess of the voids in the aggregate." For Class *B* concrete the mixture proportions will be 1 bbl. (380 lbs. net) of cement to 11.4 cu. ft. of sand; for Class *C* concrete the mixture proportions will be 1 bbl. cement to 15.2 cu. ft. of sand. These figures correspondent to proportions of 1:3 and 1:4, considering a barrel to contain 3.8 cu. ft. of cement. In measuring the sand for mortar, "it shall be shoveled damp into a suitable box and struck with a straight edge, without shaking or packing." The coarse aggregate is required to be graded as follows:

Diam. of ring, ins.	Amount Passing Rings. Not over.	Not less.
1½	100%	100%
1¼	70%	50%
⅝	40%	30%
¼	5%	

The proportioning of the concrete, as will be noted, involves as an essential a close determination of the voids in the coarse aggregate. The specifications require that:

After the broken stone or washed gravel has been graded to meet the above requirements, the voids will be calculated in the following

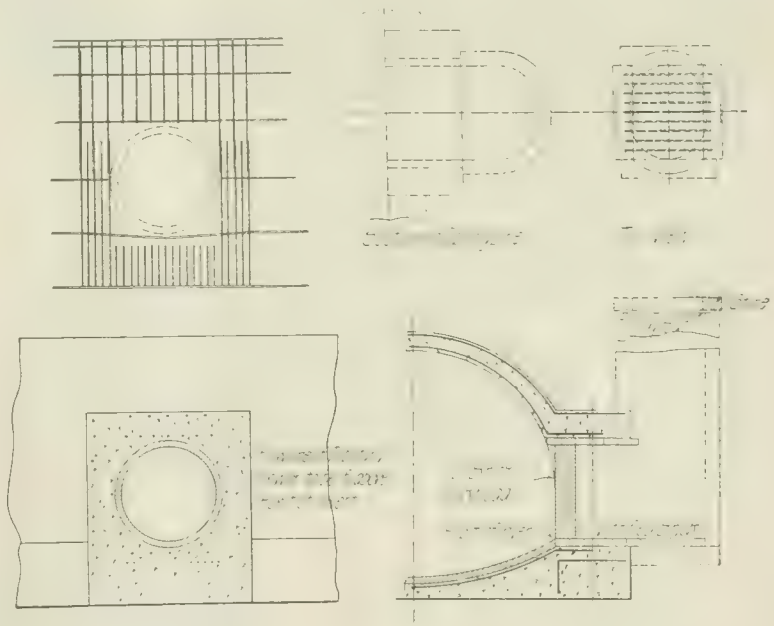

Fig. 4—Construction Providing for Lateral Sewer Connections, St. Louis, Mo.

manuner: The broken stone or washed gravel shall be shoveled loosely, without compacting, into a box of known capacity, and shall be struck with a straight edge level with the top of the box. The actual volume of the broken stone or gravel shall then be determined. The following expression represents the percentage of voids in the mass under consideration: Volume of box minus volume of broken stone or washed gravel divided by the volume of the box.

This clause misses telling the thing which is of vital importance, namely, how to determine the "actual volume of broken stone or washed gravel" in the box. It is probable that the common method of measuring water into the filled box is intended to be used, but confusion would have been prevented by so specifying.

The requirements for reinforcing steel call for high carbon steel having an ultimate strength of 85,000 lbs. and an elastic limit of from 50,000 to 60,000 lbs. per sq. in. The requirements for absence of rust are as follows: "Bars with slight rust that can be easily removed with the aid of a wire brush, may be used when rust is removed, but where rust scale is formed or beginning to form, they shall be rejected." Protection of the bars from rust by oiling or painting is properly prohibited. This amounts practically to requiring shipment of bars fresh from the mill for each day's work. The specified lap of bars at splices is: Lap in inches = (160 × area of bars in square inches) ÷ (diameter of bar in inches). Deformed bars are required.

Methods of Constructing 2,723 Ft. of the Northwestern Trunk Sewer, Louisville, Ky., with Some Costs.

One of the larger sewers now being constructed in Louisville, Ky., is the Northwestern sewer. Section B^2 of this work is being built under contract to Chas. F. Fitch & Co. of Louisville. The contractor here has worked out a system for handling this class of sewer work and in each phase of the work has used, what he believes, according to his experience, the proper and most economical method of handling that phase of the work. This contract is for 2,723 ft. of sewer through unimproved land. The sewer is of concrete, 12 ft. x 9 ft. for 1,126 ft. in length, and of three centered arch section. For the balance of the length it is horseshoe shaped, and about 9 ft. 3 ins. x 9 ft. in section. Kosmos and Speed Portland cements are used, and the reinforcement is Johnson corrugated bars.

The average depth of excavation was 22.4 ft. and the average number of cubic yards of excavation per lineal foot of trench was 12¼. The material excavated consisted of 6 ft. of blue and yellow clay below which was 6 to 12 ft. of yellow clay and loam and the balance, fine and coarse sand.

In opening the trench horse scrapers were used as shown by Fig. 1, and enough of the trench was excavated in this way, and used for filling in low land nearby, to take up the amount which would necessarily have to be spoiled. An average of half a dozen teams were used on this work with one team acting as a snap team. The longest haul was about 100 yards.

Plant.—The main plant for this contract consists of three ten-ton Browning locomotive cranes, two of which were equipped with automatic buckets. One orange-peel of 1 cu. yd. capacity and one clamshell of ½ cu. yd. capacity are used. The cranes run on standard gage track of 60 and 65-lb. rails. The track is laid along the trench for 600 ft. The mixer is a No. 2½ Smith. It is located on the opposite side of the trench from the cranes and is mounted on a section of portable track. Another section of track is placed handy for moving the machine along the trench by successive steps. The contractor maintains small blacksmith and carpenter shops on the work. On account of there being plenty of good sand in the trench, it is screened and used for the concrete. The screen used consists of a framework placed opposite to one of the cranes as shown by Fig. 2. This crane dumps part of the sand into the hopper at the top of the screen and the sand and rejections are carried by chutes to separate piles 15 or 20 ft. away from the trench.

The frame for the screens can be carried along the trench with the aid of one of the cranes. This arrangement saves quite a little money in producing a good sand on the job and in placing it along the trench in such quantities as are needed and at such a distance from the trench as not to be in the way of the mixer, and other work. The screen is the idea of the inspector of the work, Mr. Starkweather and was designed and built by him for the contractor.

Excavation and Backfill.—The cranes operate about as follows. Crane No. 1 is equipped with an Owens clamshell bucket and takes out the cut to a depth of about 10 or 12

Fig. 1—View Showing First Cut with Scrapers in Trenching for Northwestern Trunk Sewer, Louisville, Ky.

Fig. 2—View Showing Method of Trenching With Locomotive Cranes, Northwestern Sewer, Louisville, Ky.

ft. The sheeting is started as soon as practicable and crane No. 2 equipped with a ¾-cu. yd. bucket takes out the balance of the cut. The cranes dump all excavated material in a spoil bank except the sand, which is dumped on the screen by crane No. 2. Crane No. 3 brings up the rear of the work and does all the backfilling and pulling of timbers and sheeting.

Sheeting.—Hardwood sheeting 2 ins. thick and of various widths is used, and enough is kept on hand for sheeting about 250 ft. of trench. The bottom set of sheeting is required by contract in this case, to be left in

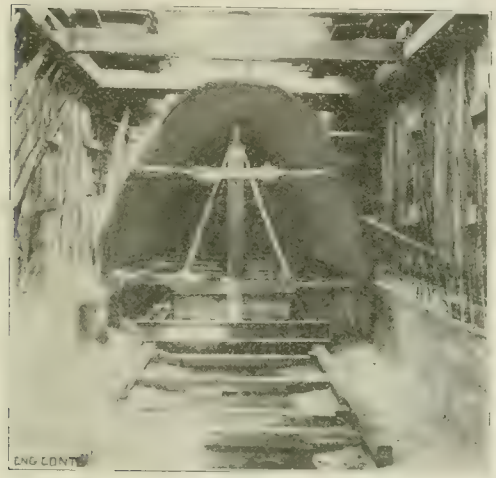

Fig. 3—View Showing Blaw Forms in Place and Carriage for Moving Them, Northwestern Sewer, Louisville, Ky.

place in the trench. The braces and waling timbers are of 8x8-in. pine; the tiers of cross braces are about 5 ft. apart vertically and the struts are usually 10 ft. apart.

Forms.—The sewer section is built in two operations, the invert and sidewall in one and the arch in another. The length of section handled at one time is 60 ft. and three sections are built in a week. The forms for the invert and sidewalls are of wood and are made of 1-in. material. Blaw arch forms are in use, and altogether 180 lin. ft. of forms are employed. The wooden forms are made in sections easily handled and are carried forward and set in place by laborers. The Blaw forms are shown by Fig. 3. They rest on carriages which run on tracks upon the completed invert. The carriages are provided with sets of screw jacks for bringing and holding the steel forms to the true radii as shown by Fig. 3. The forms are scoured with sand and oil before concrete is placed on them and the oily surface prevents adhesion of the concrete. The concrete material is brought to the mixer in wheelbarrows and the concrete is dumped directly from the mixer into galvanized iron chutes which convey it to place.

Figure 4 shows a typical junction chamber of the work in Louisville, and this chamber is a part of the work of this contract. The chamber is about 18 ft. long. The main sewer here is 9 ft. high by 12 ft. wide and the diameter of the branch is 7 ft. 6 ins. The chamber contains 39 cu. yds. of concrete.

The forms for the arch and invert were built of wood. The contractor was furnished by the engineers with sections of the chamber, drawn to scale, and representing a section every 2 ft. along the center line and at right angles to it. The ribs were sawed out to the dimensions shown by the drawings and put in place and braced. The 1-in. lagging was then laid on them, forming the arch center. The cost of the forms for this chamber, including the material in the forms, amounted to $4 per cu. yd. of concrete or $156 in all.

Progress and Costs.—Progress and costs of various parts of the work are interesting. The working day is 10 hours. Crane No. 1 operates a ½-cu. yd. Owens clamshell bucket and averages 400 buckets in 10 hours or 200 cu. yds. This bucket handles a full half yard at each operation. The labor cost on this machine is as follows:

1 engineer at	$3.50
1 fireman	2.00
1 tagman	1.75
1 signalman	1.75
Cost of labor for 200 cu. yds. (clay)	$9.00

Cost of labor per cu. yd., $0.045.

The second crane handles sand in a ¾-cu. yd. dump bucket filled by hand. It handles 300 buckets or 225 cu. yds. a day. The labor cost on this is as follows:

1 engineer	$3.50
1 fireman	2.00
1 foreman	2.00
8 men in bottom at $1.75	14.00
Cost of labor for 225 yds.	$21.50

This gives a cost of labor for 1 cu. yd. of $0.095. The third or backfill crane operates a 1-cu. yd. orange-peel bucket and handles 500 cu. yds. of material in 10 hours. The cost of labor backfilling is as follows:

1 engineer	$3.50
1 fireman	2.00
1 signalman	1.75
Labor cost backfilling, 500 cu. yds.	$7.25

Labor cost per cu. yd. of backfilling, $0.0145.

This crane when not backfilling, pulls timbers and sheeting. The average amount of coal used by one crane in a day is 1,200 lbs. Run-of-mine coal is used at $4 per ton. About 160 gals. of water are used per crane per day. The cranes each cost $5,000 new and their annual interest and depreciation is figured by the contractor at 30 per cent or 15 per cent for each item.

Moving and resetting 60 ft. of the large Blaw forms required the time of 6 men for 4 hours. The forms are rented for the length of time required to complete the work (8 months). There are 300 ft. of Blaw forms, 150 ft. of 9x12 ft. size and 150 ft. of 9x9 ft. size; and the rent on them is $1.25 per cu. yd. of concrete, or about $15 per lineal ft. of form. The freight on the forms is paid one way by the contractor. It is estimated by the contractor that he has saved 15 per cent by using the Blaw forms instead of wooden forms. On larger work on a 15-ft. sewer he estimates 20 per cent difference in favor of the Blaw forms, and on smaller sewers of 4 ft. diameter where Blaw forms were used for 1,000 ft. the saving was between 7 and 10 per cent.

The average wages paid upon this work and which fairly represent the wages paid on all the Louisville sewer work are as follows:

Superintendent, per month	$135.00
Street foreman, per month	80.00
Carpenter foreman, per month	80.00
Concrete foreman, per month	80.00
Timber foreman, per month	80.00
Team foreman, per month	80.00
Man in charge of all form work, per month	135.00
Timekeeper, per month	50.00
Water boy, per day	1.00
Stud men, per day	2.00
Carpenters, per day	2.50
Concrete men, per day	2.00
Timbermen, per day	2.00
Crane engineers, per day	3.50
Crane firemen, per day	2.00
Laborers, per day	1.75
Blacksmith, per week	20.00
Blacksmith's helper, per week	15.00
Teamsters, per day	2.00

Eight teams are kept at work steadily hauling material from the railroad. The haul is 1½ miles over good roads for the greater part of the distance. The cost of steel delivered on the work is $1.52 per 100 lbs. The cost of Ohio River gravel is $1.50 per cu. yd. delivered. The sand is taken from the trench and screened and costs about 50 cts. per cu. yd.

We are indebted for much of the above information, on costs and methods on this contract, to Mr. Chas. F. Fitch, General Contractor, Louisville, Ky.

The work is under the supervision of the Commissioners of Sewerage of Louisville, Ky., Mr. J. B. F. Breed, Chief Engineer, and Mr. Harrison P. Eddy, Consulting Engineer. Mr. Harrison P. Wires is Resident Engineer.

The Calumet-Sag Channel of the Chicago Drainage Canal Recommended as the Best Means of Sewage Disposal for the Calumet District.

The original Sanitary District of Chicago was confined approximately to the city limits of Chicago. In 1903 the District was extended to include Evanston, Ill., and other districts north of Chicago and on the south to include the so-called Calumet District. A channel known as the North Shore Channel is now being constructed and is virtually a branch of the Main Channel designed to take the sewage of the North Shore districts. On May 11, the Committee of Engineering of the Trustees of the Sanitary District submitted the following report on the question of disposing of the sewage of the Calumet District:

Your Committee on Engineering is of the opinion, that it is advisable at this time to state its position to the Board of Trustees of the District with reference to the question of affording relief to the Calumet District the sewage which flows into Lake Michigan through the Calumet River.

As early as 1904 the Board of Trustees passed ordinances establishing a route for a channel extending from its main drainage channel near the Sag, to connect with the Calumet River at a point east of Blue Island. In 1905 it was found that the channel as from the contamination of its water-supply by

Fig. 4—View of Junction Chamber on Northwestern Sewer, Louisville, Ky.

planned could not be sufficiently supplied with water unless it was extended to the improved portion of the Calumet River and your committee at once formulated a plan for its extension. But at the same time there arose vexatious engineering and legal problems, which have continued to the present time.

The most serious of these were (1) the recommendation of the International Waterways Commission (appointed to draft a treaty between the United States and Great Britain) to limit, forever, the amount of water which could be drawn from the southern end of Lake Michigan to 10,000 cu. ft. per sec.; (2) the reports of experts submitted by that commission that the sewage of the Calumet District could be disposed of in other ways than by water dilution, and (3) the refusal of the Secretary of War to permit the District to withdraw from Lake Michigan an additional 4,000 cu. ft. per sec. through the proposed Calumet-Sag Channel.

Then came the filing of a bill of complaint by the United States to enforce the decision of the Secretary of War by a perpetual injunction, which suit is a battle of hydrographic experts and is still waging in the Circuit Court of the United States for the Northern District of Illinois. Also an unsuccessful suit in the Supreme Court of the State of Illinois to declare the Sanitary District Act of 1903, extending the boundaries of the District, to be unconstitutional. And last, but not least, the recent refusal of the Secretary of War to permit any water to be withdrawn from Lake Michigan by way of the Calumet River, or in any manner to reverse its flow.

Your committee has not waited upon the determination of the suits referred to by the courts, but has steadily sought to find an efficient substitute for the method imposed on the District by law to dispose of the sewage of the entire district by water dilution, so that, if in the end the refusal of the Secretary of War to permit the flow of the Calumet River to be reversed was sustained by the courts, relief could be obtained in some other way.

The Board of Trustees has considered every phase of sewage disposal which has been brought to its attention. It has especially considered the broad questions of the advisability of constructing a sewage disposal plant, the effluent of which could be discharged into the lake or into the proposed channel, and of constructing a system of intercepting sewers and controlling works.

The Trustees had published in pamphlet form the exhaustive report of Messrs. Hering & Fuller to the International Waterways Commission on "The Disposal of Sewage of Chicago in the Calumet Region," dated Dec. 18, 1906; and procured and published a comprehensive report by Mr. Rudolph Hering to the President of the District on the "Sewage Disposal of the Calumet Region," dated Oct. 15, 1907; and a report by the Chief Engineer, Mr. George M. Wisner, dated June 9, 1909.

In addition to obtaining the reports of eminent experts on sanitation and hygiene, early in 1909 your Board authorized the construction of an experimental station at the 39th St. pumping works where the operation of the more rapid forms of sewage treatment by the use of settling tanks and sprinkling filters could be studied, under the conditions obtaining in Chicago. This plant was placed in charge of Assistant Engineer Langdon Pearse, with Dr. Arthur Lederer as Chemist and Bacteriologist. For more than a year there has been conducted a series of chemical and bacteriological analyses of sewage, and experiments to determine the safest way to dispose of the effluent from the settling tanks and the filter beds.

A full description of the experimental plant appears in an illustrated article in Engineering News of March 31, 1910, and was reprinted in pamphlet form by the District.

As time has passed, the population of the Calumet River District has largely increased and there has been a corresponding increase in the contamination of its water-supply, not only from the growth in population, but also by reason of the location in that district and in northern Indiana of many large manufacturing plants, which discharge into the Calumet River industrial waste, some of which is highly favorable to the growth of bacteria.

Your committee further reports that by reason of the refusal of the Secretary of War to grant a permit to take through the Sag Channel 2,000 of the 10,000 cu. ft. already permitted to be withdrawn from Lake Michigan, it has during the past few weeks again reviewed the entire subject of the contamination of the water-supply of the Calumet District, and presents herewith reports and communications relating thereto from its Consulting Engineer, Mr. Isham Randolph; its Chief Engineer, Mr. George M. Wisner; its Assistant Engineer, Mr. Langdon Pearse; its Chemist and Bacteriologist, Dr. Arthur Lederer; from Dr. William A. Evans, Health Commissioner of the City of Chicago, and from Mr. C. D. Hill, Engineer of the Board of Local Improvements of the City of Chicago, all of whom are experts of high standing in matters of sanitation, hygiene and the public health.

From the reports and communications mentioned, it is apparent that the present condition of the Calumet River and the extreme south end of Lake Michigan is simply intolerable and, unless rectified, will result very speedily in a serious epidemic of typhoid and other diarrheal diseases among the 500,000 people using water from the 68th St. intake. And, as the water mains of the entire city are inter-connected, occasions may arise when the water from that pumping station may flow beyond its normal territory and extend an epidemic.

The vital statistics of the industrial towns in Indiana at the foot of Lake Michigan, when compared with the vital statistics of the population in Chicago living under practically the same conditions as to food, climate and shelter, also demonstrate that the death rate from typhoid fever and other diarrheal diseases is practically 25 times as great as prevails in the city of Chicago. This abnormal condition can only be attributed to the fact that their water-supply is grossly contaminated by pathogenic germs, introduced by sewage.

It further appears from the report of your Chief Engineer that at the present time there are sewering into the Calumet River from the territory of the Sanitary District nearly 130,000 people and probably as many more living in the State of Indiana, and it is not only to remedy the conditions which now exists in that part of the Sanitary District which lies within the Calumet District, but to place the Sanitary District in a position where it can vigorously protest against the contamination of a common water-supply by the people of an adjoining state, that it is now necessary for the Board of Trustees to afford the people of that district such relief as it is able to do, in the face of the engineering and legal problems which have so long confronted and still do confront the Board.

Your committee is, however, of the opinion that the officials of the State of Indiana and its municipalities which border on Lake Michigan will at once co-operate with this District to prevent further contamination of the common water-supply if they are convinced that the Sanitary District is taking actual steps to abolish unsanitary conditions within its own boundaries.

Your committee, before coming to any conclusion, again considered the advisability of constructing a system of intercepting sewers and of the building of a filtration plant for the purification of the sewage of the Calumet District, but, as is well stated by Dr. W. A. Evans, in his letter of April 28, 1910, to the Chief Engineer of the District:

The state of the art of sewage purification by mechanical separation, bacterial action, oxidation and filtration probably has not advanced to the point where it would be safe to place the effluent in a quiet body of water so close to intakes used for drinking-water supplies.

In addition to this objection, the cost of adequate sewage purification on a large scale, as shown by the estimates of our engineers, is almost prohibitive.

There appears to be but one remedy available. The sewage of the District, whether subjected to purification processes or not, must be kept out of the Calumet River and Lake Michigan, and an outlet provided for its diversion.

Your committee is of the opinion that it is the duty of the Board of Trustees of this District to furnish such an outlet for the sewage of the Calumet District at once by acquiring the necessary right of way and proceeding to construct a channel to connect the Main Drainage Channel, at the Sag, with the Little Calumet River at a point just east of Blue Island; and that, until the question of the right of the District to take additional water from Lake Michigan through the proposed channel is fully determined, it will dilute the sewage which will necessarily flow into the channel by taking the normal flow of the Little Calumet River, amounting to about 720 cu. ft. per sec., and storm water drainage, which will result in preventing the scouring of the channel of the Calumet River lying in South Chicago into the lake for most of the time during the year.

Respectfully submitted,
WALLACE G. CLARK, Chairman.
EDWARD I. WILLIAMS.
Committee on Engineering.

Depreciation in Water-Works Accounts, With Reference to Uniform Reports.*

Some twenty years ago the writer was superintendent of a water works in one of the smaller cities of New England, and subsequently became treasurer, and was also manager of the gas plant in the same municipality. During his administration the water works were rebuilt, new pumps were installed, a water tower erected, a filter introduced, and the mains extended in many streets. At the same time a complete reorganization of the gas plant went on, with new works and holders. The process was changed from coal gas to water gas, and the mains throughout the town were repaired and relaid. This was the first practical experience with questions of depreciation on a considerable scale with which the writer had to do, for, as may be surmised, no allowances for depreciation had ever been made in the accounts of the water works or of the gas works prior to that time. All these renewals and reconstructions required the investment of new capital for the time being, although this was ultimately made up out of earnings in subsequent years.

From that time questions relating to depreciation in public service corporations and in municipal industries have played a prominent part in the writer's experience, as he has been engaged as an expert witness in a number of important suits relating to water works, gas plants, and electric light works in which the determination of fair rates for depreciation was fundamental. In each case, in fact, the result of the suit depended almost wholly upon a correct setting forth of these matters. The Holyoke Water Power case was one of these suits. Boston Consolidated Gas Co., Haverhill Gas Light Co., Norwich Gas & Electric Co., were others.

Having been called upon in a professional capacity to reorganize the accounts of various municipalities during the past ten years, the accounting of public water works and electric light works has been drawn forcibly to the writer's attention. Moreover, as chairman of a committee of the American Association of Public Accountants which has reported upon questions pertaining to uniform accounts in public service corporations and in municipal industries, the necessity for correct accounting of depreciation has been further impressed upon him. The reports of this committee may be found, by those interested, in the Proceedings of the American Association of Accountants for past years.

In connection with the Bureau of the Census, special attention has been given by the

*Extracts from a paper by Harvey S. Chase, Public Accountant, Boston, Mass., before the New England Water-Works Association, Feb. 9, 1910.

writer to water-works accounts, while in 1907 a report was submitted by him to the New England Telephone & Telegraph Co. which pertained especially to depreciation and kindred questions in the telephone field. These matters have been mentioned here in order to show how wide a field, in the experiences of public accountants as well as of water works, gas, and electric engineers, is covered by matters related to depreciation.

Mr. Albert H. Wehr, at the annual convention of the American Water Works Association last June, presented an admirable paper relating to uniformity in the accounts and reports of water works, in which he refers to the recent work of the United States Census Bureau and to the conclusions of Dr. Powers of the Census in the Bureau's bulletin, "Statistics of Cities," published early in 1909.

It may be advisable for me to summarize the statements of Mr. Wehr and Dr. Powers before proceeding to my own conclusions concerning the subject of this paper.

Mr. Wehr's considerations in favor of a uniform classification of accounts are as follows:

The evolving of any uniform classification of accounts for water supply or any other form of public service enterprise must be based on certain considerations of purely practical utility, of which the five following are the most important, viz.:

(1) To afford managers such detailed information relative to the operation of their properties as to enable the making of careful analyses of income and expense, both separately and as compared with previous similar periods.

(2) To afford accurate comparability of the operating results of such enterprises with those of any other similar enterprise.

(3) To so divide and subdivide the expenses as to easily enable the ascertainment of the separate and distinct elements of cost which make up the total cost of service. . . .

(4) To so devise the scope of the classification as to place the enterprise, whether privately or municipally owned and operated, on a basis which will disclose all income earned by the enterprise, whether actually received or not, and show the actual expense of operation or cost of service, whether actually paid or not.

(5) To so devise the classification as to divide the various branches or departments of such classification into certain fixed and clearly defined centers of division, from which all subdivisions radiate. . . .

In this connection, Mr. Wehr has devised a scheme of enumeration for the classified accounts which is simple, effective, and cleverly arranged. Mr. Wehr's paper sets forth definitions of the classifications, following in the main the terms accepted by the Census Bureau, and gives a complete scheme of the classified accounts under these heads:

1. Income Accounts.
2. Expense Accounts.
3. Allocation and Profit and Loss Accounts.
4. Outlay, or Property Accounts.
5. Asset Accounts.
6. Liability Accounts.
7. Proprietary Interests, or Proprietorship.

In this classification *depreciation* appears under various headings, the first of which is 214, "Expenses for General Depreciation," with subdivisions as follows:

2140. Undistributed Expenses for General Depreciation.
2141. Depreciation of Administrative Property.
2142. Depreciation of Accounting and Commercial Property.
2143. Depreciation of General Operating Property.

Also under the heading 224, "Expenses for Water Service Depreciation," appear the following subdivisions:

2240. Undistributed Expenses for Water Service Depreciation.
2241. Depreciation on Sources of Supply Property.
2242. Depreciation on Intakes and Aqueducts.
2243. Depreciation on Purification System.
2244. Depreciation on Pumping Station.
2245. Depreciation on Transmission and Distribution Storage System.
2246. Depreciation on Distribution System.
2247. Amortization of Preliminary Expenditures.

And under 23, "Miscellaneous Expenses," appear

23115. Depreciation on Tools and Appliances—Plumbing.
23125. Depreciation on Buildings, Tools, and Appliances—Shops.
23136. Depreciation on Buildings, Teams, and Equipment—Stables.
23144. Depreciation of Rental Property.
23155. Depreciation on Tools and Appliances—Meters.
23164. Depreciation of Forest Lands and Reservations.
23174. Depreciation of Other Accessory Enterprises.

Under 232, "Expenses of Invested Funds," there is an item 2322, "Expenses of Depreciation Funds"; also 325, "Depreciation in Invested Funds Values"; and 342, "Depreciation and Amortization Funds." Among the assets under the general heading 5 appears 563, "Depreciation and Amortization Funds."

No accounts appear among the liabilities under general heading 6, where we should expect to find "Depreciation Reserves." This fact particularly appeals to me, as it is the special point on which I must criticize the otherwise admirable and exhaustive classification of Mr. Wehr. No explanations of Mr. Wehr's views concerning depreciation reserves appear in the text of his paper, but in the Census Bulletin, on page 334, the term "depreciation" is defined as given below. In the Census classification, depreciation accounts appear under the following headings:

VII. Expenses for Water Service Depreciation.
208. On General Administrations Buildings and Equipment.
209. On Accounting Equipment.
210. On Operating Management Buildings and Equipment.
211. On Sources of Supply.
212. On Intakes and Aqueducts.
213. On Purification System.
214. On Pumping System.
215. On Transmission and Distribution Storage System.
216. On Distribution System.

There are also accounts for depreciation of pumping, rental property, meters, stables, etc., these being in accord with Mr. Wehr's classification. The Census definition of depreciation is as follows:

Depreciation.—Depreciation is a general designation of the gradual diminution in value which is caused by wear, decay, displacement, or obsolescence in the value of buildings and equipment, and of the sudden diminution which results from fire or other destructive forces. It is never actually or relatively the same for any two establishments, even of the same industry. For this reason it is impossible to frame concise, general rules for making allowances for depreciation which will not in their application be attended with a large margin of possible error. To use such rules without causing errors, those employing them must have for each individual establishment exact data based upon inspection, showing how far and in what respects its actual depreciation differs from that of the average establishment of its class. For this reason, a physical examination and appraisal of water works should be made every ten years, or even more frequently, in order to provide the basis for an approximate statement of the annual loss chargeable, as an expense, to depreciation. In the absence of such exact data for each water-supply system, however, it is to be assumed that depreciation takes place according to the average life of the several parts of such a system and of water-supply plants as a whole. The knowledge at the command of the Bureau of the Census leads to the conclusion that this average life is approximately as follows: For horses, carriages, automobiles, and laboratory fixtures and meters, ten years; office furniture and general equipment, fifteen years; boilers, steam pipes, and filtration equipment, twenty years; engines, pumping machinery, and wood pipes, twenty-five years; masonry of filtration plant, cribs, iron water pipes, intake pipes, fire hydrants, standpipes, and buildings, fifty years; reservoirs, tunnels, and aqueducts, one hundred years; and for the water system as a whole, fifty years.

There are many methods which may be employed in the computation of depreciation from data such as are above referred to, all of which involve the assumption that depreciation proceeds either with a uniform or with a geometrically accelerated rate throughout the life of the plant or fixture. The actual rate of depreciation unquestionably increases geometrically, and for this reason the best method of computing the amount of depreciation which has taken place during a series of years, or during a particular year, is that which is sometimes called the sinking fund or compound annuity method. The depreciation during the first year of any property having an expected life of fifty years is represented by a quantity equal to the annual payment which would have to be made each year during the fifty years, and invested at some specified rate of interest, to amount at the expiration of the fifty years to a sum equal to the original value of the property. The depreciation for any subsequent year would be the same quantity plus an amount equal to the interest on the prior payments and accumulated interest earnings at the specified rate. . . . By means of tables and diagrams, the depreciation for each particular portion of the water-supply system can be computed for any given year of its life, and thus the total depreciation for the system be ascertained, provided the enterprise has a detailed statement of its property and equipment as explained later under "tentative instructions for accounts, with cost and present value;" and, provided further, that the probable life of each division of the system has been ascertained by physical inspection, and that the rate of depreciation has also been determined in the same manner. The depreciation taking place in the water-service system in a given year, calculated as above, should be charged as an expense in primary accounts 208 to 216. This depreciation, however, is primarily an entry in the accounts with property and equipment, as shown in the accompanying summary of the cost and value of the water supply system and of its extensions, additions, and renewals. When detailed data are lacking for computing depreciation as outlined above, it may be assumed that the aggregate depreciation to be included in the accounts mentioned, or in subgeneral account VII, is 2 per cent of the present value of the water system. . . .

The Census classification for water works accounts does not set up a complete balance sheet of assets and liabilities, nor does it give a detailed list of liability accounts, in which should appear, according to the writer's opinion, a series of depreciation reserve accounts. It is owing to this omission, both in the Census classification and in Mr. Wehr's, that the present paper has been written, and the writer will, therefore, give a brief explanation of his reasons for urging the inclusion of depreciation reserves in all such classifications.

Much experience under the conditions in which public service corporations are acting in most municipalities convinces the writer that it is fundamentally necessary that questions of depreciation should be carefully considered, accurately worked out, and regularly entered upon the books of all such corporations. This being the case in private works, it is also necessary that municipally managed public services should have similar accounts. The reason in both cases is the same, viz., in order that *fair* rates may be established, that is, rates which will be just to the consumers and also fair to the plant. Such rates cannot be just unless full allowances shall have been made for deterioration of the plant, or, in other words, for the capital losses which arise from depreciation. Such losses must be provided from income, or otherwise they will require new capital. Therefore, they should be handled in the accounts as regular charges against income. This is most forcibly true in all plants which have to do with electricity, for in such plants depreciation during past years has been rapid, and changes in the art have frequently demanded that machinery should be scraped even though the machines themselves might be in excellent physical condition. Electric street railway companies, electric lighting companies, and telephone companies are fast coming to see the necessity for proper and complete provisions for depreciation. Gas companies are next in importance in this particular, while water works may be considered last. It must be noted that it is frequently the fact that "appreciation" in the general value of any water works, due to increase of population in its territory, may offset in great part, and sometimes may even exceed, the

losses by depreciation which occur during a given period. Therefore, while the emphasis which is here laid on depreciation accounting is accepted in full by electrical concerns today, and accepted in part by gas companies, it is nevertheless true that water works have not as a rule acknowledged the necessity for such accounting, or, at least, have not adopted such accounts in their bookkeeping systems. The same arguments which have compelled the use of depreciation accounts in electrical concerns will, in my opinion, compel their use ultimately in water works. This will come about mainly through the instrumentality of state supervising boards, which will require uniform reports from all municipalities and from their departments, in which a water department is frequently included.

Just as the Gas Commissioners of Massachusetts have required definite allowances for depreciation in the accounting of municipally operated plants, so, in due time, similar requirements will be promulgated for municipal water works.

If the writer has stated the facts correctly, and if his deductions in regard to the future are true, it is evident that proper accounting for depreciation should be undertaken promply in all such plants. The best way to handle these matters, in the writer's opinion, is by a series of *depreciation reserve* accounts, that is, by reserve accounts which correspond to the different classes of assets, and which appear in the balance sheet as liabilities (credit balances). Every monthly closing should provide for items to be charged to *expense* and at the same time credited to these various reserve accounts. Each of these charges should be based upon a carefully calculated percentage which will vary according to the estimated life of the particular class of asset. Whenever depreciation is made good by actual expenditure for renewals or reconstruction, such amounts should be charged against the corresponding depreciation reserves and thereby the balances remaining in these reserve accounts will show whether or not sufficient monthly allowances are being made year by year to provide for depreciation losses, shown by the actual expenditure for renewals and reconstructions. The necessity for depreciation reserve accounts being evident, the writer urges that particular attention be given to them in all public service accounting, and trusts that, in future editions of the Census classifications, statements of liability accounts will be included in which will be set forth in detail a depreciation reserve for each of the various classes of deteriorating assets.

Wooden Water Pipes in Australia.—In speaking at the opening of a new factory for making wooden water pipe, New South Wales, the Minister of Works said that the cast iron and steel pipe factories could not fully supply the requirements of the state. In giving figures of cost of pipes he said that the wood pipe here was lower. For example, a 3-inch wood pipe to withstand a head of 100 feet would cost 21 1-5 cts. a foot; cast iron, 45 cts., and steel 38 2-5 cts. With larger diameters and the same pressure a 12-inch pipe costs 72 1-7 cts. per foot and cast iron $1.55 per foot.

A 3-inch wood pipe weighs about 4 lbs. per foot, and cast iron 13 lbs. per foot. A 12-inch wood pipe weighs 15 lbs. per foot, and a cast iron pipe weighs 77½ lbs. It was estimated that with inland towns a saving of 50 per cent of the cost could be shown in the installation, thus making water extension possible in many cases where now impossible.

The pipe is constructed of timber staves, dressed on both sides, with galvanized steel wire, and then coated with a heavy coating of bituminous composition and wrapped with Hessian cloth.

It is expected by the Chicago, Milwaukee & St. Paul Ry. officials to have completed 70 per cent of the double track work between Chicago and the Twin Cities by July 15. As mentioned in a recent issue of Engineering Contracting, all contracts for the work have been closed.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Experience With Day Labor Work in the Maintenance and Repairs of Bridges in Chicago, Ill.

The numerous city bridges in Chicago are built and maintained by a division of the Bureau of Engineering of the Department of Public Works, this division being known as the Division of Bridges and Harbor. During the last few months this division has been made the subject of investigation by the Chicago Commission on City expenditures, popularly known as the Merriam Commission, and in the report of their investigation recently issued, some interesting facts are brought out respecting the efficiency and cost of day labor, maintenance and repair work on city bridges.

In conducting the investigation inspectors were sent out to take observations on the work of the men employed, with instructions to report on the amount of time worked by the men observed, the amount of time idle, the amount of time away from work, and to give such description of the character of performance as would indicate the degree of efficiency of the laborers under investigation. The observations were made chiefly by six men who were men of practical experience as carpenters, rodmen, or inspectors of construction work. Subsequently, an expert bridge engineer was secured to make estimates of the time and necessary labor cost required for such repair jobs as it seemed practical to investigate.

The reports of the inspectors showed generally a material loss of time due to loafing and poor management. Specific figures of lost time are 40 per cent for painters; electricians 14 per cent, machinists 32 per cent, and carpenters 28 per cent. Study of the system of accounting showed inaccuracies and omissions and generally unsatisfactory conditions throughout. The most specific dates, however, are contained in the report of the special expert, Mr. W. W. Curtis, M. Am. Soc. C. E., which we reprint substantially in full as follows:

The work of the Bridge Department naturally divides itself into two branches: The design and supervision of new construction, and the maintenance and repair of present structures.

New Work.—The number of new bridges built by the city during recent years has been small. There have been new structures erected during the last two or three years, however, at Erie, Kinzie and Polk streets. The bridge at Madison street has had large repairs made to it, necessitated by a collision with a boat. All of this work was done by contract. Bids were received from a reasonable number of contractors, the work was awarded to the lowest bidders, and the cost completed shows but little, and that natural, variation from the expected cost, based upon the prices bid and the quantities given in the invitation to bidders.

I have made inquiries, personally and confidentially, as to the manner in which the specifications have been lived up to in the execution of this new work. I have every assurance that the contracts have been carried out substantially and that there has been no connivance at poor work or skimped quantities. Nor can I learn that there has been any petty grafting on the part of inspectors. I believe my information along these lines to be reliable.

The Madison street bridge repair was emergency work. The price paid was large, but the conditions imposed on the contractor were severe and the work was worth the cost.

Rumors having reached me that the contractor had been helped by the City Repair Department in an improper manner, by having the city forces do work which properly was the duty of the contractor, I made a careful examination of the facts, so far as available. I find only one instance in which the daily reports of the city forces indicate any such condition. It is, perhaps, questionable in this case whether the work was properly contract work or not, and I have no criticism to make on the decision of the Bridge Department.

The printed annual reports of the Department of Public Works give the gross cost only of substructure and superstructure of bridges completed during the year. I recommend that this be supplemented in the future by a statement in detail of the estimated and actual quantities and costs, so that any one can check the estimates submitted to bidders with the actual quantities paid for. I also recommend that in this statement the cost of engineering be given, separated into cost of designing and cost of supervising.

The cost of engineering on the three new bridges recently built, as determined by your representatives, emphasizes the necessity for this information. According to the payrolls of the Bridge Department, the engineering on the Erie St. bridge has cost $30,146.99; on the Kinzie St. bridge, $17,344.04. These bridges were designed by the City Bridge Department, and the costs above include the expense of preparation of the plans and specifications.

For the Polk street bridge, the plans and specifications were purchased from private parties, and the engineering cost on this, amounting to $14,859.97, covers only the supervision during construction.

If these were the real costs of the engineering on these jobs, they would be inexcusable. The cost of each of the bridges is from $165,000 to $215,000. The usual charge of entirely competent engineering firms for inspection and field supervision would be 3½ per cent of the contract price. Their charge, including plans and specifications, would not exceed 7½ per cent on bridges of the type in question. These commissions, of course, include large compensation for the responsible engineers.

The City Bridge Engineer has submitted a statement to the Commission showing what the charges of engineering include. It appears that the records of the department do not represent the facts. It has been customary to charge the expense of any engineering work called for in connection with projects for which there is no appropriation to some other job which has an appropriation. Mr. Pihlfeldt, Engineer in Charge of Bridges, explains that he is repeatedly called upon for designs and estimates without any provision of funds to pay therefor.

The remedy for this, of course, is an appropriation annually of an amount sufficient to cover whatever expense of this nature the Council sees fit to incur. Evidently, the greatest safeguard against improper or injudicious expenses is publicity of financial statements. What such statements can be good for, when they do not represent the facts, is beyond my comprehension.

My attention was called to the contract under which $20,000 was paid for the plans, specifications, and royalty on the Polk street bridge. This is a bascule structure and one which required some special modifications in order to clear a railroad track at one end.

The Sanitary District, at one time, contemplated building this bridge for the city, and had purchased the plans and the right to use the patented design at an expense of $18,000. Later this arrangement was abandoned, leaving the city to build its own bridge. The right to use the patented design, however, remained. The design as made apparently interfered with the railroad track above mentioned, and in February, 1907, the Chief Engineer of the railroad wrote the Commissioner of Public Works recommending the structure of a competitive company, which had been designed to clear this track.

It should be understood that there are several types of bascule bridge in use, most of which

are patented, and one, developed by the City Bridge Department, which is not patented. The mere fact that a particular type is covered by patents, and that consequently a royalty must be paid for its use, should not condemn it. The city should adopt that design which will produce the best bridge at the least ultimate cost, whether it be its own design or some other.

The Department of Public Works also is that authority which should decide for the city on what is best and cheapest. In this particular case, the City Bridge Engineer reported the regular city type of bascule would not suit the situation, and, while it could be modified so that it would, the cost would then exceed that of the patented structure recommended by the railroad. The City Engineer recommended that if the city designs were not to be used, the work should be thrown open to competition.

The payment of $20,000, without any competition or any attempt to utilize the license for which the Sanitary District had already paid $18,000, is properly a matter of serious criticism; especially as constituting a precedent for subsequent actions of the same character.

REPAIR AND MAINTENANCE.

I have examined the reports on the work of the painters, electricians, carpenters, machinists and structural iron workers. I have also examined certain of the jobs on which these men have worked. The efficiency of all these branches except the last has been very low. Whether the structural iron workers are really more efficient or not, I am not sure. I have been asked to pass on the efficiency of the men on the basis of what their work costs, compared with what it should have cost. It is a very easy thing to under-rate difficulties which may have existed in estimating work which is completed; just as it is equally easy for a foreman to exaggerate these difficulties. I have consequently only been willing to criticise unfavorably work which was so conditioned that considerable complications could be eliminated and a fair estimate could be made.

In the only instance of this kind I found affecting the iron workers, the cost of the work as drawn off the daily report sheets compared very favorably with my estimate. In this case, my judgment was fortified by that of a contractor for steel erection, who visited the bridge with me.

Painters.—The work of the painters has been investigated in a number of instances, in every case showing very excessive cost.

The labor cost on the Loomis street structure was $1.53 per ton. Mr. Pihlfeldt testified at the hearing before the Commission that this was a reasonable cost. I think he is mistaken. My opinion is that even done by day's labor it should not have cost over one-half that amount. I have had propositions made me verbally by two contractors—one an erection contractor, the other a metal-painter contractor—to clear and paint this bridge for 60 cts. per ton for the labor. On some bridges of the same type, across more congested portions of the river, this cost might reach 85 cts. per ton.

The bridge house at the North Western avenue bridge was painted in November and December last. It took two painters 14½ days, or 29 days' time, to do the work. Your estimators report the house to measure 23½ squares which were varnished, and 21 squares which were painted. They estimate a fair cost per square for varnishing to be $1.47, and for painting 88 cts. Mr. Pihlfeldt has testified that $1 would be a fair price for painting. When questioned in detail, however, he stated that a day's work for a painter on some of these houses would be 8 squares; and on those badly cut up by switchboards, etc., 5 squares. A painter's rate is $4.40 per day, which, at 8 squares, would be 55 cts. per square, or at 5 squares 88 cts. per square, or just what your estimators figured. According to your estimators' figures, the total cost of labor on this building would be $54. The actual cost was $123. Using Mr. Pihlfeldt's figure of $1 for painting and increasing the estimated cost of varnishing to correspond, the cost should have been $69.

The allowance of 85 cts. per square means that a man at 55 cts. per hour should cover a space of 10x10 ft. in 1 hour and 36 minutes. Considering the fact that bridge houses are not very elaborate or decorative buildings and the work is plain, unquestionably a contractor would demand and secure this rate of speed.

The bridge house on the Eighteenth street bridge required 26½ squares of painting, which at 88 cts. would have cost $23.32, or, at Mr. Pihlfeldt's figure, $26.50. The actual cost was $132.

The bridge house at the Ninety-fifth street bridge required 12 squares of painting and 12 of varnish. At the rate of 88 cts. and $1.47 for painting and varnishing, respectively, this should have cost $28.20. It did cost $52.80.

As a commentary on the work of the painters, please note that while Ninety-fifth street house had 24 squares, as compared with the 26½ squares at Eighteenth street, one-half of the former was varnished work; so that the cost of the smaller should have been slightly greater than that of the larger. As a matter of fact, it cost less than one-half—$52.80 as compared with $132.

The house at the North Halsted street bridge shows a cost about seven times a reasonable one.

The one at Archer avenue cost about five times a reasonable cost.

At the Van Buren street bridge there has been some dispute as to the actual amount of painting done. Your estimators conclude there was not over 27 squares, at a cost of nearly six times a reasonable one. Even if all the surface claimed by the foreman is allowed him, the cost is 2¾ times a reasonable one.

These comparative costs correspond well with the apparent efficiency of the painters, as indicated by the record of observations.

I am unable to discover any good reason for maintaining a painting department. This is never emergency work. It can be done better and cheaper by contract, and I suggest for your consideration a recommendation that the department be abolished.

Electricians.—The work of the electricians was checked up at the Kinzie street bridge, where in January last they had done certain work which could be positively identified. It consisted in making up and placing about 200 ft. of 1½-in. pipe, pulling wire into it, drilling holes into and cutting a small amount of concrete; with certain other work connected therewith. All of this was itemized on the daily report sheets, so it was possible to figure out the amount of time spent on each item.

The actual time, as well as our estimated time, is shown in the table herewith. The amount estimated is very liberal.

Kinzie Street Bridge.	*Actual time spent. Hours.	Estimated time required. Hours.
Transferring material	24	16
Drilling concrete	32	8
Cutting concrete	16	8
Making and installing 1½-in. conduit	120	64
Pulling 2/0 wire	16	16
Wiring switchboard	16	16
Making kicking coils, etc.	16	16
Fitting up pole board	16	8
Hanging pole board	8	4
Wiring pole board	16	8
Connecting pole board	8	4
Total	288	168

*As shown by the foregoing daily report.

The foreman, Mr. Ross, attempts to explain the time spent in making and installing the conduit, on which was the largest waste, on the theory that it was necessary to tunnel under the walk, and that this could not be done by pick and shovel as usual, but had to be cut out with a bar. As a matter of fact, the tool used in this tunneling was Mr. Ross' imagination. After my first visit to this work with Mr. Weir, who had measured and estimated it, I sent him back to determine how the men had got under the walk, suspecting that the space was open on the adjoining property. He reported that he could get under the walk in this way. Ross testified that the conduit ran under a wood and also a concrete sidewalk. As a matter of fact, it is under the wood walk only. It runs to where the concrete begins, and there turns up to the surface and extends up the pole set at the curb. To install the pipe, a hole was cut into the end of the pavement and curb down to below the level of the adjoining wood joists, giving easy passage from below the wood walk to the street surface. Below the wood walk was sufficient space to permit the ready assembling of the pipe.

After Ross' testimony regarding tunneling, I revisited the bridge with Mr. Weir, got underneath the walk from the adjoining property on the north, and found no difficulty in getting from one end of the pipe line to the other. There was no occasion for any tunneling or any excavation of any consequence, and every indication that there was none done.

The attention of the Commission is called to the reports of the watchers on the electricians, as well as to the foreman's testimony at the hearing.

Carpenters.—The carpenter force during November last built two small police houses, such as are used at the various bridges for protection for the officers on duty there. One of these houses was for the Adams street bridge, the other for the Jackson boulevard bridge. The houses were built at the Eighteenth street shop of the city. The Adams street house cost for labor, not including any painting or cartage, $96. The Jackson boulevard one cost for the same $79.30. The material for one house figures to have cost $23.20, making the total cost for material and labor in one case $119.20 and in the other $102.50.

One of your estimators, Mr. Schutt, has had several years' experience in architectural work, and he prepared a plan and specifications covering the house, asking bids from two contractors thereon. One party bid $75 for one house, or $50 each for five or more. The other bid $75 for one, or $53 each for ten or more. The estimator's judgment for the labor on one house was $17.40, making a net cost of $40.60.

The cost to the city, as given above, includes no charge for use of shop, foreman's pay, nor, of course, any profit. Mr. Schutt's allowance of $17.40 for labor represents 3½ days for one carpenter, which I think is ample.

In justice to the foreman, it should be noted that he reports these houses to have been made entirely by hand, everything being ripped and dressed by hand from rough stock—"just as it would have been done fifty years ago." The paneled doors, window frames and sash were so made. Whether this indicates an error in judgment on the part of the foreman or of his superiors, is not very material to this investigation. It is the department we are investigating, primarily.

As the city probably uses a number of these houses each year, I can see no reason for not contracting for a year's requirement.

Two scows were built during the year—one by the foreman on the North Side and one by the foreman on the South Side. The first built a scow 43 ft. 4 ins. x 18 ft. 6 ins. x 5 ft. 8 ins. As indicating the value of the records of material supplied, your estimators find charged to this scow 9,305 ft. of lumber, while the scow itself, as measured up, contains 13,180 ft., without any allowance for the item of waste, upon which much stress was laid by the foreman when testifying. If the material found but not billed be added to the items charged to the job, the total is 15,301 ft., of which 2,121 ft. cannot be found. The shopkeeper's reports show no lumber returned. The total cost of labor on this scow, including no charge for foremen or superintendence, is $1,356, or about $103 per thousand feet of lumber.

The second scow, built by the foreman on the South Side, at the Eighteenth street shops, was smaller, being 38 ft. 8 ins. x 16 ft. 2 ins. x 3 ft. 5 ins. This should, of course, cost less in total, but might be expected to cost slightly more per thousand feet of lumber. The discrepancy between the material charged and that actually found is much less in this case, amounting to only 7½ per cent. The total cost of labor was $531.27, or at the rate of $61.77 per thousand.

In order to fortify my own judgment as to what would be a fair cost of labor on this class of work under the conditions existing, I have advised with several contractors, two of whom have worked on the Chicago River for years and who know the conditions. They have recently built similar work. They were both of them practical superintendents. One advised me $30 and the other $35 per thousand as a reason-

able labor cost for scows of this size. I consider the higher amount to be an entirely fair criterion by which to judge the efficiency of the carpenters on this work.

The same two foremen have been in charge of the reconstruction of draw-protections during the years 1908 and 1909; the South Side foreman building the one at Adams street, and the North Side foreman the one at Rush street.

The Adams street bridge protection is charged with 53,250 ft. of lumber, of which 43,750 are found in the work, 4,526 ft. were returned to the yard, and 4,974 ft. are short. Mr. McKinley, Foreman of Carpenters, states that some material was used repairing damage done during construction, but there were no special reports made covering such loss, and it could not have represented a very large amount, anyhow. He also claims a considerable waste on this work, but declined to commit himself as to what a reasonable waste would have been.

This amount of shortage would be equivalent to 20 pieces of 12 x 12 x 20 ft. long, or twice that amount of 6 x 12 material. Nothing but a catastrophe would account for such a loss.

The total cost of labor on this work, including cutting off and lining up the piles, framing and placing the lumber, is $2,942, or at the rate of $67 per thousand. If the cutting and lining up of piles is allowed for at $2 each (twice what it should cost), the framing and placing of lumber cost $57.75 per thousand.

Again to fortify my own judgment, I had three practical contractors place a fair labor cost on this work. One of these gentlemen was not very familiar with work on this river, so I have not considered his estimate, which was actually the lowest. One of the others estimated a fair cost as $18 and a liberal cost as $22. The other reported that he was now doing work of a similar character and under the same conditions at a cost of $20, which he seemed to consider quite high.

The Adams street protection was built between March 22 and June 3, 1909. The Rush street protection, built under Mr. Carmody's direction, was begun March 16, 1908. The time taken off the rolls by your estimators extends from this date to September 10, 1908. The job is not yet completed and no work has been done since the last date. Thirteen thousand eight hundred and forty-two feet of lumber are now on the job waiting to be used, and have been there since September, 1908.

The amount of lumber charged to the job is 99,011 ft. The amount found built into the work is 72,132 ft. Mr. Carmody claims he used some of the material in the construction of the north sidewalk on the bridge, but his reports fail to show any such use. Your estimators have figured up the amount of this walk, however, and find it to be 1,050 ft. Mr. Carmody testified that there was a large amount of timber used in repairing done by vessels during construction, and was very positive that his reports would show the amounts so used. We have been able to find only one such report, covering 936 ft. He also states that 3,850 ft. were used in building a temporary sidewalk at the southeast end of the bridge. Unfortunately, no reference to this temporary work is found in his reports, nor does it appear what became of the lumber when the temporary walk was removed. I think it is safe to neglect this item in balancing the amount of material furnished and the amount used.

Deducting the lumber found in the completed work, the amount claimed for the north walk, the amount reported used in repairing after accidents, and that stored on the job, from the amount charged to the job, there is a deficiency of 11,051 ft., or 11 per cent. Such a shortage is unexplainable except on the theory that during the eighteen months since any work was done much has been taken away without authority.

The total charge for labor has been $4,777.25. The amount of labor used in the protection has been 72,132 ft., making the labor charge per thousand $66.23. Making the same allowance for the piles sawed off as in the Adams street protection, the net cost of framing and placing lumber is $58.21 per thousand.

In Mr. Pihlfeldt's opinion, the Adams street work should have cost more than the Rush street, because of its lesser accessibility to scows. In my judgment, the difficulties surrounding these jobs have been much exaggerated. I think any contractor who found the labor cost exceeding $20 per thousand would immediately get another foreman.

Machinists.—I looked over several jobs performed by the machinists and selected the East Division street bridge as the simplest and fairest one to check.

At this bridge the center lock had been operated by an electric motor, located near the center of the span and geared to a transfer shaft, to which are attached the locks, which are of the projectile type. Difficulty being found with this mode of operation, the motor was removed and a cable, manipulated from the bridge house, was substituted to rotate the shaft which operates the locks. Mr. Wehr and I made an estimate in detail of the time necessary to do this work, allowing 60 hours' time for handling the boat from which part of the work was done. Our estimate amounted to 340 hours, while the amount charged to the job was 822 hours.

I called on the foreman and asked him to itemize the time required for the various parts of this work. Omitting lost time, his estimate was less than ours, but he claimed a great loss on account of bridge movements. When testifying, he said that about two-thirds of the time spent on this job was wasted, due to interruptions from boats. This allowance is just about the amount necessary to raise his detail estimate as made for me to the actual time.

In my judgment, the explanation is not sufficient. Making every allowance that is at all reasonable, one-half the time on this job was wasted.

This foreman had five or six different jobs going on at separate bridges and could spend only a short time each day with each. His men simply soldiered on him.

Conclusions.—I have not attempted to determine the average efficiency for the department. The important question is how to remedy the evident inefficiency.

To secure good work at fair cost, there is necessary good workmen, an efficient foreman, strict supervision, and accurate accounting. In public work, two other things are required—the right to discharge men below the grade of foreman without any formalities, and publicity of accurate records.

I have no reason to suppose the workmen employed by the city were not once competent. Whether they can be induced to perform a good day's work in eight hours now, after years of loafing, in some cases may be doubtful. Without the right of a foreman to discharge them, it is not doubtful.

Some of the foremen who testified clearly demonstrated their entire unfitness for their positions. Their attitude on the stand, with the record of the results they have produced, is recommended to the consideration of the Commission.

I believe that some of them, properly supported and stimulated by being held to an accountability for future results, will serve the city well. No man will continue to exert himself to produce the best results for ten years against political pressure and with no knowledge on his own part or on those of his superiors of what his work is costing. All of the total costs of work, as well as the unit costs, given in this report, were prepared by your employes from the daily reports. I do not believe that any of them had ever been figured by any of the city employes. Only on the simplest work is it possible to merely look at a job and tell in gross what it should cost. It is necessary to estimate it in detail or to reduce the work to units to determine what a proper gross cost should be.

Part of the work now done by city forces could better be done by contract. The temptation with a city force is to keep the men, whether there is work for them or not; which means nursing a job when the work in sight is small. The man who loafs on a job at one time is apt to loaf all the time. All the painting and nearly all the carpenter work could better be done by contract.

Before beginning any repair work by city employes, the foreman should be required to submit a detailed cost estimate of the material and labor required to complete it. The job should then be examined and reported on by an assistant engineer and approved by the City Bridge Engineer.

After the work is completed, the cost should be figured up by the clerical force, reduced to units where possible, submitted to the Bridge Engineer, and be approved or disapproved by him in writing. His disapproval, of course, should be followed by charges. These records should be public, and should be embodied in the annual reports. This would definitely locate responsibility and would make very easy the checking of results by public organizations.

Eighteenth National Irrigation Congress.—The National Irrigation Congress will hold its eighteenth session at Pueblo, Colo., on Sept. 26 to 30. The program will include addresses and papers by Experts in Irrigation and Forestry, including public officials and eminent citizens. Foreign Delegates. Governors of States and Territories, Senators and Representatives in the Federal Congress, Statesmen and Scientists. Industrial and financial leaders. Promoters of Cary Act Reclamation Projects. Officials of private irrigation enterprises. In connection wit hthe Congress there will be an exposition, international in scope and character, which will include machines and devices for the development of power used in irrigation and drainage, methods and devices for the transmission of power used in irrigation and drainage, machines and devices for raising surface and ground waters for irrigation and drainage purposes, methods and devices for distributing water to users thereof and to lands, machinery, devices and methods for the economical cultivation or irrigated and agricultural lands, plans or models of existing or contemplated irrigation and drainage systems, and products of agricultural and horticultural lands; literary, graphical and pictorial presentation of knowledge, pertinent to the subject of irrigation and drainage, including precipitation, evaporation, percolation, geology, forestry, sociology, irrigation policies and irrigation civilizations; miscellaneous exhibits, including measuring instruments and devices, weirs, rectangular, trapezoidal, automatic water registers, smudge pots, spraying devices. L. M. Markham, Pueblo, Colo., is Director of Exhibits.

Repairing Brick Sewer.—The following method of repairing a brick sewer was employed at Worcester, Mass, by Matthew Gault, Superintendent of Sewers. The sewer was built in 1870 and the bricks were soft, the cement poor and sparingly used and the grade steep. The result was that many of the brick in the bottom of the invert were loose and badly worn and the sewer in a dangerous condition. The sewer is a 24x36-inch oval and, as it was necessary to lay hose inside of the sewer to provide for the large flow of sewerage from the district above, the space availage for working was very much contracted. The work was done in sections. At the upper end of each a sand bag dam was placed. Two and sometimes three lines of 3-inch pump hose, 60 feet long extended through the dam thus taking the flow and keeping the invert dry. When a connection was encountered an extra line of hose was laid to accommodate it. The hose were supported on short strips of boards laid across the sewer about 6 inches above the invert. From three to four inches of cement mortar placed in the invert and carefully troweled completed the work. After the cement had hardened sufficiently to withstand the flow of sewerage, the dam and hose were moved ahead.

The Coastwin Dredging Co. is at present working two dredges, five tugs and 16 scows on its government contract for dredging the harbor at Norfolk, Va., for deep water in Hampton Roads to the junction of the eastern and southern branches of the Elizabeth River. The contract was let at 7.3 cents per cubic yard and up to June 15 6,000,000 cubic yards have been taken out. It is expected that the work will be finished one year ahead of contract time

The Fundamental Principles of Efficiency.*

It is of "efficiency" in railway operation that I wish to speak to-night, and I define "efficiency" as attaining standards of time, place and cost. In spots there is very high efficiency in the operation and maintenance of American railways, but the easily determined wastes due to preventable inefficiency still aggregate one million dollars a day; wastes that would as inevitably disappear, if properly attacked, as the inequalities revealed by a railway survey disappear when the cuts and fills are finished for any predetermined grade and curvature. It costs to build a railway with low grades and mild curves, *but as a rule it not only does not cost to attain high efficiency, but high efficiency of operation and maintenance always results in lessened costs since high efficiency means the elimination of waste.*

Costs, operation, difficulties take care of themselves the moment we forget all about them, and substitute the one ideal of "efficiency." The practical results of substituting the ideal of efficiency for worry about costs is shown in the diagram above, in which the efficiency of labor, in the same shops, with the same men, the same equipment, the same foremen, and on the same schedules was gradually increased from 55 per cent to 93 per cent, the cost of locomotive repairs dropping over $1,000 each, yet the locomotives averaged heavier, hauled more tons and made more miles per failure. If this road had 2,000 locomotives the direct saving was over $2,000,000, but in addition each locomotive hauled 3,300,000 more tons and in one year the net earnings increased $3,000 per locomotive, an additional gain of nearly $6,000,000, due to the ability to haul more freight.

One railway in the United States maintains its freight cars for $37 per annum. Another railway in similar service spends over $100. The $37 cars cost $100 less to build, weigh 6,000 lbs. less for the same capacity. At $37 on 50,000 cars there is an annual saving of $3,150,000 in maintenance cost alone below the rival figures.

Efficiency, like any other branch of applied knowledge, has its own laws. These laws are absolute. You cannot have high and continuous efficiency if any one of these laws is neglected. Wherever there is high efficiency it will inevitably be found that it is attained by observance of one or more of all these laws.

These principles are twelve in number.

(1) *Inspiration, enthusiasm,* the desire to accomplish.

(2) *Common sense,* usually flagrantly lacking in human affairs and to some extent on even the best railways.

(3) *Special Expert Advice.*—Specialists generally furnish the methods best suited to the principles as applied. The line officials use what is furnished. Few railway presidents would be competent to design a bridge, design a locomotive or freight car, design a steam engine or a dynamo, design a machine tool, or analyze tool steel or keep his own accounts. If the president needs expert advice as to all these matters, how much more does the worker at the bottom of the line need advice?

(4) *Discipline.*—Discipline means that there must be specific duties for everyone, and that he must perform them. Discipline does not mean severity, harshness, arbitrariness.

(5) *The Fair Deal.*—In spite of the ten commandments, in spite of the Golden Rule, in spite of all our laws and customs, in spite of the desire of most of us to have the other man do the fair thing, the fair deal is often lacking in the relations of employer and employe, of corporation and client or customer.

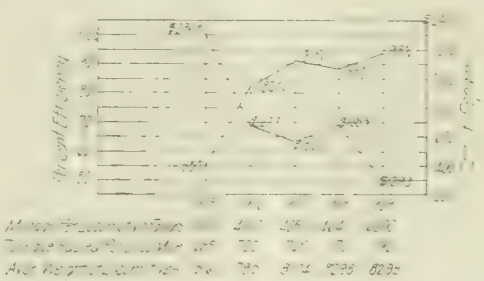
(6) *Definite and Specific Standard Practice Instructions.*—As to some matters—time tables and rules for train employes—these are very minute and exact; as to other matters wholly lacking. Most of the best shop practices are carried around under one's hat and are not reduced to writing.

(7) *Reliable, Immediate and Adequate Efficiency Records.*—These include cost distribution. Proper records give positive and incontrovertible knowledge. In usual operations nine-tenths of what goes on is guess work. Most of us would make the wildest guesses about the operations of his own body, and we know less about our own work.

(8) *Scheduling and Despatching.*—The principles of a train time table and control of train movement by despatchers can be and should be applied to shop and other maintenance operations.

(9) *Time study work* gives the necessary facts for proper schedules and despatching. Time study is a principle, not a method. There are many different methods just as there are many methods of determining a quantity of wheat—weight, measure, estimate, guess, counting the grains, etc.; that method is preferable which gives the greatest amount of accuracy in the shortest time and with the least trouble.

(10) *Standardized Conditions.*—You give the locomotive engineer both a locomotive and a clear track; you give him water tanks and coal chutes; you give him a set of signals. You rely far more on the conditions than you do on the man. The Pennsylvania



Railroad has more engineers than it has engines capable of pulling the 18-hour train. When conditions are standardized it is not difficult to find men.

(11) *Standardized Operation.*—When conditions are standardized it is easy to realize standard operation. It is an easier task to run the 18-hour train on time than to run a local freight. The more conditions are standardized the more we can demand a standard operation.

(12) *Efficiency Reward.*—Efficiency reward is a principle. It is one of the fundamental laws of the universe. The most efficient in some line or other obtain the biggest rewards. The most efficient have survived, the inefficient have perished. Every worker, from president down, ought to be compensated, partly at least, on the basis of his efficiency.

The particular form of efficiency reward is not a principle, but a method. In France they reward a lifetime of efficiency by a button of the Legion of Honor, which entitles a man to a military funeral. In England they give him a title; in China they bonus his ancestors; in this country he pulls down the money. The so-called bonus method is a definite increase of wages based on a definite and measurable increase of average efficiency. High efficiency is impossible for either man, gang or shop until many of the other principles have been recognized and made effective; therefore, a bonus is the last—not the first—thing to be offered. Upright and conscientious management, including foremen, good tools, proper work and health conditions precede bonus.

When I am given the privilege of examining the organization and operation of a large plant, it is not the details that interest me. The men about the plant are far more competent than I am to give an opinion as to details. I look for evidences of lack of common sense, for lack of discipline, for unfair conditions, for inadequate records, for unstandardized conditions, for unstandardized operations, and I base my estimate of preventable wastes on the observance of principles, not of details. It is not the system, the particular form of blank, that counts. It is the ideal behind any and all system that counts.

The methods used to determine losses are so positive, so absolute, so indisputable and so simple, that any competent committee of qualified experts could verify the conclusions, and the name of any one of fifty railways could be drawn by lot and a similar investigation would show that it was contributing its quota to the loss of one million dollars a day. Do not imagine that I, an outsider, am slandering a great business of which I know nothing. I have been intimately associated with railway planning and maintenance for nearly thirty years. I have also learned intimately about other businesses, and the losses complained of are universal and inevitable under our present methods of inadequate check.

Railway management is not worse than the average; it is, on the contrary, in many respects better. The railways of the United States, as to special operations, set up and realize as high standards as the world has ever seen. The 18-hour trains between New York and Chicago, the fastest and longest run high-speed trains in the world, maintain a standard of promptness of 99.96 per cent. A man living on the line could set his clock by these trains. Here is a case of: (a) Reliable records. (b) Standardized conditions. (c) Standardized performance. (d) Continuously attained.

In the accounting department standards are equally high. Not a cent is spent untraced, or without authority. Here also: (a) There are abundant records. (b) Standard methods of bookkeeping. (c) Specialized for the operation. (d) Balances have to be made.

The whole auditing and accounting is in the hands of specialists who take their inspiration not from the board of directors, not from the executive officers, but from standards that are not only older than railroading, but which antedate the discovery of America.

Standardized conditions in railway operation have already been referred to. Among the most important of these are track and way. No higher standards are conceived, created and maintained than the track, way and bridges of a first-class American road. Here again there are: (a) Records, not always adequate. (b) Standards of construction. (c) Standard realization. (d) The work being conceived and put into effect by specialists, engineers.

Enough to show that in these respects and many others American railways set up and realize high standards, and to justify what I am about to say as to absence in much of railway operation of: (a) Adequate and reliable records. (b) Standardized conditions. (c) Standards of performance. (d) Definite responsibility and reward. (e) Competent specialists.

Usually the man who best executes is not always the best man to create proper conditions, and the best creator is not always the best doer. A locomotive engineer, even though he takes the 18-hour train over his division in perfect manner every day, neither created the track, the locomotive, the despatching or the signal system, but, on the other hand, the inventors and improvers of these matters were never fitted for locomotive engineers. Let it not, therefore, be supposed that I am in any way criticizing the great operating contingent in American railways. They do what they can, and no higher body of men exists. My criticism of results is based, not on the inefficiency of the men, but on the: (a) Inadequate records. (b) Inadequate and inferior conditions. (c) Inadequate special skill.

To illustrate what I mean: There is no railway east of the Rocky Mountains in which locomotives ought not to be maintained in first-class operating condition for 5 cts. per locomotive mile. I go further, and believe 4 cts. is an ideal to be striven for and ultimately reached. This does not mean that if a railway only had two locomotives, and

*From a paper read before the Railway Club of Pittsburg by Mr. Harrington Emerson, and revised and amplified for the "Railway Age-Gazette," May 6, 1910.

they collided, the maintenance expense that year would not exceed 5 cts.; it does not mean that if there were so little business that each locomotive only made 10,000 miles in a year, 5 cts. could be realized; it does not mean that every locomotive or every division will come down to 5 cts., or that any locomotive on some divisions will come down to this figure. It does mean that any railway with 10,000,000 miles a year of mixed freight and passenger service ought to maintain its power for $500,000.

We actually find, however, astonishing variations for similar operations. Comparing the locomotive maintenance costs of five trunk lines operating between the same terminals between 400 and 500 miles apart, under largely similar conditions, in round figures, it costs:

Road A— 6 cents a mile.
Road B— 8 cents a mile.
Road C—10 cents a mile.
Road D—12 cents a mile.
Road E—16 cents a mile.

Assuming 30,000,000 locomotive miles a year, and a $0.06 a mile standard:

Road A wastes nothing.
Road B wastes $600,000.
Road C wastes $1,200,000.
Road D wastes $1,800,000.
Road E wastes $3,000,000.

My assistants and myself have been in the shops of all these companies, and, as to a large part of the loss, we know, in part, why and where it occurs. If, as to every minute operation, there were a standard and a record, showing actual cost compared with standard cost, it would be easy for every man, every foreman, every superintendent, to check what was going wrong. Many railway records are not available for six weeks after the fact has occurred, and as to many facts, not available for more than a year. It has been my experience that if you give a fireman a water-glass and a gage, he will watch them, and make a strong effort to maintain standards; and it has also been my experience that if standards are supplied to shop and track men and if records are available from hour to hour, a strong effort will be made to attain and maintain standards, and that it is just as easy to maintain a shop or roundhouse efficiency of 99.96 per cent as it is to maintain this efficiency in a train schedule.

In a very large locomotive shop conditions were first standardized, and then standards of performance were furnished. The shop went on as before, same equipment, same work, same men, same foremen and other officials, but standards as to his own particular duties were set up for every man.

The results were as follows:

Month.	No. of men.	Hours— Standard.	Actual	Efficiency.
1st	21	2,011.2	3,613.9	55.6
2d	50	4,350.2	7,418.8	58.6
3d	77	7,649.6	12,748	60.0
7th	251	27,051.8	41,463	89.3
12th	656	122,736.4	126,534.4	97.0
13th	731	129,357.5	129,478	99.9
14th	771	148,841	146,434	101.7
15th	819	155,276.5	160,701	96.5

The 819 men have by no means reached the highest efficiency, as is shown by the table of classification below, average wages assumed at $0.30 an hour and working hours at 250 in the month:

Workers	Average efficiency per cent.	Wages.	Bonus, per cent.	Bonus.
61	30.3	$4,575	.....	.....
32	45.0	2,175	...	.....
50	75.8	3,750	...	.....
72	64.6	5,400	.....	.....
216				
81	74.2	$6,075	1.1	$66.82
76	84.3	5,472	5.8	317.37
74	90.0	5,500	15.0	825.00
90	105.9	6,750	25.9	1,748.25
94	114.6	7,050	34.6	2,439.30
64	123.9	4,800	43.9	2,107.20
56	132.4	4,200	52.4	2,200.80
20	145.3	1,950	65.3	1,271.35
19	154.1	1,425	74.1	1,055.95
6	183.3	450	83.3	374.85
17	196.4	1,275	116.4	148.40
662		$61,147		$12,555.29
Total wages				$61,147.00
Total bonus				12,555.29
Average bonus per cent to bonus workers				27.9%
Average bonus to all workers				20.5%

If 603 men out of 819 earn bonus it is evident that the schedules are not severe.

In a particular gang of 32 men, an average efficiency of 95.8 per cent was attained, standard time being 7,211.6 hours, actual hours 7,523.5. The highest man showed 139.2 per cent efficiency, the lowest 7.8 per cent. These men were on the same kind of work, under the same foreman. Each man was receiving the same rate of wages. In the name of common sense and justice, what are you going to do with such conditions? Bury your head in the sand like an ostrich and pretend that these differences do not exist? Object, as some of the union officials do, to any records or checks that show up these differences? Assuming the cost per hour of operation being $0.30 for wages, $0.30 for machine charge and $0.25 for overhead expenses on the man, we have an hourly average operating cost of $0.85 an hour. The man and machine work 250 hours in the month at a cost to the company of $212.50.

The table shows how the cost of work per hour varies as efficiency varies:

Efficiency, per cent.	Hours.— Worked.	Standard.	Cost, per mo.	Cost, standard hour.	Relative costs.
60	250	150	$212.50	$ 1.42	167
100	250	250	212.50	.85	100
140	250	350	212.50	.61	72
8	250	20	212.50	10.62	1,248

This is an actual record—not an imaginary one—taken from a railway shop.

Are you going to pay full wages to the man who only delivers one-twelfth of a fair day's work?

Are you going to allow work to cost $10.62 that ought to be done for $0.85?

Are you going to pay the same wages to the man who does, in the same month, seventeen and a half times as much work as some other man?

Are you going to pay the same wages to the man who makes a given job cost $0.61 as to the man who makes the same job cost $10.62?

Everyone of the twelve fundamental principles are violated when such evils are not remedied.

Economy of the Piece Work System in Handling Supplies.*

If we are going to get the largest possible output for the smallest cost, we must interest the man doing the work more than paying him by the hour. A man's interest must be vital if we are to get the best there is in him. We must pay for what we get, and not for what we do not. We must get 100 cents worth of work for every dollar paid out. This the piece work system accomplishes, as its organization and introduction shows.

At first blush it would seem to be a difficult matter to resolve the handling of supplies into given factors or units. This is not so, as we have a unit to issue or receive everything we handle in the store department, and a record to refer to that is permanent. Lumber is handled per thousand feet B. M. Iron, castings, coal, sand, etc., are handled by the ton. Pipe is handled by the foot. Mixed merchandise is handled by per package of 100 lbs. or less, over 100 lbs. to 200 lbs., etc. Filling requisitions and delivering material to the shops is handled by per item, per piece or per pound, depending upon the kind of material and the local conditions.

Filling requisitions and delivering material shows a very large saving put on piece work, due to the amount of lost motion that creeps in under the day work basis. Shop men will ask what has happened to the store men after they have been put on piece work, as they no longer stop to talk, but drop the material and hurry away for more. The men group their work, taking or getting all the material wanted from the different sections at one time. One foreman, planning the getting and placing of material, is only one part efficient as compared with a whole gang of four to eight men planning the same thing. In establishing piece work for a delivery gang composed of foreigners, who did not know the material and could not understand English, the prices were based on what was considered fair. The foreigners could not make one-half their day rate with the prices set, and were transferred. English speaking laborers were hired in their place, and they, being able to use their heads, made from 30 to 50 cts. per hour.

The men should be given to strictly understand that after a price is approved it will not be changed unless conditions are changed. They can make as much money as it is possible for them to make, and will be paid accordingly. As soon as the men are assured that they will be paid for what they do they will work their heads as well as their hands and feet, and will take advantage of everything possible. For instance, in one of our yards a derrick gang use long bridge bolts to handle 6-in. cast-iron pipe. These bolts are put in the end of the pipe to slip the sling around, enabling them to handle very quickly six to ten pieces at a time. These bolts are carried on the derrick to be used when needed. When loading a small order the men run ahead of the derrick with bolts and sling and load the pipe without stopping. It is impossible to get work done this way at an hourly rate, but there is money in this method for both the men and the company, as shown below:

Work done on hourly basis on which price was based:

Labor	$2.50
Use of derrick	2.00
Total	$4.50

Work done piece work in one-half the time:

Labor, P. W. rate	$2.00
Use of derrick	1.00
Total	$3.00

Saving, $1.50, of 33⅓ per cent.

We had four men in one of our lumber delivery gangs and the day we were about ready to start piece work one man quit, and the other three refused to work until another man was put in his place. The piece work system was explained to the three men, and they were asked if they would do the work on this basis, which they agreed to do. Soon after, one of the three left the service of the company, and the remaining two are handling this work, together with a large increase, in about 70 per cent of their regular working time, making a high rate of pay. The company is saving one man's time and about 30 per cent of three men's time on this particular work.

At one of the large icing stations, where an average of 100 cars per day are iced, and some days as many as 250 cars, it was necessary under the day work system to take a large force of men from one of the other departments to help during rush hours. However, since piece work has been installed the regular force has handled the work without delaying a single train or having a complaint from the shippers. The men know the more they hurry the more they make.

On one of the scrap docks it was impossible under the day work system to keep the pile of miscellaneous mixed scrap sorted and cleaned up as fast as it came in with the regular gang assigned to this work, it being necessary to put on additional help to prevent congestion. Ninety days after piece work was installed the regular gang cleaned up this scrap without additional help, and now take care of it and have time to do other work; yet a better foreman than the man in charge of this dock cannot be found.

It is impossible to work unintelligent foreign laborers to advantage. A gang cannot be divided, sending one man for a given article, another to the shop for manufactured material and have others sorting out material. The foreman has to take the whole gang with him, or have part idle, to get even a given

*A paper by D. C. Curtis before the Railway Storekeepers' Association, St. Louis, Mo., May 16-18, 1910.

size of bolt or article of any kind, as the thing wanted has to be pointed out and motions used to direct their movements.

With the piece work system we are able to hold the men after we have them educated. In May, 1908, a storekeeper hired 50 Austrians who had just come to this country, and they, after becoming familiar with the conditions, were put on piece work. Thirty-five of the original 50 are still working for this storekeeper, one having died and the others leaving the service. The men are making good wages, and it is needless to say they are an efficient force. For increased and intelligent effort men make enough for the work to be attractive. The longer men stay, the more proficient they become, the more money they make, fewer mistakes and breakages occur, and discipline is easier.

Piece work keeps men and methods of doing work out of ruts, as the men are continually scheming short cuts and new kinks. It gives us machines and tools with which to handle work quickly. To show a saving in having machinery to handle material is a very simple problem in arithmetic when on a piece work basis; i. e., lumber handled by hand costs 5 cents to 85 cents per 1,000 ft., B. M.; with a derrick, 15 cents per 1,000 ft., B. M.

Piece work forces the storing of material in the most convenient places for handling. In one of the large new storehouses recently built the connecting rods for engines are kept in a closed rack in the center of the house, without lifts of any kind to handle them with. Piece work would very quickly show the saving to be made by putting these rods where they could be handled with a small crane at a great saving.

Piece work gives a contented set of men, each man in business for himself. Men would rather work piece work than day work, as is shown by the engine men and trainmen being paid by the mile, miners by the ton, etc. These men would not think of going back to the hourly unit. The rapid, intelligent workman receives wages in proportion to work done; ability is paid for.

The Compensation of Workmen.*

In any discussion of this subject, however much we may differ as to the means by which our end is to be accomplished, we all must agree that if there is a final solution it must be an equitable one. Any solution, therefore, which is based upon the ability of the more powerful party to impose its will on the other, is only temporary and liable to be reversed. High wages can only be paid permanently for high efficiency, and any attempt to get high wages without a corresponding efficiency can only be temporarily successful. This is an economic law, and any man or body of men that exacts a compensation out of proportion to the service rendered will ultimately come to grief.

Turning to the workman we ask why is he inefficient. A little consideration of the methods of compensation that oftenest exists leads us irresistibly to the conclusion that there is but little inducement offered to him to be anything else. We can hardly expect him to understand the importance of a subject so many better educated people so utterly fail to appreciate, hence the only inducement that appeals to him is the immediate one of increased pay. We must not expect him to learn any more than this except by a long series of object lessons. It is therefore up to the educated man to learn economic laws and set the workmen an example by conforming to them.

Under the system of day work that oftenest exists but little provision is made for awarding extra compensation to the efficient man, and under the most common form of piece work, he is liable to be penalized by having his rate cut if he does much more than was expected.

There are in many plants, both among the mechanics and clerks, men who are far more capable than the average, and who, if they had a chance, could do much to increase the efficiency of the whole plant by teaching their methods to those whose methods are less efficient. The question at once arises as to why we do not make foremen of such capable mechanics, and the reply comes just as quickly that they often have no ability as executives and make very poor foremen. We realize, however, how much the efficiency of the shop would be increased if the other workmen had their efficiency. The best way to get this increase of efficiency is to make our expert men instructors, and award additional compensation to those that learn. This is a step in the direction along which we have been working, and according to which, in its best development, we have succeeded in increasing the average efficiency of shops to a point greater than that of the best workmen before we started.

In brief, our method is to put into the shop a system of orders and returns that ensures any work being done as we direct. Then each job is analyzed by the best expert available, who specifies the sequence of the operations and ultimately how they shall be done. Plans are then made and orders issued to have the work done as the expert directs. Finally, each operation is studied in detail by an expert, who determines the best method and shortest time in which it can be performed. A task is then set in accordance with the study of the expert, who gives detailed written instructions for carrying out his methods.

The workmen are paid additional compensation when they accomplish the task in the time and manner specified, and the foreman, who acts as an interpreter of the directions of the expert and an instructor, is awarded additional compensation for each workman who performs properly each day all his tasks. In order that the foreman may be induced to give his attention to the least efficient man, he is given additional compensation if all his task workers succeed.

For several years past the writer has been training workmen on the lines indicated above, and although his work has usually been with people older than the ordinary apprentice, his results have been successful to a degree entirely unanticipated. About five hundred of those so trained are textile workers who are now earning at an average of 40 per cent more than previously, and turning out over 100 per cent more work, some as much as 300 per cent more. The average wage cost per unit has been reduced to about 60 per cent of what it was.

One other result, which was to be expected in a general way, is that the trained workman, working under expert teachers, should also produce better work, but we were not quite prepared to find the extent to which this was so in some cases.

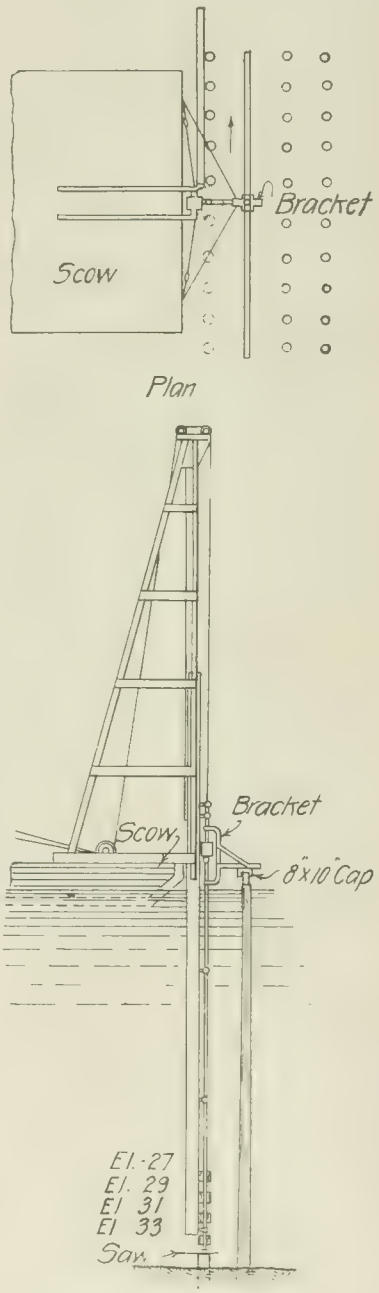
If we wish to improve the ordinary workman up to a point where his work compares favorably with that of the efficient workman, we must do so by making it to his financial interest to learn, and to that of the expert workman to help us teach, for the ordinary workman must be taught and trained.

*Extracted from a paper by H. L. Gantt read before the National Metal Trades' Association, New York, April 14, 1910.

A Machine for Cutting off Submerge Piles to Exact Elevation.*

The heads of the rubble mound breakwaters at Superior Entry, Wis., will consist of large timber cribs filled with stone ballast and seated on a foundation of piles cut off at an elevation of 2 ft. above the bottom of the lake and a maximum depth of 35 ft. below low-water datum. These piles are jetted in place with a water jet working under a pressure of 600 lbs. per sq. in., and then settled to their final bearing with a 3,500-lb. hammer. They are placed butt ends down and driven from 15 to 18 ft. in the sand. It is necessary that these piles should be cut off at an even grade for the reception of the cribs.

Ordinarily the work of cutting off piles under water is performed by divers, by machines using either circular or straight crosscut saws working from a trestle or by machines working from floating scows. In the case under consideration the conditions as to depth of water, risk from storms, and the interference with work on account of the existence of rapid currents, necessitated the design of an original machine for performing this work with accuracy and dispatch. With this in view a set of ordinary pile-driver leads was erected on a small scow, as shown on the accompanying drawing. A vertical beam 12x16 ins. x 56 ft. carries a steel shaft 3 7-16 ins. in diameter and 50 ft. long. This shaft is mounted on the beam with proper standards as shown, and the beam with the



Device for Cutting Off Submerged Piles to Exact Level.

shaft is installed between the leads in such a manner as to travel vertically by means of a small hoisting engine on the scow to any desired elevation. A 48-in. circular cross-cut saw is attached to the lower end of the steel shaft, which is rotated by a belt connected with the driving engine on the scow. The steam is furnished by a 30-hp. horizontal boiler for the entire plant.

The special feature of this machine is the guide bracket constructed of steel and equipped with two double flanged trolley wheels designed to move on an 8x8-in. timber cap which is placed on the row or bent of piles just forward of the row which is to be

*From a paper by Clarence Coleman in "Professional Memoirs," Vol. II, No. 5, U. S. Engineer School, Washington, D. C.

cut. These caps are moved ahead one row as often as the row immediately behind is cut and are lightly spiked in place until the next row has been cut, and so on until each row or bent has been cut. For cutting the last row, three special piles are driven for carrying the cap and afterwards removed. As stated, the guide bracket is the special feature, in that it insures cutting the piles to a perfectly even grade at the depth desired. It will be seen from the drawing that the bracket when its wheels rest on the cap fixes with great exactness the vertical distance between the top of cap and the saw, the elevation of the cap having been carefully determined by instrumentation from a U. S. B. M.

The shaft is rotated at a speed of 500 revolutions per minute, and the scow itself is controlled by proper lines operated from winch heads on the engine. The work is done very rapidly. With good weather and quiet water, the machine has frequently cut 45 miles per hour. The accuracy of the grade can be checked by measuring the cut-off piles and only errors of a few hundredths of a foot have been discovered. Delays occur through inability to clear away the cut-off piles, for which the machine is in no way responsible.

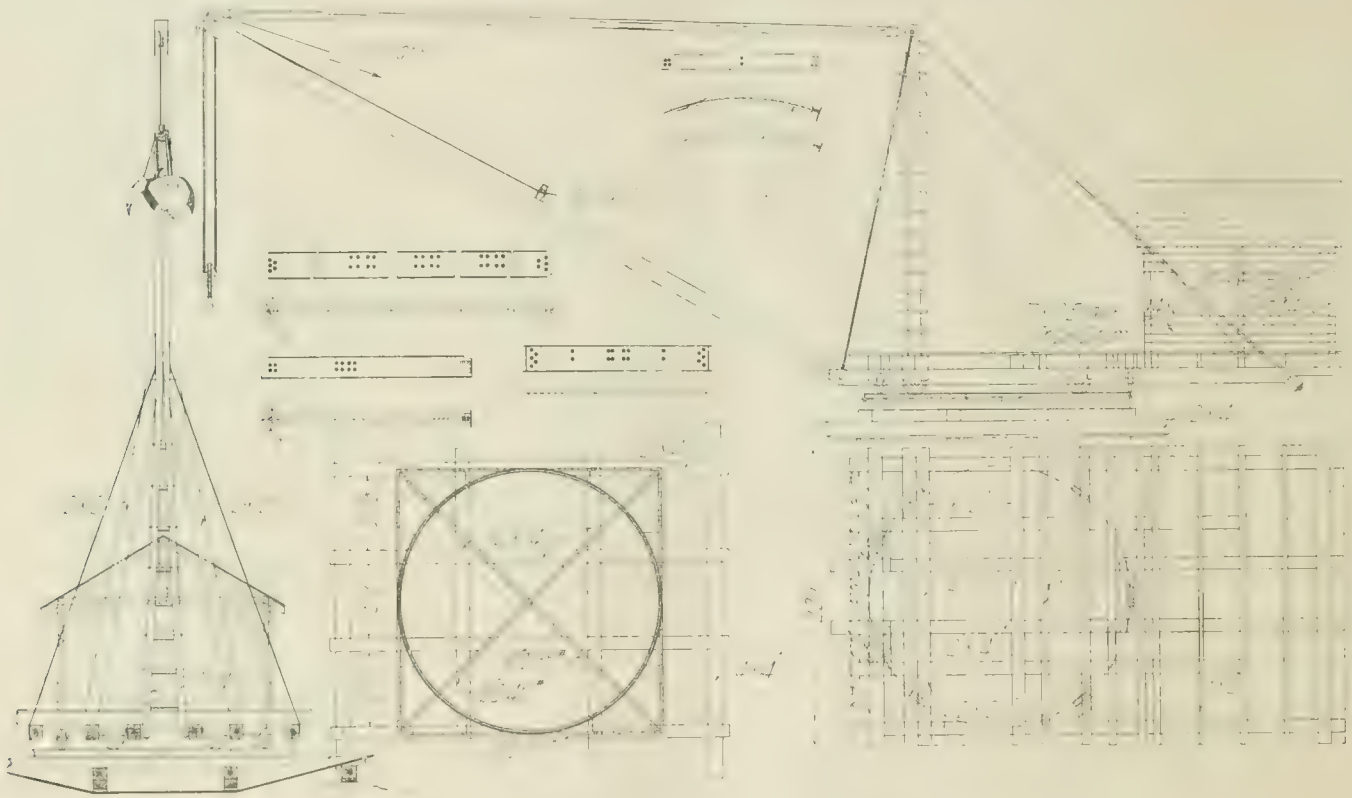
For the operation of this machine seven men are required on the scow. Five other men are engaged in taking care of the piles as they are cut off and cutting off piles above water and placing the caps for the guide bracket. The total cost per 8-hour day for crew, fuel and oil was $36.15. The results obtained may be tabulated as shown below.

Time actually worked, 5 hrs.
Time worked, including transfer of machine and setting it in position, 7 hrs.
Number of piles cut off, 230.
Average time to cut off one pile, based on 5 hours' actual running, 1.3 mins.
Mean cost per pile at 230 piles in 7 hours, $0.1375.
Error of cut-off, ¼-in. and less.

On several occasions a bent containing 10 piles was cut off in 6 minutes. Diameter of piles at cut-off point was from 11 to 19 ins.

The work done by this machine could not be performed by a diver with such uniform accuracy. A day's work for a diver operating a hand saw rarely exceeds 20 piles. The average cost of a diver with his outfit in this harbor is $40 per day. This would mean a cost of $2 per pile as against 13.75 cts. for the machine, or $5,000 for cutting 2,500 piles as against $343.75 for the same work with the machine. From the foregoing description of this machine, it is easy to see that where the work to be performed is considerable, as in this case, there can be no question of the economy of the machine and especially is this true when great dispatch is required. With a diver it would have required 125 days to complete the work as against nine days with the machine. This same machine without the bracket attachment cut off upwards of 2,000 piles for the north and south concrete revetment foundations at Superior Entry at a depth of 18 ft. below low-water datum and was then modified for the more accurate work on the cut foundations of the breakwater heads.

The machine was designed and built under the direction of Col. Graham D. Fitch, by the author and Mr. M. W. Lewis, U. S. Junior Engineer. With the exception of the vertical beam and shaft, with their accompanying devices, the machine is entirely made up of plant used for other purposes on the work; the boiler, engine, etc., being removed and used on other plant as soon as the purpose of cutting off piles has been accomplished.



Derrick for Excavating Sewer Trenches, Louisville, Ky.

An Efficient Derrick Used on Louisville, Ky., Sewer Work.

The accompanying illustration shows a derrick owned by the American Engineering & Construction Co. of Chicago and used on one of their sewer contracts at Louisville, Ky. The work was the construction of a large concrete sewer 14 ft. in diameter and 4,230 ft. in length. The depth of sewer averaged 39.3 ft., and the average number of cubic yards of excavation per lineal foot was 26.5. In the beginning of the work a steam shovel was used for the first cut but was abandoned as it was soon seen that the derrick could do the work required. The derrick took out the excavation to within 14 ft. of the bottom and the balance was taken out with a Potter machine and carried back for backfill. The derrick was equipped with an orange-peel bucket. The spoil material was deposited in wagons and was hauled away under a sub-contract at 11 cts. per cu. yd. The rest of the material excavated by the derrick was dumped into Koppel cars, located along side the trench and hauled directly to the backfill.

The derrick is a stiff leg, mounted on a portable turntable. The power plant consisting of a 30 h. p. boiler and a 7x10-in. engine operating three drums, is mounted on the turntable in such a position as to balance the weight of the derrick and boom. The drums are equipped with two sets of gears permitting arrangement for a dragline bucket, if desired. The entire outfit cost about $6,500. The output of the derrick was about 63,000 cu. yds. and averaged 1,500 cu. yds. per week. The maximum output in one day was about 850 cu. yds or 1,200 swings with the ¾ cu. yd. orange-peel bucket working in sand.

The derrick was formerly known as a Kearns derrick and the patents on the swinging arrangement are held by the Lidgerwood Manufacturing Co. We are indebted for the use of the drawing to Mr. Shaw, President of the American Engineering & Construction Co., Chicago, Ill.

Public Convenience Stations in Vienna.—The privilege of erecting, managing and operating all public comfort stations in Vienna was granted a single firm in 1883, the contract running until 1940. The company can prohibit the erection of stations by others within 1666 feet of its own.

There are 77 stations, 74 of which are above ground. These contain 564 water closets, of which 136 first class and 148 second class are for women, and 136 first class and 144 second class are for men. The first class water closets contain washstands. There are also 128 urinal stations for men built at a cost of $121 each. A charge of two cents for use of first class and 1 1-5 cents for second class closets is made. The city pays the firm a yearly subvention of $16 for each urinal in these stations.

The cost of building a station above ground is $3200 and of an underground station is $16,000. The cost of management and maintenance of a station above ground is about $600 a year and of an underground station is $1200 per year.

Norton Griffiths, M. P., of Griffiths & Co., the English concern, which, as noted in our last issue, received the contract for the construction of the new Chilian Ry., at $21,250,000, has sailed for Chili with a number of engineers and surveyors preparatory to starting actual construction work.

Comparative Economy of Steel I-Beams with Jack Arches vs. ReinforcedConcrete for Railroad Culverts and Short Span Solid Floor Bridges.

FRANK H. CARTER,* ASSOC. M. AM. SOC. C. E.

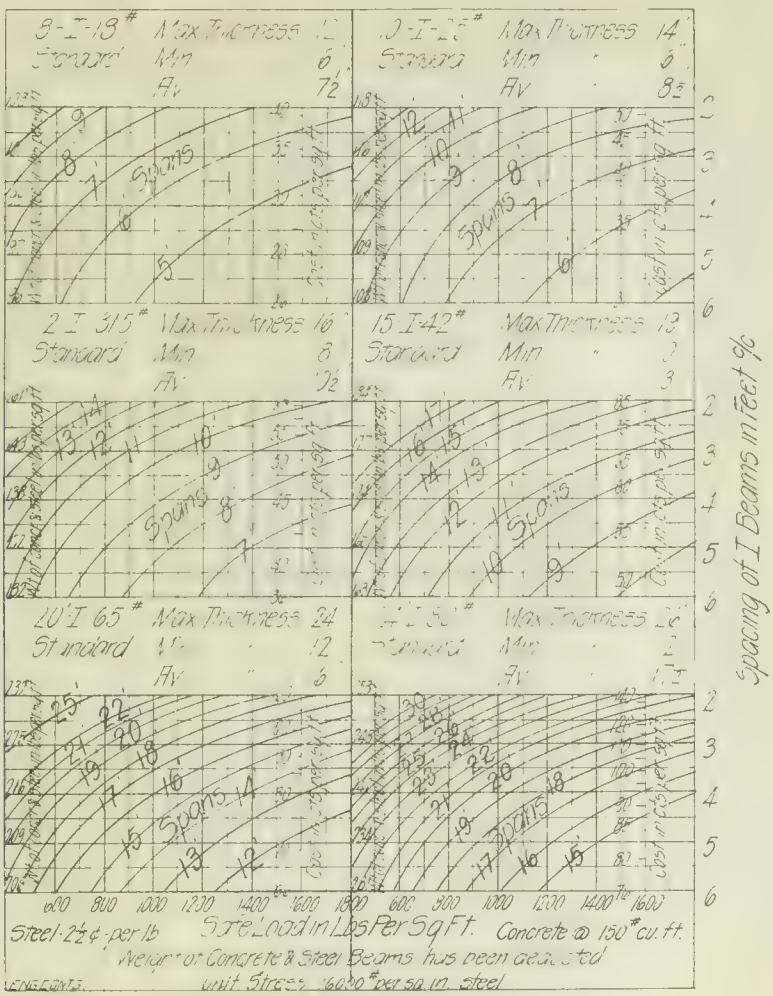
The design of a solid floor highway bridge, or the roof of a railroad culvert or other underground structure subject to heavy loads, furnishes interesting comparisons in selecting suitable and economical material for the roof. In choosing between steel I-beams with "jack arches," and reinforced concrete, there is little choice either way in respect to economy.

If the floor or roof is suspended above a swiftly running stream or it is difficult in any way to support centering from the bottom, or if the structure is subject to heavy loading very soon after construction, the choice lies with the steel beams and jack arches. If many structures are to be built of the same spacing as I-beams, then economy of design will probably point to the selection of the I-beams. If, however, the abutments or sidewalls can be built in such a manner with respect to forms as to enable the centering for the roof to be supported directly on the supports for the side wall forms, then economy will point to the selection of the reinforced concrete type of roof. A reinforced concrete roof will probably distribute concentrated live loads to far better advantage than the I-beam with jack arches, particularly if reinforced with steel rods longitudinally as well as laterally.

Costs per square foot of floor are given in Figs. 1 and 2, for both types of construction.

In computing the cost of I-beams with jack arch construction as given in Fig. 1, concrete including forms as estimated at $8 per cu. yd., and steel beams including punching for tie rods with the cost of tie rods, were estimated at 2½ cts. per pound of beam. The safe load in pounds per square foot was computed by first subtracting the weight of the roof itself. Otherwise the diagram is self explanatory.

In estimating the cost of the reinforced concrete roof, the concrete was estimated at $9 per cu. yd. and steel reinforcement at 3 cts per lb., reinforcement being computed in one direction only.



Spacing of I Beams in Feet
Steel 2½¢ per lb
Safe Load in Lbs Per Sq Ft.
Concrete @ 150# cu. ft.
Weight of Concrete & Steel Beams has been deducted
Unit Stress 16000# per sq. in. Steel

Fig. 1.

The cost of each type of construction per square foot is given in each case on a scale on the right hand side of the diagram.

The dead load was taken at 150 lbs. per cu. ft. for concrete, and 110 lbs. per cu. ft. for earth with a live load varying from 250 lbs. per sq. ft. for 15 ft. cover to 500 lbs. per sq. ft. for 2 ft. cover, to allow for impact and distribution of loads through the earth cover.

*Designing Engineer, Cambridge Main St. Subway, Boston Elevated Ry., Cambridge, Mass.

Method of "Spotting" Foundation Piles for a Bridge Pier.

The following method of "spotting" or locating piles in a bridge pier foundation is given by Mr. George A. McKay.* The work was on the foundations of a railway bridge across the Rio Grande, at Brownsville, Tex.:

In the location, or "spotting" of the piles, two lines were necessary, one parallel to the center line of the bridge, and the other at right angles to it. For lining in the piles parallel to the center line, a transit was used, set up on the bank over hubs spaced as per plans. To get the right-angled spacing, a location frame was established in the river about 100 ft. above the pier site. This frame was built on four temporary piles, so spaced as to form a square the size of the pier, or slightly larger. The piles were capped with timbers parallel to the bridge center line. A point was then located on each of these timbers by direct measurement with a 300-ft. tape. These points were directly up stream from the center of the pier where the piles were to be driven; and boat spikes, 6 in. long, were driven at the points and painted white. It was then an easy matter for a man on the barge to get on his centerline by moving his barge until these two spikes appeared in line to him, sighting between the driver leads. Other sets of spikes were also driven at equal distances from the first two, and spaced as the plans called for. The locating was thus done by only one man with an instrument. Each pile, when driven, was marked off on a chart.

LETTERS TO EDITORS.

Tests of Concrete Waterproofing Compounds for the Louisville, Ky., Sewer Work.

Sirs: In the issue of Engineering-Contracting of June 8, 1910, there appeared an article on tests of concrete for impermeability made by the Commissioners of Sewerage of the city of Louisville, Ky., to determine the impermeability of various waterproofing compounds.

I would respectfully invite your attention to the fact that our own product, Ceresit, was placed in a very damaging light in this article, inasmuch as the tests given show a rather low percentage and the logical conclusion of this was to discourage its use. This fact was further emphasized by the attention which was focused on the Louisville sewerage work. Furthermore, this article will be a strong weapon in the hands of competitors.

I would further invite your attention to the fact that in preparing our product for these tests, same was not done in conformance with the specifications which have been worked up by our chemist, as the proportion used was 1 part Ceresit to 20 parts of water, whereas our specifications are very definite that the proportion should be 1 to 12.

This hardly seems fair and we would think

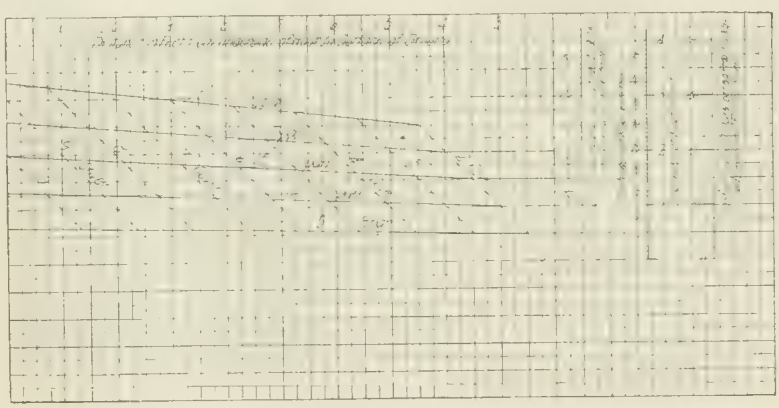


Fig. 2.

*Harvard Engineering Journal, May, 1910.

that a piece of concrete would certainly be condemned where the proper amount of cement was not used. In view of the fact, that parties who have not used our product, are unfamiliar with these specifications, the article in your columns is very misleading and likewise discouraging, and consequently we think we have received very unfair treatment by this article.

Trusting to your spirit of fairness and policy which have successfully marked your publication, we ask for a correction on this.

We are Very truly yours,

CERESIT WATERPROOFING CO.,

P. H. Hansen, Sec.

Personals.

Samuel Gardiner Adams, a well known bridge builder, died June 14 at Willimantic, Conn., aged 81 years.

Mr. H. C. T. Haultain has been appointed Professor of Mining at the University of Toronto, Toronto, Ont.

Mr. David R. Lyman, formerly Assistant City Engineer of Louisville, Ky., has been appointed City Engineer of that city.

Mr. W. D. Hines, Elkton, Md., has been appointed Roads Engineer of Cecil County, Maryland, succeeding the late Roger B. Irwin.

Mr. Samuel Whinery, Consulting Engineer, New York City, has been retained by the Commission on City Expenditures of the City of Chicago to examine into conditions and report upon improvements in the street department of Chicago.

Mr. John Duder, Assistant City Engineer of Salt Lake City, Utah, for the past four years, resigned from the city's staff June 1 to take the position of Chief Engineer in charge of the practice of the Birch Company, Engineers, of the same city.

Pete King, General Manager of Mason & Hauger, tunnel and railroad contractors, Cornwall-on-Hudson, N. Y., died June 19, at Loomis, N. Y., from tuberculosis. Mr. King had been in charge of much tunnel work in the southern and western states. He was buried at Louisville, Ky.

Theodore Lescher, an architect of Chicago, Ill., died June 14 in St. Luke's Hospital, New York, following an operation for appendicitis. Mr. Lescher assisted in drawing the plans for beautifying Washington and Chicago. He also drew plans for the new Field Museum in Chicago and was to have superintended its erection.

William H. Brown, formerly Chief Engineer of the Pennsylvania R. R., died suddenly June 25 at Belfast, Ireland, from heart failure. Mr. Brown in the civil war served under Col. Thomas A. Scott, who had charge of the military railroad forces, and as engineer of the United States military railroads in northern Virginia. He was made chief engineer of the Pennsylvania Railroad June 1, 1881, and was retired Feb. 28, 1906, on a pension.

The U. S. Civil Service Commission, Washington, D. C., will hold an examination on July 27, 1910, to secure eligibles from which to make certification to fill a vacancy in the position of engineer in timber tests, $1,200 per annum, Forest Service, Madison, Wis., and vacancies requiring similar qualifications as they may occur, unless it shall be decided in the interest of the service to fill the vacancy by reinstatement, transfer or promotion.

The U. S. Civil Service Commission, Washington, D. C., will hold an examination July 27-28, 1910, to secure eligibles from which to make certification to fill a vacancy in the position of topographic draftsman (male), Coast and Geodetic Survey, Washington, D. C., $900 per annum, and vacancies requiring similar qualifications as they may occur in any branch of the service, unless it shall be decided in the interest of the service to fill the vacancy by reinstatement, transfer or promotion. The salary of the position of topographic draftsman ranges usually from $1,000 to $1,500 per annum, and for copyist topographic draftsman from $900 to $1,500 per annum. Both men and women will be admitted to this examination.

The U. S. Civil Service Commission, Washington, D. C., will hold an examination on July 27-28, 1910, to secure eligibles from which to make certification to fill a vacancy in the position of forest engineer, $1,800 per annum, in the Forest Service, and vacancies requiring similar qualifications as they may occur, unless it shall be decided in the interest of the service to fill the vacancy by reinstatement, transfer or promotion. Applicants must have had at least five years' good experience in civil engineering work. Graduation in civil engineering from any reputable technical school will be considered equivalent to three and one-half years of this period. They must also have had at least two years' actual experience in forestry work, either as civil engineers in connection with forestry or as practical foresters. The experience in forestry may be concurrent with the experience in civil engineering.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Port Huron Engine and Thresher Company.—Paper, 12x9 ins., 80 pp. Port Huron, Mich.

This is the general catalog for 1910 and is quite complete with cuts of detailed parts, descriptions, reasons for design and on the whole is a valuable catalog for a careful buyer of this class of machinery.

Old Faithful.—Paper, 6x9 ins., 24 pp. Weber Subterranean Pump Co., 90 West St., New York.

A careful explanation of the principles involved in subterranean pumping in regard to the uses of pumps of the positive displacement type, in which compressed air acts as a piston on the upper surface of a liquid depressing it to a given level and discharging it through a vertical outlet pipe located in the water chamber or intake cylinder.

J. M. Fibre Conduit.—Paper, 3½x6 ins., 12 pp. H. W. Johns-Manville Co., 100 William street, New York.

An illustrated booklet about the molded asbestos fibre conduit with price lists.

The Emerson Steam Pump.—Paper, 6½x9½ ins., 52 pp. J. Jacob Shannon & Co., 1744 Market street, Philadelphia, Pa.

This is a very complete catalog illustrating and describing the Emerson pump, its simplicity and economical features, and giving information as to how to install and operate them. Tables of prices, sizes and other valuable data are given.

"Morris" Centrifugal Pumps.—Paper, 9x6 ins., 96 pp. J. Jacob Shannon & Co., 1744 Market street, Philadelphia.

This is an excellent catalog covering all services to which centrifugal pumps can be applied; with illustrations of pumps and accessory machinery and price lists.

American Power Pumps and Compressors.—Paper, 6⅜x7½ ins., 16 pp. **American Pumping Machinery.**—Paper, 6⅜x7½ ins., 24 pp. J. Jacob Shannon & Co., 1744 Market street, Philadelphia, Pa.

These pamphlets illustrate types and sizes of American simple and compound steam pumps, geared power pumps and compressors.

Carpenters' and Mechanics' Tools.—Paper, 6x9 ins. J. Jacob Shannon & Co., 1744 Market street, Philadelphia, Pa.

An illustrated hardware catalog with especial reference to the tools in use by carpenters and mechanics.

Contractors' Supplies.—Cloth, 7¼x10¼ ins., 614 pages. J. Jacob Shannon & Co., 1744 Market street, Philadelphia, Pa.

This is the general catalog of the company. It is the result of an endeavor to illustrate and describe the best types of plant, tools, supplies and general equipment most desirable for the requirements of railroads, industrial establishments, contractors and builders. It contains "everything for the contractor."

Rock Drills.—Paper 6x9¼ ins.; 30 pp. Wood Drill Works, 30-36. Dale Avenue, Paterson, N. J.

This catalog deals with the Wood Rock Drill and drill mountings, and is quite complete with descriptions and illustrations of all sizes and parts of drills, operated by steam and compressed air. The catalog shows diagrams, which indicate the different drill parts by letters, for convenience in ordering. A line of blacksmiths' tools for forging and sharpening drill steels is also given. A portion of the book is devoted to advice about the handling and setting up of this kind of machinery. Tables of sizes, and of our pressures necessary for different conditions, are given.

Silicate Brick Machinery.—Paper 8¾x11¼ ins.; 50 pp. Wiebe Engineering Co., 170 Broadway, N. Y.

This catalog embodies a complete description of the process of manufacturing perfect sand-lime brick. The process is well illustrated, showing all the machinery involved and containing a large amount of special machinery for the performance of particular functions of the process.

Contractors' Supplies.—Paper 8¾x11¾ ins. 44 pp. Contractors' Supply & Equipment Co., Denver, Colo.

This is a general catalog containing illustrations, descriptions and prices of everything in the line of contractors' machinery, tools and supplies.

Aggregate.—Paper 6x9 ins.; 12 pp. Edison Portland Cement Co., New Village, N. Y.

Being a series of illustrations of garages and property improvements which are examples of the use of Edison Portland Cement.

All About Roofing.—Paper 5⅝x8½ ins.; 18 pp. The standard Paint Co., 100 William St., New York City.

Containing descriptions and illustrations and results of tests as to the uses of Ruberoid roofing.

Paints.—Paper 5x6¾ ins.; 24 pp. The Standard Paint Co., 100 William St., New York City.

This pamphlet devotes a page or more to each of the different kinds of paints manufactured, giving the composition, characteristic properties, uses and method of application of each. This company also puts out a dozen or more small cards and leaflets describing various products.

Boilers.—Paper 4x8¾ ins.; 16 pp. The Pressed Radiator Co., Pittsburg, Pa.

A booklet giving illustrations and complete descriptions and tables concerning the Presto Boilers, which are now being built to operate with Kinnear Pressed Radiators, Blowers and Gas Exhausters. Paper 6x9 ins.; 20 pp.

Highway Culvert Pipe.—Paper 4x6 ins.; 8 pp. Penn Metal Ceiling & Roofing Co., Ltd., 201 Devonshire St., Boston, Mass.

A folder illustrating the uses of and describing this type of culvert pipe.

American Air Compressors.—Paper 7¾x10½ ins.; 80 pp. The American Well Works, First National Bank Bldg., Chicago.

A complete catalog showing the "American" type of air compressors. It goes thoroughly into details and gives tables of data relating to air compression. Root Spiral Riveted Pipe; paper 4¾x7⅜ ins.; 108 pp.

Abendroth & Root Mfg Co.—New York; Chicago office, First National Bank Big. B. M. Osbun Co., Selling Agents

A handsome book for use in connection with the spiral riveted pipe. contains descriptions, illustrations, tables, prices and useful information.

American Locomotives.—Paper 8¼x10¾ ins.; 10 pp. American Locomotive Co., New York City.

Being a bulletin of the company, No. 1004. A description of a new freight locomotive—articulated type—with illustrations and drawings.

Contract News Section

of

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The Canadian Government through the Department of Railways and Canals is calling for bids for constructing the new Quebec bridge. The work is being extensively advertised in Germany and England and it is expected that several foreign firms will bid on the work. The bids are to be opened Sept. 1. Each bidder is required to submit a guarantee bond of $1,000,000.—The oyening of the Tieton irrigation canal of the U. S. Reclamation Service was formally celebrated last week at North Yakima. The canal reclaims 35,000 acres of semi-arid land, and has cost $1,800,000.—A decision to construct the proposed new $25,000,000 terminal of the Pennsylvania R. R. between Canal St. and the Chicago River and from Madison St. south to Van Buren St. at Chicago has been reached by the management and concurred in by the directors of the St. Paul. the Alton and the Burlington roads, which will occupy the costly station jointly.—The Board of Public Improvements of St. Louis, on June 22, awarded the conrtact for the construction of the Kings Highway Viaduct to Wm. P. Carmichael Co., St. Louis, Mo., at about $336,000. The structure will be wholly of reinforced concrete and will be 90 ft. wide and 1,850 ft. long.—Another large piece of bridge work which was let last week was the contract for the construction of the substructure of a bridge to be built across the Ohio River at Louisville, Ky., for the Kentucky & Indiana Bridge & Railroad Co. The work calls for eight piers, six of which will be in the river, and requires about 25,000 cu. yds. of concrete. Foster-Creighton-Gould Co., Nashville, Tenn., secured the contract.—The stockholders of the Lehigh Valley R. R. have voted to increase the capital stock from $40,334,800 to $80,000,000. The directors were empowered to issue and dispsoe of as many of the additional shares as they think necessary for paying the debts of the company, constructing and completing the railroad and to construct branches not exceeding 12 miles in length.—The chief feature of railroad construction work of the past week was the opening of bids at Denver, Colo., by the Denver & Rio Grande and the Colorado & Southern for the construction of double track from Pueblo to Walsenburg, a distance of 50 miles. The work includes 6,000,000 cu. yds. of embankment. A large number of contractors figured on the work.—Among the railroad construction contracts let recently are the following: Sharp-Hauser Constructing Co., Los Angeles, Cal., for about 1,700 ft. of concrete work near Keenbrook, Cal., for the Santa Fe., the work amounting to about $35,000; M. C. Connors & Co., Chicago, Ill., for grading for six miles of interurban line from Palmyra, Mo.; Murch Bros. Construction Co., St. Louis, Mo., at about $500,000 for constructing the Union depot at Memphis, Tenn.; Roach & Stansell, Memphis, Tenn., for 25 miles of grading work on the Kansas City, Mexico & Orient R. R. from Del Rio, Tex., north; J. P. Mullarkey, Montreal, Que., for constructing the line of the Canadian Northern Ry., from Hawkesbury to Montreal, Que.; Kneal & Ryan, Lansing, Mich., for constructing an electric railway from Grand Ledge, Mich., to Lansing; McIntosh Bros., Milwaukee, Wis., for constructing the proposed railroad from White Sulphur Springs to Dorsey, Mont.; W. O. Lipscomb, Roanoke, Va., for the construction of a coal carrying railroad in Kanawha County, W. Va., for the Campbell Creek Railway & Coal Co.; Ransom & Cook, Ottawa, Kan., for the earthwork and excavation for the Atchison, Topeka & Santa Fe's $76,000 reservoir to be constructed north of Chanute, Kan.; Foley, Welch & Stewart, for constructing 25 miles of the Kootenay Central Ry., in Canada, a subsidary line of the Canadian Pacific Ry.

The Panama Railroad.

It is not generally known that the Panama R. R. outranks in age many of the railroads of this country. But such is the case, for on Jan. 28, 1855, an engine passed over this road from ocean to ocean. In the Journal of the Western Society of Engineers Mr. Joseph E. Murphy gives an interesting historical sketch of this railroad and from his paper we have taken the notes that follow. The earliest reconnaissance of the Isthmus for the purpose of finding a railroad route was made in 1835 by Charles Biddle, who had been commissioned by the U. S. Government to examine the different routes for inter-oceanic communication and report on their value. He returned to the United States in 1837, having obtained a decree from the Government of New Granada authorizing the building of a railroad across the Isthmus of Panama. Nothing further was done until 1848 when John L. Stephens, accompanied by J. L. Baldwin, a civil engineer, made an exploration of the proposed route and found it entirely practicable. A company was then formed in the State of New York with a capital stock of $1,000,000, and in 1849 a detailed survey was undertaken under the direction of Col. G. W. Hughes of the U. S. Topographical Corps. A contract for the construction of the road was let in 1849 to George M. Totten and John C. Trautwine, both of whom had had previous experience in construction in the tropics. The terms of the contract were based on the assumption that labor on the Isthmus was cheap and easy to secure. This, however, was not the case, and Messrs. Totten and Trautwine were released from the contract but were retained as engineers. The city of Panama was the only logical terminus for the Pacific end, and after much exploration it was decided to locate the Atlantic terminus on the Island of Manzanilla, in Navy Bay. It was planned to build first from Gorgona to Panama and operate this portion of the line in connection with steamboats plying between Chagres and Gorgona. In Harper's New Monthly Magazine for January, 1859, the "breaking ground" by John C. Trautwine and J. L. Baldwin is thus described: "Two American citizens, leaping, axe in hand, from a native canoe upon a wild and desolate island, their retinue consisting of half a dozen Indians, who clear the path with rude knives, strike their glittering axes into the nearest tree; the rapid blows reverberate from shore to shore, and the stately cocoa crashes upon the beach. Thus unostentatiously was announced the commencement of a railway, which from the interests and difficulties involved, might well be looked upon as one of the grandest and boldest enterprises ever attempted." In the month of August, 1850, actual construction was begun from the Atlantic terminus toward Gatun. At about the same time supplies and machinery were received from the United States and taken to Gatun, the Chagres being navigable to that point. Construction was begun across the swamps to meet the work already in progress at the Atlantic terminus. The work was constantly hampered, and at times practically brought to a standstill, by sickness and by the desertion of large numbers of workmen to take service in the Transit, where better wages and an easier life were offered. It was necessary to bring in recruits constantly, mainly from Carthagena and Jamaica. On the first day of October, 1851, a work train passed over the road as far as Gatun. In January, 1854, the road was completed to the summit ridge at Culebra. At this time an additional force started construction north from Panama to meet the advancing work from Culebra. On the night of January 27, 1855, the two lines met, and at last the Panama Railroad was an accomplished feat. On the following day an engine passed from ocean to ocean. In the month of January, 1859, the construction account was closed, the total cost of the road to that date being $8,000,000.

The River and Harbor Bill.

President Taft has at last given his approval to the Rivers and Harbors Bill, not because he likes it, but because he thinks the failure of the bill thus late in the session would seriously embarrass the constructing engineers. In a message to Congress he points out what he considers to be defects in the bill and makes recommendations for the preparation of future bills. The chief defect that he finds in the present bill is the large number of projects appropriated for and the uneconomical method of carrying on these projects by the appropriation of sums small in comparison to the amounts required to effect completion. He points out that the appropriation of a small sum for a doubtful enterprise is thereafter used by its advocates to secure further sums from Congress on the ground that the investment made is a conclusive recognition of the wisdom of the project, and its continuance becomes a necessity to save the money already spent. The proper policy, according to the message, is to determine from the many projects proposed and recommended, what are the most important and then to proceed to complete them with due dispatch and then take up others and do the same thing with them. The present River and Harbor Bill carries an appropriation of some $52,000,000 and provides for many important pieces of work. It provides for the canalization of the Ohio River, to be prosecuted at a rate which will insure its completion within 12 years; the improvement of the Mississippi River between Cairo and the Gulf of Mexico, to be completed within 20 years; and of the Mississippi River between the mouth of the Missouri and the mouth of the Ohio River, to be completed within 12 years. It also provides for the improvement of the Mississippi River between Minneapolis and the mouth of the Missouri River, to be completed within 12 years; of the Hudson River for the purpose of facilitating the use of the barge canal in the vicinity of Troy, N. Y.; of the Savannah River from Augusta to the sea, with a view to its completion within four years; of a 35-ft. channel in the Delaware River from Philadelphia to the sea; of a 35-ft. channel to Norfolk, Va.; of a 27-ft. channel to Mobile, Ala.; of a 30-ft. channel to Jacksonville, Fla.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ALABAMA.

The Tuscaloosa Mineral R. R. has completed surveys for its projected 18-mile line from Tuscaloosa, Ala., to Brookwood, Ala., and contracts for the work will probably be let to the Tuscaloosa Contracting Co., of Tuscaloosa. F. G. Blair, Tuscaloosa, Ala., is President of the railroad, and Woolsey Finnell, Tuscaloosa, is Chief Engineer.

The Decatur & Falls City Development Co. is now making surveys and has partly secured the capital for the construction of its projected 50-mile railway from Decatur to Falls City, Ala., through Morgan, Lawrence, and Winston counties. E. J. Wind, New Decatur, Ala., is chief engineer, and E. H. Allison, New Decatur, is president. D. W. Day, Hartselle, Ala., is also interested.

CALIFORNIA.

The Highland Pacific R. R. Co. has completed surveys and has in part secured the capital for the construction of its projected line. Construction contracts are to be let soon. The projected length of this road is 70 miles, and it is to extend from Santa Rosa to Upper Lake and Kelseyville, via Highland Springs and Lakeport. Dr. A. E. Dickinson, Ukiah, Cal., is president.

IOWA.

The Iowa City, Ottumwa & Southwestern Ry. Co. is planning to let construction contracts this fall. The company projects a 70-mile line, and has secured $240,000 of capital for construction purposes. Frank Tanner, Iowa City, is vice-president and general manager.

KANSAS.

The Motor Grand Traction Co. has completed surveys for 65 miles of its projected line and has secured about $100,000 for construction purposes. Construction contracts are to be let soon. The projected length of this road is 165 miles and the route is from Chester, Neb., to Wichita, Kan., via Concordia, Salina and Newton. Jno. E. Daugherty, Wichita, Kan., is Chief Engineer; E. S. Alnutt, Canton, Kan., is President, and H. G. Knickerbocker, Canton, Kan., is General Superintendent.

The Oklahoma-Kansas Ry. Co. has completed surveys and has negotiations underway for securing the capital for the construction of its projected line. The projected length is 35 miles and the route is from Galena to Riverton, from Riverton to Columbus, and Riverton to Miami, Okla., via Baxter. W. K. Palmer, Kansas City, Mo., is Chief Engineer; C. M. Jones, Baxter Springs, Kan., is President, and Chas. L. Smith, Baxter Springs, Kan., is Treasurer.

MONTANA.

The city of Billings, Mont., at a special election June 20, granted the Eastern Montana Electric Ry. Co., a 50-year franchise. F. A. Kesselluth, Billings, Mont., is chief engineer.

NEW YORK.

We are advised that the Auburn & Syracuse Electric R. R. Co. has no present intention to construct a cut-off from Auburn to Skaneateles. T. H. Mather, Syracuse, N. Y., is chief engineer.

OHIO.

The Massillon & Brewster Air Line R. R. Co. has made preliminary surveys for its projected 6½-mile line from Massillon to Brewster. The capital for construction has not been secured as yet and no date has been set for awarding construction contracts. J. G. Wise, Massillon, O., is President.

TEXAS.

The contract will be let early in July for the construction of the projected line of the Crosbyton-South Plains R. R. Co. As projected, this line will be 120 miles long. It is to extend from Crosbyton to Lubbock. Prentiss L. Coonley, 39th street and Stewart avenue, Chicago, Ill., is president.

Grading has been practically completed for the projected line of the Crystal City & Gardendale R. R. The projected length of this road is 41 miles and it is to extend from Crystal City, Tex., east to Gardendale, Tex. The construction capital has been received. E. Breaker, Crystal City, Tex., is Chief Engineer; J. E. Franklin, St. Louis, Mo., is President, and A. R. Ponder, Crystal City, Tex., is General Manager.

Power Developments, Levees, Drainage and Irrigation Works.

FLORIDA.

Henry Monk, Pensacola, Fla., was low bidder June 15, for extending the wharf at Fort Pensacola for the U. S. Quartermaster.

ILLINOIS.

The following bids were received June 20 by C. L. Webster, county surveyor, Wheaton, for the cleaning out of South Side drainage ditch: McAllister & Peterson, Zion City, Ill., $2,550; A. Bennema, 303 West 111th place, Chicago, $3,850; American Engineering & Construction Co., Chicago, $4,440; Stephens Construction Co., Chicago, $4,649; Joseph Lewis, Attwood, Ill., $4,950; Horton & Mosely, Fort Wayne, Ill., $7,500.

The estimate of this work was $3,500; approximate amount 12,000 cu. yds.

INDIANA.

The following bids were received June 20, by Major Thos. H. Rees, U. S. Engineer, Chicago, Ill., for construction of concrete superstructure, steel sheeting, etc., at Michigan Harbor, Ind.: (1) Standing for the bid of the Fitzsimmons & Connell Co., Chicago, Ill. (recommended for acceptance), and (2) for the Great Lakes Dredge & Dock Co., Chicago, Ill.:

	(1)	(2)
Preparing foundation for concrete superstructure, per lin. ft., 100 lin. ft.	$ 5.00	$ 6.00
White oak plank, per M. ft., 700 ft. B. M.	80.00	65.00
Pine timber, per M. ft. B. M., 3,300 ft. B. M.	70.00	60.00
White oak piles, 50', each, 26 only	20.00	25.00
Interlocking steel sheeting, per lin. ft., 750 lin. ft.	22.00	30.00
Steel screw bolts and tie rods, per lb., 3,580 lbs.	.05	.06
Steel drift bolts and mooring bolts, per lb., 420 lbs.	.05	.05
Steel staples, per 100, 1½ C.	5.00	3.00
Wrought iron spikes, per lb., 500 lbs.	.04	.04
Wire rope, per lin. ft., 360 lin. ft.	.05	.15
Riprap stone, per cord of 128 cu. ft., 65 cords	12.00	10.00
Spall or gravel filling, per cu. yd., 150 cu. yds.	2.00	2.00
Concrete in mass, per cu. yd., 660 cu. yds.	12.00	10.50
Use of dredge with outfit complete, per hour, 20 hours	25.00	25.00
Total	$16,492	$17,637

IOWA.

O. P. Herrick, Observatory Bldg., Des Moines, Ia., has been awarded the contract for constructing a drainage ditch for Polk County Drainage District No. 11, in Elkhart township. The contract requires the moving of 53,471 cu. yds. of earth. Bids were opened June 20 at Des Moines, Ia.

KENTUCKY.

Foster, Creighton, Gould Co.; Nashville, Tenn., has been awarded contract for the sub-structure of bridge to be built across the Ohio river at Louisville, Ky., by the Kentucky & Indiana Bridge & Railroad Co. The work consists of eight piers, six of which will be in the river and will require approximately 25,000 cu. yds. of concrete.

LOUISIANA.

Richard M. Murphy, New Orleans, La., was the low bidder, June 24, for furnishing willows from July 1 to June 30, 1911, at South or South West Pass, Mississippi River, for the U. S. Engineers.

The City of New Orleans, La., proposes to create a park on the shore of Lake Pontchartrain at the rear of the city. This work will consist of a reinforced concrete sea wall and the filling in of the lake bed between the sea wall and the shore. The sea wall will be placed about 500 ft. from the shore line at a point where the water is about 30 ins. deep and the daily tidal oscillation about 6 ins. The wall will be approximately 2,600 ft. long and 14 ft. high. The embankment will be about 2,200 ft. long by 500 ft. in width and from 8 to 10 ft. in height and will embrace approximately 400,000 cu. yds of earth to be obtained by dredging in the lake bed outside of the sea wall. Plans and specifications for this work are now being prepared by the City Engineer's department and it is expected that the city will advertise for bids in about 40 days. W. J. Hardee is City Engineer; Thos. L. Willis is Principal Assistant Engineer.

MINNESOTA.

G. E. Brown, Windom, Minn., has been awarded the contract for constructing County Ditch No. 18 at Caribou, Minn. The work includes 85,445 cu. yds. of ditch work and the contract price was 12 cts. per cu. yd. Bids were opened June 20 at Hallock, Minn.

Bids are asked by C. J. Hemmingson, Auditor of Kitson County, Hallock, Minn., until 1 p. m., July 9, for constructing Judicial Ditch No. 10, requiring 381,508 cu. yds. of excavation of main ditches and branches. The estimated cost is $62,957.

MISSISSIPPI.

Bids are asked by R. H. Hicks, City Clerk, of Greenwood, Miss., until 8 p. m., July 5, for installing a drainage system, the work including 22 acres of clearing, 14,800 lin. ft. of main canal, 3,800 lin. ft. of lateral canal containing 75,000 cu. yds. of excavation, 3,000 ft. of 36-in. by 39-in. and 26-in. by 28-in. reinforced concrete conduit, etc.

OHIO.

Bids are asked by James R. Marker, Chief Engineer State Board Public Works, Columbus, O., until noon, July 13, for the building of Lock No. 1 at New Bremen, and the superstructure of the aqueduct crossing Loramie Creek, near the village of Loramie.

G. H. Breyman & Bro., Toledo, O., have been awarded the contract at $16,750, for dredging Black River for the city of Lorain. The work includes 100,000 cu. yds. of dredging and reclaming swamp land by filling in with mud excavated from the river, the latter work requiring about 15,000 cu. yds. Bids were opened Jan. 21. The contract price for the dredging was 11 cts. per cu. yd.; the contract price for the fill was 35 cts. per cu. yd.

RHODE ISLAND.

Following bids were received June 23 at the U. S. Engineer's office, Newport, R. I., for repairing breakwater at Sakonnet Harbor, R. I., (1) standing for bid per ton of 2,000 lbs.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

(Confirmed Reports Continued.)

for furnishing and placing 1,500 ins. of stone, (2) for bid for furnishing lighter, and (3) for total: J. C. Terry, Fall River, Mass., (1) $4, (2) $5 per hr., (3) $6,600; E. S. Belden & Sons, Hartford, Conn., (1) $1.63, (2) $6 per hr., (3) $3,165; The Breakwater Co., Philadelphia, (1) $2.43, (2) $50 per day of 8 hrs., (3) $4.395; U. S. Drainage & Irrigation Co., New York City, (1) $3.77, (2) $7 per hr., (3) $6,495; The Estate of John Beattie, Leetes Island, Conn., (1) $1.65, (2) $7 per hr., (3) $3,315.

TENNESSEE.

Contracts for work in the Reelfoot and White River levee districts, bids for which were opened June 15, by Major M. L. Walker, U. S. Engineer, at Memphis, have been let as follows: W. S. Mosby, Memphis, Tenn., 60,000 cu. yds. of enlargement in the Reelfoot District, at 23.7 cts. per cu. yd.; Roach & Stansell, Memphis, at 15.8 cts. per cu. yd., for 100,000 cu. yds. of enlargement in White River Levee District.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Hot Springs Street Ry. Co., H. E. Martin, General Manager, Hot Springs, has applied to the City Council for a franchise for an extension of its car line in South Hot Springs.

The Prescott & Northwestern Ry., W. N. Bemis, President, Prescott, Ark., is now in operation to Helbig, Pike county, and will at once be extended in a northwestern direction to a connection with the Mena and Eastern which will give Mena an eastern outlet.

Advices from Greenwood, Ark., state that work on the Gurdon link of the Fort Smith and Gurdon Ry. will be commenced at once.

The construction gang on the Central Arkansas & Eastern, including about 100 men and 60 teams, are about to start work on the proposed 30 mile line from Stuttgart to England, Ark. After the completion of the main line it is reported that an extension will be built. As noted before in these columns, John Scott & Sons, St. Louis, Mo., are the contractors. The railway company recently filed a certificate with the secretary of state showing an increase of capital stock from $880,000 to $1,100,000 to provide funds for the new work.

Upon the application of the Commonwealth Trust Co., St. Louis, Mo., Judge John H. Rogers appointed William Fordyce of St. Louis receiver for the Dardanelle, Ola & Southern Ry. The road is regarded as a possible link of the trunk line which is expected to be formed some time by the consolidation of a large number of short roads between Fort Smith, Ark., and Little Rock. A great many of the stockholders of the road are located at St. Louis.

The Cache Valley R. R. is said to be planning to extend its line to Paragould. The road at present is 12 miles long and connects with the Frisco at Sedgewich. The extension would add 18 miles. G. W. L. Brown, Sedgewich, Ark., is General Manager.

The Memphis, Paris & Gulf R. R. is said to be about to start the permanent survey for the eastern extension from Murfreesboro to Memphis. The road will run from Murfreesboro to Arkadelphia, Pine Bluff, Dewitt, St. Charles, Helena and Memphis. The route is now definitely settled, the only work now remaining for the engineers being the permanent survey. C. W. Dodson, Nashville, Ark., is General Superintendent.

According to an announcement made by Will Bemis, director of the Prescott & Northwestern R. R. at Little Rock, Ark., work is to be started at once for the proposed extension of the line from Helbig, Pike County, northwest to a connection with the Mena & Eastern, thus giving Mena a connection with the Iron Mountain and opening up one of the best fruit sections in the state.

Hodges & Downey, contractors of Dermott, Ark., have established headquarters preparatory to starting work on their contract for ballasting the entire Valley line of the St. Louis, Iron Mountain & Southern Ry.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Sharp-Hauser Contracting Co., Los Angeles, have the contract for about 1,700 ft. of concrete work near Keenbrook for the Atchison, Topeka & Santa Fe Ry. The work will cost about $35,000.

Preliminary surveys have been started for the new channel of the Santa Ana river. This work is to be done for the Newbert Protection District of Santa Ana, which plans to dike the river, beginning at a point above where Santiaga creek empties in order to control the winter storm waters. This survey is necessary because the first one made was for a 600-ft. channel. Since that time the width has been changed to 400 ft.

The City Council of Oakland has been considering the application of the San Francisco, Oakland & San Jose Ry. Co. (Key Route), Oakland, for a franchise for a 1,000 ft. fairway extending from the low tide line to the government bulkhead line with the privilege of constructing wharves, docks, railway terminals, warehouses and other facilities. The Key Route also wants the privilege of maintaining a single or double track street railway along the extension of 14th St. to the low tide line. In exchange, the company offers to settle the low tide controversy which has been in course of litigation for half a century, and to join in the petition of the city to the federal authorities for permission to extend the bulkhead line 2,000 ft. into the bay, thus giving the city 206 acres of made land.

The North Pasadena Land & Water Co., of Pasadena, is planning to construct a 15,000,000 gallon reservoir in Altadena.

The Western Pacific Ry. has work under way preparing the site for the construction of its shops at Sacramento. They will cost about $1,000,000 and will be used as a general repair establishment for that part of the system between the coast and Salt Lake City. The work of the construction of the shops will be under the supervision of Division Engineer W. J. Calvin.

An agreement has been made by George S. Oliver, Chief Engineer of the Nevada, California-Oregon R. R., and W. Thompson, attorney of the Oregon Land Company, Lakeview, Ore., for right of way through the XL ranch on Pitt River for the proposed line into Goose Lake Valley. Under the present plans the line will be extended from Alturas, Modoc County, the present terminus, into Goose Lake Valley this summer and into Lakeview, Ore., by 1911. The contract for the construction work will be let at once and pushed as rapidly as possible.

Southern Pacific surveyors are located at Redding, Cal., and are making surveys for the construction of the proposed line to Harrison Gulch.

The Central Pacific Ry. Co. has filed an application with the City Council of Oakland, Cal., for a franchise to run a line from Melrose eastward to Stanley Road, a distance of two miles.

Advices from Willows, Cal., state that the Southern Pacific Co. will soon begin construction of the branch road to Arbuckle upon the old survey made some time ago.

The Riverside Portland Cement Co. of Riverside, Cal., is extending the Crescent Ry. line from the plant northward to Bloomington on the Southern Pacific. Rights of way are also being secured for the further extension to Rialto. The road will be operated by trolley.

The Southern Pacific Co. has applied to the City Council of Oakland for a franchise from Melrose station, in the annexed district, easterly to the Stanley road, which is the eastern boundary line of the city.

The request of the railroad company for this franchise is in line with the plans of improvement and will provide for the extension of the local system to the farthest eastern point in the city.

Advices from Escondido state that the Mutual Water company has secured the services of Lewis Hosp, Jr., as engineer to take charge of the construction of the flume line at the upper end of the system. The enterprise calls for an expenditure of about $12,000 and the work will be done by day labor.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Bids were opened at Denver on June 20 by the Denver & Rio Grande R. R. and the Colorado & Southern Ry., for the construction of a double track from Pueblo to Walsenburg, a distance of 50 miles. The work includes 6,000,000 cu. yds. of embankment. The section between Walsenburg and Huerfano must be completed by Nov. 1, 1910. This stretch includes 1,600,000 yds. of embankment. The track will be a 34 ft. crown on the embankment and 30 ft. through the cuts. The grade will be 1 per cent maximum. The heaviest cut will be 65 ft. and the heaviest fill will be 100 ft. Among the contractors figuring on the work were MacArthur Brothers Co. of New York and Chicago, Kennefick, Quigley & Hoffman of Kansas City, Utah Construction Co. of Salt Lake, Phillips & O'Gara of Denver and Orman & Crook of Pueblo.

Knowles, Ellsworth & Klaner, Salt Lake City, Utah, are reported to have been awarded the contract for constructing a dam in the upper Rio Grande River for the San Luis Valley Irrigation District. The contract price is said to be $230,000.

C. C. Sullivan, Pueblo, has been awarded the contract for the excavation work for the Daniels & Fisher store to be erected at 16th and Arapahoe Sts., Denver.

The interests owning the Denver Tramway Co., Denver, have acquired control of the Denver & Intermountain R. R., which operates for a distance of 17 miles between Denver and Golden. It is planned to spend about $150,000 in improving the road and in providing new equipment. The following officers have been chosen: William G. Smith, president, to succeed Charles F. Propst; F. L. Butler, vice president and general manager; Frederick G. Moffat, treasurer, and James H. Brown, secretary.

The Union Pacific construction forces have work under way surfacing the tracks between LaSalle, Colo., and Sand Creek on the new branch line, which, when completed with the main line, will give the company a double track line between Denver and LaSalle.

Surveyors of the Laramie, Hahn's Peak & Pacific Railway have been at work for some time in the vicinity of Pearl, Colo., and it is reported that the company intends the extension of its Laramie-Centennial line to Pearl and thence into the rich coal and gold fields near there. J. J. Argo, Laramie, Wyo., is Chief Engineer.

The Colorado Springs Electric Co., the Pikes Peak Hydro Electric Co. and the Colorado Springs Light & Power Co., operating in Colorado Springs, Colorado City and Manitou, have been merged under the name of the Colorado Springs Light, Heat & Pow-

er Co., with a capital stock of $2,000,000. George Bullock and associates of New York controlled the old companies and will be supreme in the management of the new concern. George B. Tripp will continue as general manager. J. C. Lawler, the electrical engineer, will be transferred to a Bullock company at Richmond, Ind.

A bill is before the Board of Aldermen of Denver providing for the creation of a terminal commission, to serve without pay and to take complete charge of the plans on the part of the city for having a new union depot erected in Denver. The plan for the commission contemplates that it shall be composed of eight members, two to be chosen by the mayor independently of any commercial organization, and the other six to be selected from the commercial bodies, two each from the Real Estate exchange, chamber of commerce and Manufacturers' association.

Connecticut Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Connecticut Co., New Haven, Conn., has petitioned the town of North Haven for the right to double track its trolley line in Whitney Ave. from a point near the Web shop in Augurville to the present terminus of the double tracks near the second bridge at Lake Whitney.

Construction work is to be started on the projetced line of the Bridgeport & Danbury Ry. Co. as soon as a certificate of necessary and convenience is secured. A charter was granted by the last legislature and court proceedings to secure the certificate are now under way. A. William Sperry, 82 Church St., New Haven, Conn., is Engineer.

Florida Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Swann & Holtsinger of Tampa, Fla., owners of dock front property adjoining the Seaboard Air Line right-of-way across the Seddon Island, the latter's terminals at Tampa, have engineers engaged in drawing plans for a 500-ft. channel extension of the dredged channel from the Seaboard's space, This 500-ft extension will be occupied by modern docks, warehouses, etc., which this company will build. The work will necessitate the Seaboard's dredging its right-of-way which crosses the channel at its lift bridge.

Capitalists of Pensacola, Fla., are dealing with one of the large syndicates of Baltimore, Md., with the prospects that a deal will be closed by which a railroad will be constructed between Andalusia and Pensacola, Fla. About $200,000 of local stock has been subscribed for the project.

Right of way is being cleared and graded for the rapid construction of the projected railroad from Fernandina to Jacksonville, Fla. Site for the depot in the city of Fernandina has been selected and soundings are being made in the harbor preparatory to the construction of river front terminals. All bridges along the right of way have been ordered.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Tri-Cities & Northeastern Interurban Co. has had a survey made for a northern route for its projected line. As originally proposed Albany was to be the northern terminal, but Morrison is now under consideration for this. The road will probably be built by J. W. Crowley of the People's Construction Co., Davenport, Ia. Wallace Treichler, Rock Island, Ill., is in charge of surveys.

The Chicago, Blue Island & Joliet Traction Co., 1st National Bank Bldg., Chicago, has filed a mortgage for $500,000 to secure an issue of bonds of a like amount.

The Chicago, Milwaukee & St. Paul Ry. has started work on the construction of a freight yard terminal near Franklin Park, about 15 miles from Chicago. The company has purchased about 800 acres of land at that place, but at the present time will develop only about 200 acres. The cost of the present improvements will be about $600,000. The first improvement on which the company is now working is a receiving yard of eight tracks, with a capacity of 680 acres. When this yard is fully developed it will accommodate nearly 1,400 cars.

The Rock Island Alexis Ry. Co., a subsidiary company of the recently completed Rock Island Southern Ry. has been incorporated into a capital stock of $5,000 and principal office at Alexis, and will build a line from and through the City of Alexis, in Warren County, to some point on the main line of the Rock Island Southern Ry., in Mercer County. The incorporators and first Board of Directors are E. C. Walsh, Clinton, Ia.; M. A. Walsh, Clinton, Ia.; J. W. Walsh, Davenport, Ia.; C. H. Walsh, Burlington, Ia.; G. H. Higbee, Burlington, Ia.

The Falkenau Electrical Construction Co. of Chicago, Ill., has increased its capital stock from $5,000 to $25,000 and the number of directors from three to four.

The Elgin, Joliet & Eastern Ry., A. Montzheimer, Chief Engineer, Joliet, has temporarily suspended operations for the enlargement of the East Joliet yards of the E. J. & E. railroad, pending the settlement of the Meeker Ave. subway and other questions, all of which are involved in the expenditure of the $600,000 appropriation in and around Joliet. All contractors engaged on the preliminary work in Joliet were called off.

The Chicago & Alton R. R. has begun preliminary work for improvements at Bloomington. These, as proposed, include the following: A new and wider bridge over Locust St.; a suitable footbridge over the tracks on Chestnut St.; a similar bridge on Seminary Ave.; a wagon bridge over the tracks at Emerson St.; a wide and deep subway at Division St.

The Kelly-Atkinson Construction Co., a bridge building firm, with offices at 188 Madison St., Chicago, has purchased 2½ acres of land at Rondout, Ill., and will locate its plant and a large warehouse there. Construction work is to begin at once.

The commissioners of Lawrence County, Lawrenceville, are considering a project of straightening the Embarrass River from the Maxwell-Weger levee to Lawrenceville at an expenditure of $175,000. The new work is five miles long.

The construction of an interurban line from Princeton to La Moille and possibly to some point beyond, preferably Mendota or Amboy, is under consideration, and a meeting has been held at Princeton to perfect an organization. It is estimated that the line could be constructed for about $12,000 to $15,000 per mile. The line would pass through a comparatively level country having few gullies or heavy grades. Among those interested are: S. P. Clark, F. W. Clark and H. H. Priestley, Princeton; L. J. Kendall and A. D. Hopps, LaMoille, and H. G. Wells and C. H. Kelly, of Dover.

Advices from Cairo, Ill., are to the effect that the Cleveland, Cincinnati, Chicago & Louisville R. R. will soon construct a spur to the Indian Refining Co., in the drainage district. Arrangements are now being made for the work.

Preliminary work is under way for the new round house and terminal improvements for the Cleveland, Cincinnati, Chicago & St. Louis Ry., in Mattoon. The round house will contain 30 stalls. An appropriation of $150,000 has been made for the work in Mattoon.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Fort Wayne & Winona Traction Co., the incorporation of which was mentioned in our last issue, proposes an interurban line to parallel the Pennsylvania Railroad between Fort Wayne and Warsaw, a distance of 40 miles, in the course of which it will touch Arcola, Coesse, Columbia City, Larwill, Pierceton, Wooster and Winona Lake. It is believed, however, that this is merely the first link in a line from Fort Wayne to Chicago, projected along a route that will touch every county seat between the two cities except Knox. The line to Warsaw, it is estimated, will cost $1,000,000, and the construction will be provided for by a bond issue of approximately $25,000 a mile. The directors are J. A. Barry, Edward G. Hoffman, Ernest W. Cook and Gaylord M. Leslie of Fort Wayne, and Ralph A. Barry of New York.

The Lake Shore & Michigan Southern Ry., according to a communication to the City Council of Laporte, desires to raise its tracks 8 ins. through that city.

T. E. Petrie, City Engineer, of Marion, Ind., has estimated that a retaining wall can be constructed along the river between Boots Creek and Nebraska St., Marion, at a cost of $2,000. It is also planed to make Boots Creek a covered drain, with a promenade from Island Park to Fourteenth street.

Construction work has been started between Hanover and Madison on the new Cincinati, Madison & Louisville traction line and it is said the road will be completed by next January. From Madison the road will go along the river bottoms to Aurora, where it will connect with the Aurora-Cincinnati line. From Hanover the line cuts across the table land to Scottsburg, where it joins the Indianapolis & Louisville traction line. The power house at Scottsburg is being enlarged and a new union station was finished last week. When completed the road will be 60 miles long.

The Muncie & Portland Traction Co., E. B. Ball, President, Muncie, is said to be considering extending its line eastward from Portland to Celina, O., by way of Coldwater and Fort Recovery, O.

The City Council of Hammond has granted a 50-year franchise to the Indiana-Northwestern Traction Co. of Chicago, promoted by Eugene Purtelle of Chicago. The line will connect Cedar Lake, Hammond, Crown Point and Chicago.

The Bluffton, Geneva & Celina Traction Co., Fred Davenport, Chief Engineer, Bluffton, has started preliminary surveys for an extension from Geneva to Celina, O. One of the routes under consideration leads south from Geneva to Bryant, and thence east through the small town of Wabash, near the state line, to Celina. The other route to be surveyed is almost due east from Geneva, by way of New Corydon, Scudder and Durbin.

The Hirschberger Ditch Association of South Bend has been incorporated. The association was organized for the purpose of cleaning all ditches held in common in St. Joseph and Marshall counties.

The University of Notre Dame, Notre Dame, Ind., is to construct a canal one mile long to connect Lakes St. Joseph and St. Marys.

The Elkhart circuit court and the county commissioners have been holding hearings at the court house, Goshen, on a large drainage improvement project. It embraces the straightening, widening and deepening of Rock Run and will drain many acres. The improvement will cost over $100,000.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Iowa City, Ottumwa & Southwestern Electric Ry. Co., with headquarters at Iowa City, and a nominal capital stock of $10,000, has filed its articles of incorporation. Frank Tanner is president; Otto Hill, secretary. The company proposes to build from Iowa City to Ottumwa.

The T. J. Walsh Construction Co., of Davenport, has been incorporated with a capital stock of $25,000, the incorporators being P. T. Walsh, T. J. Walsh and H. C. Kahl, all of Davenport.

The Mason City & Clear Lake Ry. Co., Mason City, is to extend its local tracks at Mason City north along Main St. as far as the cement plant and then extending west to the new Lehigh cement plant site.

In Des Moines, Ia., the Northwestern will extend its tracks across Des Moines St. for the purpose of connecting with the proposed new freight house planned to be built in that vicinity.

Advices from Cedar Rapids, Ia., state that the Milwaukee R. R. has purchased the lower

half of Cedar Lake and is planning some big improvements. The right of way through this city will, it is said, be altered, carrying it straight across the lake on the same grade as the Illinois Central R. R.

The Muscatine North & South Ry., Chas. Howard, President, Muscatine, has sold $1,000,000 of bonds, the proceeds of which are to be used for the extension of the line from Elrich Junction to Burlington. Construction work is to be started soon, it is said.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

City Commissioners of Wichita have directed Bert C. Wells, City Engineer, to prepare a preliminary estimate for the cost of extending the drainage canal to the Arkansas River. The work will cost about $40,000.

Preliminary surveys are being made for the Owl Creek Drainage District which proposes the straightening of Owl Creek. A cut of about 1½ miles will be made. Otto Hough, Iola, Kan., has been making the surveys.

As a result of the conference between Mayor Davidson, Wichita, Kan., and the officials of the Rock Island, Frisco and Santa Fe railroads immediate steps will be taken toward the elevation of the tracks through that city. This work has been under consideration by the railroad heads for some time, but not until this last meeting has anything definite been decided upon.

After inspecting the surveyed route of the proposed Kearney-Beloit Ry., the promoters have begun arrangements for securing the necessary right of way. F. T. Burnham, Kearney, Kan., is interested.

Preliminary surveys are being made under direct supervision of the Chief Engineer for the construction of the proposed line of the Gulf & Northwestern R. R., directly north and south through Western Kansas. Tribune, Kan., it is said, will be the division point.

Ransom & Cook, Ottawa, Kan., have been awarded the contract for the earthwork and excavation for the Atchison, Topeka & Sante Fe Ry reservoir to be constructed south of Chanute. The reservoir will cover about 200 acres and an appropriation of $76,000 has been set aside for the work. The concrete work will probably be done by the railway.

T. L. Campbell of Fort Scott, who has been doing the grading work for the Central Ave. bridge at Topeka, has moved to 422 Park St., North Topeka.

Kentucky Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The new stockholders of the Owensboro City Railway Co., of Owensboro, have elected C. H. Battin and Arthur Funkhouser, both of Evansville, Ind., directors. The railway company was recently purchased by an Evansville syndicate. W. A. Carson, Evansville, Ind., will be General Manager of the lines in Owensboro and Henderson and the Southern Indiana traction lines. Extensions will be made in Owensboro immediately.

Surveyors have started work on the proposed railroad from Tazewell, Va., to Pikesville, Ky., through Buchanan County, Va., and it is expected that plans will soon be completed and that active construction work will be rushed through.

Surveys are being made on the Lexington & Eastern R. R., recently taken over by the Louisville & Nashville, through Betcher county, entering the county at Cornettsville and passing up the north fork of Kentucky River, by Whitesbury, and on into the great Elkhorn coal field. It is expected that this road will also be extended on into Virginia to form a connection with one or more of the lines entering that section. It is stated that actual construction work will be begun shortly.

The Louisville & Nashville R. R. is said to be planning to expend about $100,000 on yards, construction of a new freight house and the remodeling of the passenger station at Paris, Ky.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The property of the Owasso & Corunna Electric Co., of Owasso, has been sold at public auction for $80,000. The property was bought by W. M. Eaton of New York City, a stockholder in the Commonwealth Power Co. of Jackson. It is understood that the Detroit United Rys. will take over the property. This company operated 10 miles of electric railway.

Handy Bros., coal operators, Bay City, who are now building a railroad to Caro, have secured a track laying machine for the work. The roadbed has been graded through to the Akron switch and mine of the company, and the grading will be pushed to Caro as rapidly as possible. Practically all the right of way from Akron to Caro has been secured. The laying of ties and rails, however, will not begin until the grading is well underway towards Caro.

The Grand Rapids & Indiana Ry., E. H. Barnes, Chief Engineer, Grand Rapids, is stated to have started location work for a line to Cedar Springs and to the Muskegon River, 20 miles further north.

Kneal & Ryan, Lansing, have been awarded the contract for constructing the proposed electric railway from Grand Ledge to Lansing. R. E. Olds, Lansing, is the promoter of the line.

The first survey for the through electric railway from Detroit to Grand Rapids, which is being promoted by Wallace & Lau, Detroit, has been completed between Lansing and Detroit, and the engineers have started at Brighton, to work east into Detroit. According to one of the promoters, it is expected that work will be started on the Lansing-Detroit section line this fall. He stated that $500,000 will be available for work on the Lansing-Detroit section this year and $2,500,000 next spring for extending the line west.

The Grand Trunk Ry. has purchased two blocks on McKinley Ave. at Bay City, and proposes the construction of station buildings and freight warehouses, and the laying of terminal tracks, etc., at an expenditure of over $100,000.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

M. C. Connors & Co., Chicago, Ill., have been awarded the contract for grading six miles of the projected interurban line from Kirksville to Hannibal. This section is located between Palmyra and Philadelphia, the contract covering six miles of line from the latter place.

The Manufacturers' Ry. Co., of St. Louis, George F. Moore, President, will, it is said, ask the Municipal Assembly of St. Louis for a franchise to use several acres of public streets as part of its $10,000,000 terminal yards in South St. Louis. The Manufacturers' Ry. Co. is stated to be negotiating with three Eastern trunk lines, one of which is said to be the Chicago & Northwestern, with a terminus 47 miles from St. Louis.

The Board of Water Commissioners of Kansas City, Mo. will probably have to construct about two miles of revetment between Quandaro and Parkville in order to prevent the intake stations of the Kansas City, Mo., and the Kansas City, Kan., water works at Quindaro from being left inland and put out of commission by the shifting of the Missouri River.

The Springfield Traction Co., F. A. Gallagher, Superintendent, Springfield, is to commence work on its Grand St. subway in that city. The traction company will do most of the work of building the subway. It will have charge of the excavating and the concrete work, while the Frisco railway will provide for the iron work of the structure.

M. M. Stephens, ex-mayor of East St. Louis, Ill., has offered to build a 4-mile electric road from Columbia to the coal fields at a cost of about $100,000, if the men in the county who are interested will raise $30,000 in stock, to be paid for after the road is completed and running. The money is to be subscribed within the next month, at the end of which construction work will begin. According to the plan the road will be completed within six months.

The several properties of the Missouri Water, Light & Traction Co., at Nevada, Mo., are to be transferred to a new company headed by Judge Erb of Chicago. If the deal goes through a general reorganization and improvement of the system will result. Among the proposed improvements is a plan to either buy the park or build a line to the state rifle range, three miles out of Nevada, and establish a park somewhere on the new line.

W. C. and W. R. Gunn of Fort Scott, Kan., have applied to the City Council of Nevada, Mo., for a franchise for supplying that city with natural gas. The source of supply is the Oklahoma fields, and it is proposed to lay an 8-in. pipe line to Nevada from Fort Scott, a distance of 21 miles. The promoters say they will have natural gas by the coming winter if granted a franchise.

The injunction suit of the Rock Island R. R. against the city of St. Louis to prevent the enforcement of the ordinance doing away with steam trains in Forest Park has been adjourned until June 30 by Circuit Judge Fisher. Engineers of the Rock Island testified that the change to electric trains would entail a cost of $1,000,000 to $1,500,000.

According to advices from Springfield, Mo., the T. P. Jones Construction Co., of Jefferson City, Mo., has been awarded the contract for the Missouri Pacific Ry.'s Bagnell extension from that city south 60 miles. This work, it is said, has been under consideration by the officials for several years.

Surveys are now under way by the Kansas City, Sapulpa & Southwestern for the construction of the proposed line for which a charter was granted about two years ago. As projected the route will be along the original survey from Joplin, Mo., southwest through Sapulpa and Shawnee, Okla. W. H. Henderson, Guthrie, Okla., is Chief Engineer of the company and will be in charge of surveys.

Meetings of the Mississippi River Commission have been held at its offices in the Liggett building, St. Louis, to consider making allotments for levee work. Among the applications received at the meeting on June 23 were the following: William Holloway and Judge W. T. Marshall reported to the commission regarding the progress of levee work in Mississippi County, Mo., for which the commission made the survey about a year ago. I. M. Worthington, president of the Chico County Levee Board of Arkansas, urged the need of work in that district. W. J. Shackelford, chief engineer, and Walton Shields, attorney, asked bank revetment to protect the levee at Albemarle Bend, south of Greenville, Miss., where the cutting of the banks threaten the levee. John G. Jones, connected with the Yazoo and Mississippi Valley Railroad, urged the same work, declaring the railroad, which runs behind the levee, was threatened with overflow should the levee be broken by the river. Jeff Truly and John F. Jenkins, both of Natchez, representing riparian owners in Mississippi between Vicksburg and Fort Adams, told the commission the lands of the petitioners were overflowed at high water, and asked aid in the construction of a levee. A survey to locate the levee in the most desirable place and expert supervision in its construction was asked of the commission.

St. Louis Items.

BY A. B. KOENIG.

Costello Bros. have finished their work on the Mo. Pac. R. R. at Kirkwood and have shipped this outfit on to their Big Four work in Indiana.

McCann Bros. have their outfit at work now at Bridgeport, Ill.

Tom Keating of Keating Bros. came to town last week, bought some more mules to add to their outfit at work on the Big Four R. R. near Evansville, Ind.

The Carter Construction Co. have about finished their contract on the Herrin & Metropolis branch of the Burlington R. R. in Southern Illinois and have moved a part of

their outfit to Maryland, where they have an extensive contract.

John Marsch has finished his work at Benld, Ill., and has moved his steam shovel up into Wisconsin.

Foley Bros. came in from Minneapolis, bought 122 mules and 4 horses which they shipped to their Grand Trunk work in Canada.

H. B. Johnson of Denver, who is one of the vice-presidents of the projected St. Louis-Kansas City Electric Railway, after arriving in St. Louis the other day, told friends in the financial district that arrangements are being concluded to finance the enterprise. He said DeWeese C. Nevin, president, has sailed for France, having received assurances from Paris that a syndicate will furnish the requisite capital. The undertaking was launched by W. H. Chase at St. Louis. Mr. Chase retired as an officer and Selden P. Spencer became a member of the Board of Directors. Mr. Nevin, who was connected with an insurance company at Denver, was chosen to take charge of the work. For several months agents have been obtaining stock and bond subscriptions as well as right-of-way and terminal properties and engineers have been locating the route. The intention is to construct a double-track "gradeless and curveless line" from St. Louis to Kansas City, crossing Missouri by a direct route of 250 miles. The projectors contemplate a road even shorter than the Wabash, and plan operating exceptionally high-class through trains at high speed. Progress has been made with citizens, municipalities and counties in the interior of the state regarding subscriptions and right-of-way, and Mr. Nevin is confident of obtaining financial backing in France. After the route is definitely selected, it is probable arrangements will be made for entering St. Louis and Kansas City. Although it was thought the company would arrange to cross the present St. Charles bridge, it is considered doubtful whether the plan will be adopted as bridge traffic has been restricted to passenger business and the company proposes handling freight. The Missouri River will be crossed twice. The road may enter St. Louis from the north instead of the west.

Wm. Nuttal of M. C. Connors & Co. of Chicago spent last week with us.

The Cape Girardeau & Thebes Terminal Railroad has been undergoing some changes. Six miles of the line from the Cape south have been made a bee line and several bad curves have been taken out. This insures quicker time for the suburban trains out of the Cape to Kelso, Illmo and Edna, and for Cairo and St. Louis connection with the Cotton Belt at the Thebes bridge.

Quite a number of our western contractors are out looking over the new Colorado Southern work which they are going to let between Pueblo and Walsemburg. So far we have not heard the name of the lucky bidder, but will publish same as soon as we get this information.

Henry Schweitzer got in on some new Big Four work the other day at Vermillion Grove, Ill.

Street Commissioner Travilla last week submitted his annual report to the Board of Public Improvements showing the expenditures for the fiscal year in that department. The largest items were for sprinkling and street cleaning. The report shows that about 19 miles of streets were made; brick, miles, 8.16, $360,389.50; asphalt, 5.49 miles, $299,-314.70; bitulithic, 3.79 miles, $222,201.61; granite, .02 miles, $744.50, and telford, 2.02 miles, $72,814.20. During the year the city paid $310,241.39 for construction and reconstruction of about 17 miles of alleys. The Street Department spent $434,212.74 for repairs and $652,233.86 for street cleaning. Other items of expense were: Labor and carts, $192,503.53; cleaning stone, wood block and asphalt streets, $289,909.76; block system, $169,730.57; garbage removal, $186,793.39; street reconstruction, $104,120.38. According to the report, the department used 25,325 loads of macadam, which was furnished by the Workhouse prisoners. In connection with the report was that of the City Forester, which showed that 14,368 trees were pruned, 2,387 were removed and 51,777 were treated at an expenditure of $11,660.55.

Air was turned last week into the caisson for the west shore pier of the Municipal Free bridge, which is on its way to rock bottom at the foot of Lombard St. The floating of air compressor plant, which has been keeping the water out of the east shore caisson, was moved across the river some time ago and put in readiness for work on the west side of the river. Work on the east pier has been stopped by the high water. An air pressure is required inside the working chamber of the caisson to keep out the water as soon as the cutting edge of the caisson reaches below the level of the water in the river. President Reber of the Board of Public Improvements ordered the city dump for street refuse moved from the foot of Gratiot St., above the site of the pier to Chonteau Ave., below the site of the pier, because the floating refuse interfered with the operation of the pumps on the compressor barge, the refuse being drawn into the suction pipe of the pump and clogging the contrivance. The pump carries water into the caisson to be mixed with the material being excavated so that it can be drawn out of the caisson in a fluid state.

The Morey Faulhaber Co., 1212 Chemical Bldg., St. Louis, have some awful nice work to let on the extension of the Santa Fe R. R. in Texas.

Claude Mimms & Co. have their outfit at work near Nortinville, Ky.

Laborers are very scarce in St. Louis at the present time.

We understand that some of the Northern roads are laying off quite a number of men. There will be no trouble for all of these men to get work if they come to St. Louis. There is not one-fourth enough laborers in this city to supply the demand.

L. P. McClavy is building a muck ditch near East Cape Girardeau.

The Board of Public Improvements last Tuesday awarded the contract for the construction of the first section of the Baden sewer to the Hoffman-Hogan Construction Co. for $288,157.15, which is about $25,000 above the original estimate. A bill to appropriate the difference was passed by the Municipal Assembly recently. Bids were opened on the second section of River Des Peres foul water sewer, the Universal Construction Co. submitting the lowest of four proposals. That company offered to do the work for $604,-518.85. The others were Scott, Hannon & Hickey, $616,518.71; John F. McMahon, $614,-638.44, and Fruin-Colnon Contracting Co., $678,032.88. The estimate was $615,000. The board did not award the contract to the lowest bidder, which is a firm unknown to the members of the board and if, after investigation, the board is convinced the company can do the work, its bid will be accepted. Wm. P. Carmichael Co. got the contract for the Kingshighway viaduct, its bid being $336,380. The estimate of the board was $400,000.

McCaughey Bros. report rapid progress with their Burlington work in Wisconsin.

T. B. Jones & Co. are at work on the Missouri Pacific R. R. just west of Jefferson City, Mo.

Jock Lee, send your address to Koenig in St. Louis.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A bill has been introduced in Congress to permit the Columbus Power & Electric Co., organized in South Dakota, to build a dam across Clark's fork of the Columbia River at Thompson, Sanders County.

H. H. Nelson, Vandalia, Mont., has moved his construction outfit to North Dakota where he has some railroad work.

Contract for the construction of the proposed line from White Sulphur Springs to Dorsey, Mont., on the Chicago, Milwaukee & Puget Sound R. R., mentioned in our last issue, has been let, it is reported, to McIntosh Bros., Milwaukee, Wis. John Ringling is promoter of the line.

The Gilmore & Pittsburg Surveyors who are working from Armstead toward Dillon, Mont., through Ryan's Canyon, have just moved their camp from the mouth of the canyon, nine miles south of Dillon, and are now surveying down the valley toward the latter city. According to the survey through the canyon, there will be a 600 ft. tunnel near Grayling and an overhead crossing above the Oregon Short Line tracks will be made at Beaver head rock, the tressle passing close by the rock and striking the hill side about 100 yds. north.

New Jersey Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Wildwood & Delaware Bay Short Line R. R. Co., of Wildwood, N. J., organized several months ago to construct a new line of railroad from the resorts on the island to the line of the Reading that runs to Cape May, has taken out a charter, and work will be begun in a short line. The promoters propose a double-track line to the intersection of the Reading line and thence continue with a single track to the bay shore, from which point a steamboat line will be operated to Philadelphia.

The Ocean City Electric R. R. Co., Ocean City, is to start work at once on a new line down Bay Ave. from 7th to 18th Sts., also on the spur down 10th, from the bay to the boardwalk.

The lines and equipment of the Burlington County Railway Co., which recently fell into the hands of a receiver, have been sold to the bondholders on a bid of $120,000 made by A. Merritt Taylor, of Philadelphia, who represented the purchasers. This line is 14.8 miles long and connects Moorestown, Hartford, Masonville, Hamesport, Burlington and Mount Holly.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The town board of Saratoga Springs has granted a franchise to the Hudson Valley Ry. Co., Glen Falls, N. Y., to lay tracks in East Ave. for the purpose of connecting the Glens Falls and Troy divisions of the electric railway.

The Fonda, Johnstown & Gloversville R. R., J. Ledlie Hees, President, Gloversville, N. Y., has asked the City Council of Amsterdam for a franchise giving it the privilege of double-tracking East and West Main St, and of constructing a belt line from the tracks in the east end of the city over the hill to the company's tracks in the Eighth Ward. The cost of the work will be about $140,000.

The directors of the Hudson Valley Ry. Co. will hold a special meeting at Glens Falls on July 20 to consider among other things the action of the management in accepting a franchise to build a line on East Ave., Saratoga.

City of Fulton, N. Y., is in receipt of information that the New York, Ontario & Western R. R. Co. contemplates enlarging the freight yards both in the northern and southern parts of the city.

The Board of Estimate of New York City will shortly provide funds for the commencement of work on the Jamaica Bay improvement. The Board several weeks ago appropriated $1,000,000 for the preliminary work. Congress has appropriated $750,000 for the Federal Government's part of the work and the state has set aside $250,000 for its share.

The stockholders of the Lehigh Valley R. R. in special meeting have voted to increase the capital stock of the company from $40,334,800 to $80,000,000. The directors were empowered to issue and dispose of as many of the additional shares as they think necessary for paying the debts of the company, constructing and completing the railroad and to construct branches not exceeding 12 miles in length.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Norfolk & Western Ry., C. F. Losh, Assistant Engineer, Portsmouth, O., is to

build an underground passageway between its shops and Norfolk St. at Portsmouth. The subway will be commenced immediately.

The Cincinnati, Lawrenceburg & Aurora Electric Street R. R. Co., Cincinnati, O., is planning to extend its line up to Mill Creek, a distance of five miles from its present terminus at Anderson Ferry. The extension will be made to secure an entrance to the new union depot at Cincinnati.

The Commissioners of Clark County, Springfield, have been petitioned to widen, straighten and deepen Mad Run for a length of 2½ miles, from the bridge across the Enon road down stream towards Medway.

The Baltimore & Ohio R. R. is reported to be planning several improvements at Massillon, to include the changing its right of way to eliminate curves south of Walnut St., and double tracking the road to the town at Columbia.

The Pennsylvania R. R. has made surveys for yards in East Hamilton. The new track will consist of three storage tracks, one of a capacity of 100 cars and the other two will hold 60 cars.

A company is to be organized at Toledo to build and operate a street car line to extend from the present Ottawa Park line west along Bancroft St., to the Minert road, Talmadge Ave., thence to Monie St. The line will be about nine miles long and nearly all of the right of way has been secured. Attorney H. C. Adams, Toledo, is interested.

Surveys are to be made at once for double tracking the Baltimore & Ohio Southwestern Ry. between Cozaddale, O., and Midland City, O., a distance of 14 miles. About $200,000 is to be spent for the improvement, which will be made this summer.

The Cleveland & Pittsburg Ry. construction crew have pitched a camp at Homeworth, which will be their headquarters until the 7 mile link between Alliance, O., and Homeworth is double tracked. The work includes widening a number of bridges and the construction of a number of concrete piers. Work will be completed, it is said, in about one year.

The Chesapeake & Ohio Ry., which has recently taken over the Chicago, Cincinnati & Louisville Ry., is planning the improvement and development of the latter. The high trestle entrance to Cincinnati, O., will be eliminated by constructing a cutoff between the C. C. & L. and the C. & O. from Cottage Grove, Ind., 45 miles north of Cincinnati, to Silver Grove, Ky. The proposed extension will circle across the country a few miles for Cottage Grove to a point on the Ohio side of the river opposite the C. & O. station of Brent, which is 11 miles from the Cincinnati Union depot. This will necessitate the erection of a bridge across the Ohio River, and it is said Chesapeake and Ohio officials have estimated this will involve the expenditure of between $2,000,000 and $3,000,000. The new connection will be double-tracked, as will the whole of the present line from Cottage Grove to Chicago, according to present plans, and the whole road will be put in a strictly up to date condition, the intention being to make it capable of extremely heavy freight traffic with a view to carrying a great bulk of the Chesapeake and Ohio coal tonnage.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Board of Park Comissioners of Oklahoma City have awarded the contract for the construction of the spillway of the dam for the lake in Northeast Park to the Illinois Concrete Machinery Co. of Buda, Ill., for $8,300. The contract stipulates that the company use its own steel forms in the construction of the spillway.

The Muskogee Electric Traction Co., R. D. Long, Manager, Muskogee, is to extend its Fon du Lac line 1⅜ miles west to the fort or Agency Hill at Muskogee.

The Clinton & Oklahoma Western, now in operation between Clinton and Butler in western Oklahoma, is planning the extension of its line. C. C. Goodman, Fort Smith, Ark., is promoter of the line.

The Cherryvale, Oklahoma & Texas R. R. has grading well under way on the first division of the projected line and work will be completed to Wann, Okla., by July 1, it is expected. S. M. Porter, Caney, Kan., is at the head of the company.

Citizens of Colony, Okla., have appointed a committee to take charge of the matter of securing the necessary bonus for the construction of the Oklahoma Western railway through that place. J. W. Graves is one of the committee.

Petitions, having the backing of the State Federation of Labor and the Farmers' Union, are to be circulated calling for state ownership of a system of interurban railway lines to compete with the steam railroads. It is expected that the right of the state to own and operate lines shall be incorporated in the constitution. Provisions are made for the creation of a state board of railway construction and transportation, and that all employes shall work under a civil service system. It is further proposed that all control of the railroads be put up to the state board and the question removed from politics and legislative control. Special attention is to be paid to the question of the feasibility of hauling children to the rural school free of charge whenever practical.

A construction company has been organized at Granite for the purpose of constructing the Granite, Willow & Western Ry. The proposed line will pass through the towns of Granite, Willow, Blair, Erick and several other places. It is planned to start the work of construction as soon as possible. Surveys are under way.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

FROM CORRESPONDENTS AND OTHER SOURCES.

Engineers of the United Railways Co. are making surveys for the construction of a 30 mile line from Tillamook, Ore., to Pacific City. It is expected that no heavy grades will be encountered and that no large cuts or fills will be made, as the proposed route will follow, to some extent, the county roads. J. E. Gardner, Portland, Ore., is Chief Engineer.

Southern Pacific Surveyors, according to reports, are running lines for the construction of a road from Sheridan to Pacific City, Ore., by way of Beaver, Hebo and Cloverdale.

Track laying has been completed on the Gray Harbor & Puget Sound line, a subsidary of the Union Pacific, to Cosmopolis, thus making connection with Portal Junction, southeast of Rochester. As the Chicago, Milwaukee & Puget Sound line between Portal and Rochester are completed, the Union Pacific will give a direct communication from McKenna, 25 miles south of Tacoma, to Cosmopolis. The Union Pacific also has under construction a belt line radiating from Cosmopolis, Wash., and a line from Portal to Centralia to connect with the Oregon & Washington Ry.

C. J. Young, who has the contract for grading about 40 miles of the Oregon Trunk Line Ry., has shipped his entire outfit, consisting of about 40 cars of teams, wagons, scrapers and various camp equipment, up the Upper Klamath Lake to the Klamath Agency landing, from where it will be transported to the site of construction. Work will be rushed with all possible rapidity and it is expected to have the line in operation from the north by the end of this year.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Cumberland Ry. Co., of Carlisle, Pa., now operating seven miles of electric railway from that place, and which also is constructing a line to Newville, is to make three extensions of its lines. One is from a point in South Middleton Township to and along the Carlisle and Chambersburg turnpike; the other two are over various streets in the borough.

The Philadelphia & West Chester Traction Co., Philadelphia, is to double track its Ardmore and Llanerch branch from Llanerch to Ardmore.

The route has been approved for a further extension of the Hanover & McSherrystown Street Ry., to run from the present terminus of the extension now being built, to the public square in New Oxford borough.

Final surveys have been made and right of way secured for a new branch of the Lehigh Valley R. R., E. B. Ashby, Chief Engineer, New York City, between Lumber Yard on the Hazleton branch and Hayes Creek on the main line of the Lehigh Valley. The branch will pass through Old Buck Mountain and will cross the main line of the Central Railroad of New Jersey and Lehigh River, opposite Hayes Creek, by a bridge 90 ft. high and over 1,300 ft. long. The bridge will cost approximately $1,200,000 and will take over two years to build.

The Pennsylvania R. R. is said to be planning the expenditure of $700,000 more for increased passenger terminal facilities between the Broad Street Station at West Philadelphia and Philadelphia. The work is to be completed before next fall. Across the Schuylkill River the south bridge, used by main lines and New York division trains, is to be widened to carry four tracks. Under this arrangement the four-track system at West Philadelphia may be carried right through to the elevated lines east of the Schuylkill River.

Advices from Scranton state that rights on the Paujack River, which divides Wayne and Pike Counties, have been bought for an electric power plant for Northeastern Pennsylvania. The rights cover 10,000 acres from Wilsonville to Lodgedale. It is proposed to construct a dam holding 40,000,000,000 gallons and flowing back 14 miles.

Rapid progress is reported by the Pennsylvania Railroad forces on the construction of new line through Bristol, Pa. The work will eliminate ten grade crossings and the heavy curve now through the city. The work includes the construction of four tracks. To make this change of line will necessitate the grading of some 550,000 cu. yds. of earth and the construction of 5,000 cu. yds. of arch masonry and 12,000 cu. yds. of bridge masonry. The street bridges will be constructed with reinforced concrete, with solid floors. At the present time about 256,000 cu. yds. of embankment have been made and 4,000 cu. yds. of concrete masonry built. One of the present tracks will be left on the old location as an industrial side-track to reach the new large factories in that part of the city.

South Carolina Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Greenville, Spartanburg & Anderson Trolley Co., of Greenville, S. C., which projects an extensive electric railway system, is to make a survey for an extension from Greenville via Laurens to Clinton.

The Columbia & Atlanta Ry. & Steamboat Co. has been chartered with an initial capitalization of $100,000 and proposes to operate a line of steel freight and passenger boats between Columbia and Charleston and Georgetown and to build and operate a steam railway terminal and warehouse system in Columbia. T. C. Williams of Columbia is president and principal stockholder.

South Dakota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The organization of the South Dakota Interurban Ry. Co. has been perfected at Parkston, S. Dak., the following officers being elected: President, V. E. Miller, Bijou Hills, S. Dak.; vice-president, A. F. Grimm, Parkston; secretary, F. E. Graves, Bijou Hills; treasurer, R. W. Thwing, Bijou Hills. The company proposes to construct an electric railroad from Parkston to Bijou Hills, and from Parkston to other places.

It is reported that equipment and laborers are being shipped to Granite Falls and Montevido, Minn., by the Chicago, Milwaukee & St. Paul for the purpose of constructing double track on their Hastings and Dakota line from St. Paul to South Dakota line. It is said that the increase of freight traffic makes this move necessary.

Advices from Omaha, Neb., are to the effect that promoters have not dropped the proposition to construct the projected railroad

from that city to Yankton, S. Dak. The idea seems more probable now than ever, as the Milwaukee lines will be constructed through Fremont, a station on the proposed Omaha-Yankton line.

D. C. Washburn, County Surveyor, Aberdeen, S. Dak., is making surveys for a railroad from Watertown to Fargo, via Webster.

The Chicago & Northwestern R. R. has completed track laying on its new line into Newell, and it is expected that trains will be operated as far as Nisland, a town 18 miles east of Belle Fourche, S. Dak., by the last of June.

Tennessee Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Memphis Union Depot Co., Memphis, has awarded the contract for its station building to the Murch Bros. Construction Co. of St. Louis, Mo. The station will cost about $500,000. The Murch Bros. Co. is now established in Memphis, being engaged in erecting the Central Bank and Trust Co.'s office building at Madison Ave. and Second St., Memphis. This work is in charge of Thomas Jarvis, who has offices in the Porter building.

The Athens & Tellico Ry., J. B. Wright, President, Athens, Tenn., will expend about $75,000 for replacing trestles with fills, revising grades and laying new track. The road is 25 miles long and was recently purchased by the Louisville & Nashville.

The Southern Ry. is planning a number of improvements for its main line between Memphis and Chattanooga. Orders were placed some time ago for a large amount of new steel rails and portions of the line between Memphis and Chattanooga will be rebuilt with the new steel, and all bridges will be reconstructed.

Work is to be started at once, it is said, on converting the Holston Valley Ry. of Bristol into an interurban electric line. The work will cost about $100,000. The line at present is 11 miles long.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

N. A. Brown of Dallas has been granted a franchise to construct a street car line in Amarillo, connecting San Jacinto Heights with Polk St., and it is understood that actual construction will begin within less than six months. The line will be about two miles long.

Roach & Stansell, Memphis, Tenn., are to at once start work on their contract for grading the first 25 miles of the line of the Kansas City, Mexico & Orient R. R., from Del Rio north. This makes about 115 miles of work which Roach & Stansell have on this road.

A drainage district is to be organized in Bell County and Milam County for improving Little River by dikes and levees. The improvement work will be carried on from the Bell County line to the San Gabriel River, and approximately 10,000 acres will be protected from overflow.

According to advices from Temple the contract which the C. H. Sharp Construction Co., Kansas City, Mo., now have underway for revising the grade of the Santa Fe line from Temple to Coleman, amounts to $1,394,805.63, distributed as follows: Temple to Lometa, $356,558.50; Lometa to Brownwood, $454,044.45; Brownwood to Coleman, $584,202.68. The maximum grade from Temple to Brownwood after the work is completed will be 1¼, and from Brownwood to Coleman, .6.

The Dallas Terminal Ry. & Union Depot Co., Dallas, is planning to construct large yardage, round house and terminal facilities in South Dallas, close to the Trinity River.

The City Commission of Fort Worth decided upon the construction of a modern subway under the numerous tracks of 14th St. from Jones St. to the point where Lucella and Crump Sts. converge.

The Railroad Committee of the Chamber of Commerce, Dallas, Tex., are taking steps to secure the construction of the Gulf, Texas & Western from its present terminus at Seymour to Dallas. Benjamin B. Cain, Dallas, Tex., is Vice President and General Manager of the company.

The Sonora, Tex., Business Men's Club has accepted the proposition of the Kansas City, Mexico & Orient R. R. to purchase $200,000 of bonds and donate 160 acres of land to secure the construction of the company's proposed line to Del Rio through that city within two years.

Advices from Corpus Christi, Tex., are to the effect that an announcement has been made stating that construction work will begin shortly on the St. Louis & San Francisco R. R. line from Brady to Corpus Christi, via Kingsville, Tex. The route of the proposed line will pass through five counties at the present time with no railroad service.

Information received from Pecos, Texas, states that a party of Santa Fe Engineers have completed an automobile survey from Brady, Tex., via Rudd, Eldorado, Ozona, Sheffield and Fort Stockton, Texas, to Pecos, Texas, a distance of 300 miles. Permanent location of the road has been made as far as Rudd, 70 miles, and the party is pushing westward. On account of the possibility of obtaining an easier grade from Pecos to a connection with the Santa Fe south from San Angelo, it is thought the road will be constructed direct from Brady, leaving San Angelo, Tex., about 30 miles to the north.

Engineers are now running the preliminary lines for the St. Louis & San Francisco extension from San Antonio to Alice. The latter place has raised a bonus of $20,000 for the line and other places along the route have also raised bonuses. It is said that construction work will be started within 12 months.

In connection with the construction of the Kansas City, Mexico & Orient line to Del Rio, Tex., the Mexican National Railroad is now constructing a line from Allende, Mex., north to Del Rio. When finished the lines will form the shortest possible route between Kansas City and the City of Mexico.

J. J. Lannin, representative of Chicago capitalists, who promoted the Sterling, Tex., extension, is expected to arrive at Garden City, Tex., shortly to take up the matter of building a railroad from Big Spring to Ozona.

The San Antonio, Rio Grande & Tampico Ry. Co., which projects the construction of a new line from San Antonio through Southwest Texas to Tampico, Mex., has applied to the Railroad Commission for authority to cross at grade the track of the Artesian Belt R. R. at Artesia, Tex. It offers to provide a strong gate for safety purposes and an interlocking plant as soon as operations commence.

As a result of a recent visit of officials of the Southern Pacific Co. to Llano, it is said that the company has under consideration the project of extending its Llano branch west to a connection with the Fort Worth & Rio Grande division of the Frisco, which is now being extended southwest from Brady to Menardville. The extension of the Southern Pacific would be about 75 miles long, and, if conditions are deemed favorable, it is said that it may be extended all the way to a connection with the transcontinental line of the Southern Pacific at Sanderson, Tex., 250 miles. Two railroads are now being constructed south from the coal fields of Erath and other counties of that section, with Llano as their southern objective point. The completion of these roads will place the iron ore and the coal fields within 150 miles of each other, and it is expected that this will bring about the establishment of iron and steel works in the Llano district.

It is reported in Comanche, Tex., that grading on the roadbed of the proposed Temple & Northwestern Ry., from Temple to Comanche, is to start at once on this end of the line. Practically all right of way has been deeded the company.

Surveys are well under way by engineering department of the Texas North & South Ry. Co. The corps is divided in two parties working north and south of Fredericksburg, Tex. When surveys have been completed from Boerne to Mason, Tex., grading contracts will be let.

Mass meeting of citizens of Colorado City and Robert Lee has been held to consider the engineer's report for building the Colorado & Conchos R. R. The line, as proposed, will be 43 miles long, and the two cities have already raised $125,000 for its construction. S. B. Kemp, Robert Lee, is interested.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Bonneville Mining Co., organized by Jesse Knight of Provo, for the purpose of prospecting the mountains between Provo and Springville for mineral and water, has started work on the Bonneville tunnel. The tunnel is east of the Crandall farm, about three miles southeast of Provo. It is possible another tunnel will be started, but this is not certain. In all events the country will be thoroughly tested by deep tunneling for mineral and water. George A. Storrs is in charge of the work.

The Oregon Short Line surveyors are now working up the Gentile Valley country from Preston, Utah. It is said that an extension into this section, which is being rapidly settled, has been under consideration for some time. Such a line would place Logan, Utah, on a practically through route.

The Utah Copper Co., it is said, is considering the construction of a railroad through Bingham County, Utah, for the purpose of transporting ore from the company's mines. The line would be 17 miles in length and is estimated to cost $2,500,000.

M. T. Burgess, C. E., Salt Lake City, Utah, is taking steps toward securing the support of the Commercial Club for the Iron Mountain, St. George & Grand Canyon R. R. The proposed line will take off the main line of the Salt Lake Route at Thermo, about half way between Milford and Lund, and from there will extend southward to Cedar City, taking in the great iron and coal fields of that region. From Cedar City one branch will extend to St. George, and eventually to a connection with the Santa Fe at Kingman, Ariz. The other branch will extend from a point near Cedar City, through the Virgin river oil fields to the Kaibab plateau and the Grand canyon of the Arizona.

Plans are reported under consideration for the extension of the street car system of Logan to Providence, a town two miles north. David Eccles, Ogden, Utah, is president.

West Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

It is stated that work is to be started soon on the first section of the projected interurban line from Wheeling to Uhrichsville. This section will extend from Cadiz to New Athens, and will be eight miles in length. The two towns have subscribed for $90,000 of stock. The J. J. Burns Construction Co., Isabella Bldg., Chicago, Ill., will build the line.

A charter has been granted to the Parkersburg, Glenville & Burnsville Electric Ry. Co., which proposes to build this season from Parkersburg, W. Va., to Burnsville. Surveys have already been made.

Joe Fuccy, contractor, of Weston, has recently completed a deep cut at Everson, which will prevent a fire in an abandoned mine from reaching a valuable acreage and from getting into the various mines in that section being worked by the Consolidation Co. Mr. Fuccy has also been grading for a railroad siding at Meadowbrook for the Grasselli Chemical Company's new plant there.

Contract for the construction of the coal carrying railroad in Kanawha County, W. Va., has been let to W. O. Lipscomb, Roanoke, Va. The line will be used by the Campbell Creek Railway and Coal Co., a large coal mining corporation in West Virginia.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chicago, Milwaukee & Puget Sound Ry. and the Oregon & Washington R. R., the latter a Harriman line, have filed condemnation suits to obtain right of way through Cow-

litz Valley south to Tacoma. The Harriman lines seek to build up the valley from Winlock, where the largest agricultural region of the state is now without railroad transportation.

Advices from Vancouver, Wash., state that notice of the dissoltion of the Wallula Pacific R. R. Co., and the Columbia Valley R. R. Co. was filed June 9 with the clerk of the Superior Court of Clarke County. The capital stock of the first was $10,000 and the latter $30,000. The stockholders were James P. Stapleton and E. M. Rands.

According to reports Engineers are preparing to make preliminary surveys for the construction of the proposed Huntington-Lewiston R. R. Officials, it is said, were in Clarkston, Wash., recently preparatory to starting condemnation suits to secure right of way for the line through that place.

Work is to be completed by early winter on the rebuilding the line of the Great Northern Ry. for several miles west of the Cascade tunnel. For a great part of the eight miles west from Cascade tunnel to Scenic Hot Springs the road will be double tracked instead of single tracked as now. Reinforced concrete snow sheds will be built over the two tracks for a mile west of the point where the Wellington avalanche occurred last March. These snow sheds will have roofs of solid steel and concrete and will be most substantially built. Approximately 400,000 cu. yds. of rock work is to be handled by the contractors, Grant Smith & Co., of Spokane. These figures indicate the magnitude of the exacavation work along the steep slope of the mountain west of Wellington. Practically a new roadbed will be dug out of the mountain side wide enough for two tracks, above which the concrete and steel snow sheds will be erected as a protection against future trouble from slides. It is stated that there will be 14,000,000 feet of timber used in the reconstruction of the line west of Wellington. The cost is estimated at more than $1,000,000.

Favorable progress is being made with the double tracking of the Northern Pacific Ry.'s main line from Tenino to Kalama. The double track between Chehalis at Centralia was placed in use some days ago and the sections between Centralia and Bucodam completed by June 16. Seventeen steam shovels are at work along the line and between 1,700 and 1,800 men are employed either on the grading or track laying. By November it is hoped to have the double tracking entirely finished.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The State Railroad Commission has given the Chicago & Northwestern Ry. authority to build 16 miles of railroad in Barron county.

The Neillsville Electric Co., Neillsville, is planning to construct a new power plant at Weston Rapids, requiring the construction of a dam. A bond issue of $60,000 has been authorized for the work.

The Milwaukee Northern Ry., Cedarburg, Wis., is said to be considering a plan to extend its Milwaukee-Sheboygan interurban line through to Manitowoc.

The Milwaukee Western Electric Ry. Co., Milwaukee, is to build an extension this summer from Fox Lake to Green Lake.

The receivers of the Chicago & Milwaukee Electric Railway are said to be planning to build a line into the heart of Racine to connect the main line of the company with the center of Racine.

The Wausau Sulphate & Fibre Co., Wausau, Wis., began excavation work for a plant 520x92 feet at Mosinee. A dam for the purpose of generating power will be built some time this summer.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Toronto, Niagara & Western Ry. Co. has applied to the Ontario Railway Board for permission to build a line from Burlington.

The Canadian Northern Ry. has awarded the contract for building its line from Hawkesbury to Montreal to J. P. Mullarkey, of Montreal, Que. The line is in operation between Ottawa and Hawkesbury. This line from Hawkesbury to Montreal, as originally surveyed, follows the Carillon & Grenville Railway—now controlled by the Canada Central—between Grenville and Carillon. From the latter point it continues in almost a straight line to St. Eustache, through St. Andrews and St. Benoit. The back rivers are to be crossed near Ste. Genevieve. On the island of Montreal the route is still somewhat uncertain. The original survey shows the route as running from Cartierville to the present C. N. R. terminals at Longue Pointe.

Foley, Welch & Stewart have been awarded the contract for constructing 25 miles of the Kootenay Central Ry., a subsidary line of the Canadian Pacific.

The Canadian Northern Ry. will make extensive improvements on the main line between Winnipeg and Edmonton this summer. The road will be thoroughly ballasted and relaid with 80-lb. steel in place of the 60-lb. rails now in use.

The Ontario Railway and Municipal Board has issued a preemptory order directing the Toronto Street Railway to proceed with the construction of the lines of railway referred to in the order of May 18.

The Canadian Pacific railroad has awarded a contract to the American Bridge Co. of Pittsburg, Pa., for supplying 10,000 tons of structural steel for the new bridge over the River St. Lawrence at Lachine. Contract has been hanging fire for some time.

Forest fires on June 21 exploded two powder magazines owned by Contractor McEween, who is working on the N. T. R. north of Lake Nepigon. The magazines contained 100 cases of explosives, and were valued at $15,000. They were on an island, and the fire jumped across from the mainland. No one was injured.

The city of Edmonton, Alberta, has voted to grant a franchise for a radial railway and for a Pintsch gas plant.

The Canadian Northern R. R. has a large force of men and teams at work on Gypsumville extension of its Oak Point branch. It is the intention of the company to complete the road and have it in operation to the gypsum mines by winter.

The completed portions of the Oakland branch of the C. N. R., from Oakland and from the Ochre river, are being ballasted and put in first-class shape. It is not yet known when the gap between Sandy Bay and Rose du Lac will be closed up. It is not likely to be included in this year's construction operations.

The Department of Railways and Canals, Ottawa, Ont., is calling for bids until Sept. 1 for the construction of the Quebec bridge. The work is advertised in all leading engineering journals of Canada, the United States and Germany, and it is expected that practically every great bridge-building company in the world will submit a tender. The Dominion Bridge Co. of Montreal will, it is understood, make an effort to secure the contract, and the Krupps of Germany, who have the largest iron and steel construction plant in the world, will also tender. Each tenderer must submit a guarantee bond of $1,000,000 to insure the Government against loss.

Construction work on the main line of the Canadian Northern R. R. from Edmonton to the Yellowhead Pass will be commenced at once. The contract for the first section from Edmonton to the Pembina river, a distance of 70 miles, has been awarded to McMillan Bros., who are now on the scene preparing to start work. The whole 70 miles will be graded as rapidly as possible and the company hope to have the rails laid before Christmas. The contract for the line from near Stettler to the Brazlau coal fields will be let shortly.

The Alberta Central R. R., which proposes a line from Red Sash to Rocky Mountain House, B. C., with a branch to Moose Jaw, has awarded the contract for the first 70 miles of line.

The citizens of Saskatoon, Sask., have voted to make a contract with Saskatchewan Power Co. This means that the Saskatchewan River at this point will be harnessed in no distant future to provide cheap electrical energy with which to drive the present industrial concerns, as well as to offer power at minimum cost to manufacturers intending to locate in the west. The company is to build a generating plant 12 miles below the city, at a cost somewhere in the neighborhood of $1,000,000.

Mexican Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Subsidies aggregating about $5,000 per mile have been assured for the projected railway to be built for Edwardo Hartmann and Mexican capitalists. The line will be 450 miles long, and will extend across a stretch of Mexico, running within about 100 miles of the United States frontier. The survey for the proposed road was made several months ago, and it was found that no construction difficulties stood in the way of obtaining a low-grade line the whole distance. The road will run from Monclova, on the International line of the National Railways of Mexico, to Chihuahua, where it will connect with the Mexican Central line of the government merger system.

A tract of land comprising 400,000 acres has been purchased near Torreon, Coah, and arrangements are being made for the colonization of the tract with Americans. The El Paso R. R. runs through the tract and within the boundaries of the property on the line are four towns, Conejo, Yermo, Cabellos and Zavalza. The distance between the first and last named villages is 40 kilometers. An irrigation project has been decided upon by the company and it is said several millions of dollars have been set aside for the improvement.

David Coe, City of Mexico, is now working on a re-survey of the two optional routes for the Veracruz, Tabasco & Campeche R. R., for which a concession was recently granted by the Mexican federal government to the Veracruz, Tabasco & Campeche Railway Construction Co., City of Mexico. Decision as to the route will not be reached before Aug. 15.

Two routes are now being surveyed for the proposed link to connect the Guatemala Central and the Pan-American railroads. One is to run through the mountain coffee district and the other through the low land. It is probable that the higher route will be selected. The line will be 46 miles long, whichever of the two routes is followed.

The Southern Pacific Co., is now said to be considering important changes in its railroad construction plans in Mexico. The report of the engineers on the proposed route across the Sierras Madres, between Orendain and Tepic, is said to show that the cost of constructing this division will be very heavy on account of the great barrancas that must be crossed and many mountains that must be tunneled. In order to avoid these physical obstacles the matter of abandoning the route across the Sierras Madres, between Orendian from Tepic down the Pacific Coast to Manzanillo is said to be under consideration. At Manzanillo connection would be made with the Mexican Central line of the National Railways of Mexico that runs to Guadalajara. While the distance to Guadalajara would be somewhat longer by the Manzanillo route, the cost of operating the road would be much less than if it is built through the mountains to Orendian, as was originally proposed, it is claimed. Construction is now in progress between the Santiago River and Tepic, and considerable work has been done on the line south from Orendian, a station on the Mexican Central's Ameca branch, 25 miles west of Guadalajara. The Southern Pacific is also considering the proposition of constructing a branch line of road from a point on its Yaqui River line to the City of Chihuahua. The preliminary survey for this proposed road has been made. It will be a direct competitor with the Mexico Northwestern Railroad which is invading Northwestern Mexico by the extension of its system.

BIDS ASKED

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Columbus, Ga.—Until noon, July 18, by W. C. Campbell, supt. Department of Public Works, for the construction of a concrete and steel arch bridge (Melan System) over the Chattahoochee River at Dillingham St. Concrete Steel Engineering Co., Park Row Bldg., New York, N. Y., are the engineers.

Miami, Fla.—Until July, by County Commissioners, for the construction of a bridge across the drainage canal at Boynton, Fla. R. H. Rousseau is chairman.

Des Plaines, Ill.—Until 11 a. m., July 6, by Town Clerk, for the construction of seven concrete culverts. H. L. Emerson, 1118 Chamber of Commerce Bldg., Chicago, Ill., is Engineer.

Freeport, Ill.—Until 2 p. m., July 18, by Board of Local Improvements, for the construction of 300 ft. of 9 ft. culvert. Plans are on file at the office of the city engineer, John A. R. Daniels.

Bluffton, Ind.—Until July 8, by Board of County Commissioners for the construction of 7 county bridges. O. D. Garrett is auditor of Wells County.

Greenfield, Ind.—Until 10 a. m., July 5, by Board of County Commissioners, for the construction of three concrete and steel bridges in Brandywine Township and one in Sugar Creek Township. C. H. Troy is auditor of Hancock County.

Lebanon, Ind.—Until 1 p. m., July 8, by County Commissioners, for the construction of 7 bridges. B. F. Herdrich is auditor of Boone County.

Shelbyville, Ind.—Until 1 p. m., July 6, by Commissioners of Shelby and Johnson Counties at Shelbyville, Ind., for the repair of Cutsinger bridge. G. B. Huntington is auditor of Shelby County.

Solon, Me.—Until 2 p. m., July 23, by Solon Bridge Commission, at the Carratunk House, for furnishing labor and material for the construction of the superstructure of a steel highway bridge over Kennebec River between the towns of Solon and Embden. The structure will be about 480 ft. in length.

Red Lake Falls, Minn.—Until 1 p. m., July 8, by Board of Supervisors of township of Deer Park, for the material and labor necessary for the construction of a steel bridge over Clearwater River between Sections 31 and 32 in the township of Deer Park. C. H. Martz, C. E., is engineer of the work. As planned the structure will be 96 ft. long on steel tube foundations and reinforced concrete backing with 6-ft. wing.

Wylie, Minn.—Until 1 p. m., July 1, by Board of Supervisors of the township of Polk Center, Red Lake County, for the construction of a 35-ft. steel beam bridge.

Greenville, Miss.—Until noon, July 4, by Board of County Supervisors, for the construction of a steel bridge across Bogue Phalia at Ingram. W. W. Miller is clerk of the Board.

Vicksburg, Miss.—Until noon, July 5, by J. D. Laughlin, clerk Board of County Supervisors, for the construction of a new steel and concrete approach to Fisher's Ferry Bridge.

Cincinnati, O.—Until noon, July 8, by Board of County Commissioners, Fred Dreihs, clerk, for the construction, under specifications No. 71, of concrete bridge and widening of road on Harrison Ave., Mt. Washington, in Anderson Township.

Cleveland, O.—Until 11 a. m., July 13, by Board of County Commissioners, for the construction of a bridge per report No. 2658, retaining wall, St. Clair road, Euclid Township. Frank Lander is county surveyor.

Sandusky, O.—Until 10 a. m., July 9, by Board of County Commissioners, for the furnishing labor and material for the construction and erection complete of the substructure and superstructure of a highway bascule bridge and approaches over the Huron River at Van Rensselaer St. crossing, in Huron. The structure, according to the plans, will be 250 ft. long, 20 ft. roadway and 6 ft. sidewalk, with an 11-ft. right of way for street cars. John Deist is auditor of Erie County.

Tiffin, O.—Until 1:30 p. m., July 16, by John H. Lennartz, county auditor, for the necessary labor and material for the construction of new concrete piers under the Heck bridge in Section 25 township, Seneca County, Ohio.

Toledo, O.—Until 10 a. m., July 8, by C. J. Sanzenbacher, county auditor, for the following bridge improvements, each of which will exceed a cost of $1,000: Abutments and bridge over ditch No. 424, on road No. 65, in N. E. ¼ Section 26, T. 9 S., R. 5 E., Richfield Township. Bump or automatic swing bridge on county road No. 555, over the Miami & Erie Canal, on line between river tracts 17 and 18, T. 3, U. S. R., Adams Township.

Fairfax, S. Dak.—Until 2 p. m., July 9, by Ludwig Trautmann, county auditor, for the necessary labor and material for the construction of all bridges, both wood and steel, also repair work as is required by said county, for one year from date.

Bellingham, Wash.—Until noon, July 7, by Board of County Commissioners, for the construction of an additional 220-ft. span on the United States bridge at Deming. The estimated cost of the work is $10,000.

Bellingham, Wash.—Until noon, July 7, by Board of County Commissioners, for the moving of a 150-ft. span of steel across Middle Fork to a point on Riddle Slough. The work is estimated to cost $2,000.

Bellingham, Wash.—Until noon, July 7, by Board of County Commissioners, for replanking the Abbott Road bridge near Lynden.

Spokane, Wash.—Until July 1, by Board of County Commissioners, for the construction of a combination bridge across Latah Creek at Waverly. The structure will be built on tubular concrete piers and will be a 120-ft. span, and will replace the pile trestle washed out last spring.
